## Call Details

Navigation: **System Settings > Line > Add/Edit Trunk Line > SIP Line > Call Details**

These settings are used to control the incoming and outgoing calls that use the SIP line. They also set the SIP headers used on calls and the source for values within those headers.

|                             | Description                                                                      |
|-----------------------------|----------------------------------------------------------------------------------|
| <b>SIP URIs</b>             | These settings are used for general incoming and outgoing calls on the SIP line. |
| <b>SIP Line Appearances</b> | These settings allow the emulation of line appearance operation by the SIP line. |

For details of how these are used as part of call routing, see [Outgoing SIP Call Routing](#) on page 938.

## SIP URIs

For the IP Office, each SIP URI acts as a set of trunk channels. It also sets the content of various SIP headers and how that content is used.

- For outgoing calls, the IP Office maps internal calling or called numbers to headers to match the ITSPs requirements. Outgoing calls are routed to a SIP URI by short codes that match the URIs **Outgoing Group** setting. See [SIP Outgoing Call Routing](#) on page 938.
- For incoming calls, headers in the SIP message are used for call routing. Incoming calls are routed to incoming call routes that match the URI's **Incoming Group** setting. See [SIP Incoming Call Routing](#) on page 946.
- The IP Office supports up to 150 SIP URIs on each SIP line.

### General Settings

| Name                  | Description                                                                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>URI</b>            | This field is for information only and cannot be edited.                                                                                                                                             |
| <b>Incoming Group</b> | Default = 0, Range 0 to 99999.<br><br>This value is used to match incoming to the <b>Line Group ID</b> of an incoming call route entry.                                                              |
| <b>Outgoing Group</b> | Default = 0, Range 0 to 99999.<br><br>Short codes that specify a number to dial to a line specify a <b>Line Group ID</b> . This is used to match to lines with the same <b>Outgoing Group</b> value. |
| <b>Max Sessions</b>   | Default =10<br><br>This field sets the maximum number of simultaneous calls that can use the URI before the system returns busy to any further calls.                                                |
| <b>Credentials</b>    | Default = 0:<None><br><br>This field is used to select from a list of the account credentials configured on the line's <b>SIP Credentials</b> tab.                                                   |

The remaining sections are arranged as a table of values. These set which SIP headers are used for calls routed by the SIP URI entry.

The table also sets the source of the values used in the SIP URI values in those headers. A typical SIP URI takes the following form: `display <sip:content@hostname>` where:

- `display` is the displayed name value for the caller/called party.
- `content` is the call target name or number.
- `hostname` is the host from/to which the calls are sent. For details of how the hostname used by the IP Office system is set. See [Setting the SIP URI Host](#) on page 934.

## Headers

The first column indicates the headers used for calls matched to this SIP URI entry.

| Name                    | Description                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Local URI</b>        | Default = Auto<br>This field sets the <code>From</code> field for outgoing SIP calls using this URI.                     |
| <b>Contact</b>          | Default = Auto<br>This field sets the <code>From</code> field for outgoing SIP calls using this URI.                     |
| <b>P Asserted ID</b>    | Default = Disabled<br>When selected, identity information is provided in <code>P-Asserted-Identity</code> (PAI) headers. |
| <b>P Preferred ID</b>   | Default = Disabled<br>When selected, identity information is provided in a <code>P-Preferred-Identity</code> header.     |
| <b>Diversion Header</b> | Default = Disabled<br>When selected, information from the <code>Diversion</code> Header is provided in the SIP messages. |
| <b>Remote Party ID</b>  | Default = Disabled<br>When selected, <code>Remote Party ID</code> header are provided with calls.                        |

## Display

This column sets the source for the `display` part of the SIP URI used in the selected headers.

| Setting                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Auto</b>              | If <b>Auto</b> is selected, the system automatically determines the appropriate value to use. It uses external numbers when forwarding incoming calls, and internal extension numbers for calls made by a local user. <ul style="list-style-type: none"> <li>On incoming calls, the system looks for matches against extension numbers and system short codes.</li> <li>On outgoing calls, the system allows short code manipulation of the caller number and name. For example: <b>S</b> to explicitly set the caller number, <b>W</b> to set withheld, <b>A</b> to allow (override any previous withhold setting), <b>Z</b> to set the caller name.</li> </ul> |
| <b>Use Internal Data</b> | Use the SIP settings of the user ( <b>User &gt; SIP</b> ), group ( <b>Group &gt; SIP</b> ) or voicemail services ( <b>System &gt; Voicemail &gt; SIP</b> ) making or receiving the call: <ul style="list-style-type: none"> <li>Use the <b>SIP Display Name (Alias)</b> setting.</li> <li>If the Anonymous is selected, use that value instead.</li> </ul>                                                                                                                                                                                                                                                                                                       |
| <b>Manual Entry</b>      | If required, you can manually type in a value to use. The value is then used by other fields configured as <b>Explicit</b> . This is typically used to set the DDI to be associated with SIP line appearances.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

*Table continues...*

| Setting                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Credential Values</b> | <p>If a <b>Credentials</b> entry has been selected above, then the <b>User name</b>, <b>Authentication Name</b> and <b>Contact</b> values from the selected credentials entry can be selected as values. The value is then used by other fields configured as <b>Explicit</b>.</p> <ul style="list-style-type: none"> <li>URI values should only be set using credentials when required by the line provider. For example, some line providers require the <code>From</code> header to always contains the credentials used for registration, whilst other headers are used to convey information about the caller ID.</li> </ul> |

## Content

This column sets the source for the `content` part of the SIP URI used in the selected headers.

| Setting                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Auto</b>              | <p>If <b>Auto</b> is selected, the system automatically determines the appropriate value to use. It uses external numbers when forwarding incoming calls, and internal extension numbers for calls made by a local user.</p> <ul style="list-style-type: none"> <li>On incoming calls, the system looks for matches against extension numbers and system short codes.</li> <li>On outgoing calls, the system allows short code manipulation of the caller number and name. For example: <b>S</b> to explicitly set the caller number, <b>W</b> to set withheld, <b>A</b> to allow (override any previous withhold setting), <b>Z</b> to set the caller name.</li> </ul> |
| <b>Use Internal Data</b> | <p>Use the SIP settings of the user (<b>User &gt; SIP</b>), group (<b>Group &gt; SIP</b>) or voicemail services (<b>System &gt; Voicemail &gt; SIP</b>) making or receiving the call:</p> <ul style="list-style-type: none"> <li>Use the <b>SIP Display Name (Alias)</b> setting.</li> <li>If the Anonymous is selected, use that value instead.</li> </ul>                                                                                                                                                                                                                                                                                                             |
| <b>Manual Entry</b>      | <p>If required, you can manually type in a value to use. The value is then used by other fields configured as <b>Explicit</b>. This is typically used to set the DDI to be associated with SIP line appearances.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Credential Values</b> | <p>If a <b>Credentials</b> entry has been selected above, then the <b>User name</b>, <b>Authentication Name</b> and <b>Contact</b> values from the selected credentials entry can be selected as values. The value is then used by other fields configured as <b>Explicit</b>.</p> <ul style="list-style-type: none"> <li>URI values should only be set using credentials when required by the line provider. For example, some line providers require the <code>From</code> header to always contains the credentials used for registration, whilst other headers are used to convey information about the caller ID.</li> </ul>                                       |

## Field Meaning

These values are used to set the source or value for headers based on the call direction.

| Field                           | Description                                                                    |
|---------------------------------|--------------------------------------------------------------------------------|
| <b>Outgoing Calls</b>           | Set the source for URI header information on outgoing external calls.          |
| <b>Forwarding/<br/>Twinning</b> | Set the source for URI header information on calls being forwarded externally. |
| <b>Incoming Calls</b>           | Set the source for URI header information on incoming external calls.          |

The following values can be selected for the different fields.

| Field                  | Description                                                                                                                                       |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Caller</b>          | Use the values associated with the calling party. For forwarded calls, use the values associated with the party forwarding the call.              |
| <b>Original Caller</b> | For forwarded calls, use the value associated with the original caller.                                                                           |
| <b>Called</b>          | Use the values associated with the called party.                                                                                                  |
| <b>Explicit</b>        | Use the manual entered values from the header <b>Display</b> and <b>Content</b> fields, or the credentials values selected from those drop-downs. |
| <b>None</b>            | Do not send the header.                                                                                                                           |

## SIP Line Appearances

These settings allow the SIP line to emulate the use of line appearances on phones that support line appearance buttons. Those buttons can then be used to make or receive calls. For details, see [SIP Line Appearances](#) on page 961.

SIP line appearances are not supported over a multi-site network/SCN or in resiliency.

#### General Settings

| Name                        | Description                                                                                                                                                                                      |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SIP Line Appearances</b> | Default = Disabled<br>When enabled, SIP line appearances can be configured. Note, if you disable this setting and save the configuration, all configured SIP line appearance values are removed. |
| <b>Incoming Group</b>       | Default = 0, Range 0 to 99999.<br>This value is used to match incoming to the <b>Line Group ID</b> of an incoming call route entry.                                                              |
| <b>Outgoing Group</b>       | Default = 0, Range 0 to 99999.<br>Short codes that specify a number to dial to a line specify a <b>Line Group ID</b> . This is used to match to lines with the same <b>Outgoing Group</b> value. |
| <b>Credentials</b>          | Default = 0:<None><br>This field is used to select from a list of the account credentials configured on the line's <b>SIP Credentials</b> tab.                                                   |
| <b>Max Sessions</b>         | Default = 10<br>This field sets the maximum number of simultaneous calls that can use the URI before the system returns busy to any further calls.                                               |
| <b>Incoming Sessions</b>    | Default = 3<br>The maximum number of incoming call sessions.                                                                                                                                     |
| <b>Outgoing Sessions</b>    | Default = 3<br>The maximum number of outgoing call sessions. .                                                                                                                                   |

The remaining sections are arranged as a table of values. These set which SIP headers are used for calls routed by the SIP URI entry.

The table also sets the source of the values used in the SIP URI values in those headers. A typical SIP URI takes the following form: `display <sip:content@hostname>` where:

- `display` is the displayed name value for the caller/called party.
- `content` is the call target name or number.
- `hostname` is the host from/to which the calls are sent. For details of how the hostname used by the IP Office system is set, see [Setting the SIP URI Host](#) on page 934.

## Headers

The first column indicates the headers used for calls matched to this SIP URI entry.

| Name                    | Description                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Local URI</b>        | Default = Auto<br>This field sets the <code>From</code> field for outgoing SIP calls using this URI.                     |
| <b>Contact</b>          | Default = Auto<br>This field sets the <code>From</code> field for outgoing SIP calls using this URI.                     |
| <b>P Asserted ID</b>    | Default = Disabled<br>When selected, identity information is provided in <code>P-Asserted-Identity</code> (PAI) headers. |
| <b>P Preferred ID</b>   | Default = Disabled<br>When selected, identity information is provided in a <code>P-Preferred-Identity</code> header.     |
| <b>Diversion Header</b> | Default = Disabled<br>When selected, information from the <code>Diversion</code> Header is provided in the SIP messages. |
| <b>Remote Party ID</b>  | Default = Disabled<br>When selected, <code>Remote Party ID</code> header are provided with calls.                        |

## Display

This column sets the source for the `display` part of the SIP URI used in the selected headers.

| Setting     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Auto</b> | <p>If <b>Auto</b> is selected, the system automatically determines the appropriate value to use. It uses external numbers when forwarding incoming calls, and internal extension numbers for calls made by a local user.</p> <ul style="list-style-type: none"> <li>• On incoming calls, the system looks for matches against extension numbers and system short codes.</li> <li>• On outgoing calls, the system allows short code manipulation of the caller number and name. For example: <b>S</b> to explicitly set the caller number, <b>W</b> to set withheld, <b>A</b> to allow (override any previous withhold setting), <b>Z</b> to set the caller name.</li> </ul> |

| Setting                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use Internal Data</b> | Use the SIP settings of the user ( <b>User &gt; SIP</b> ), group ( <b>Group &gt; SIP</b> ) or voicemail services ( <b>System &gt; Voicemail &gt; SIP</b> ) making or receiving the call: <ul style="list-style-type: none"> <li>• Use the <b>SIP Display Name (Alias)</b> setting.</li> <li>• If the Anonymous is selected, use that value instead.</li> </ul>                                                                                                                                                                                                                                                           |
| <b>Manual Entry</b>      | If required, you can manually type in a value to use. The value is then used by other fields configured as <b>Explicit</b> . This is typically used to set the DDI to be associated with SIP line appearances.                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Credential Values</b> | If a <b>Credentials</b> entry has been selected above, then the <b>User name</b> , <b>Authentication Name</b> and <b>Contact</b> values from the selected credentials entry can be selected as values. The value is then used by other fields configured as <b>Explicit</b> . <ul style="list-style-type: none"> <li>• URI values should only be set using credentials when required by the line provider. For example, some line providers require the <b>From</b> header to always contains the credentials used for registration, whilst other headers are used to convey information about the caller ID.</li> </ul> |

## Content

This column sets the source for the `content` part of the SIP URI used in the selected headers.

| Setting                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Auto</b>              | If <b>Auto</b> is selected, the system automatically determines the appropriate value to use. It uses external numbers when forwarding incoming calls, and internal extension numbers for calls made by a local user. <ul style="list-style-type: none"> <li>• On incoming calls, the system looks for matches against extension numbers and system short codes.</li> <li>• On outgoing calls, the system allows short code manipulation of the caller number and name. For example: <b>S</b> to explicitly set the caller number, <b>W</b> to set withheld, <b>A</b> to allow (override any previous withhold setting), <b>Z</b> to set the caller name.</li> </ul> |
| <b>Use Internal Data</b> | Use the SIP settings of the user ( <b>User &gt; SIP</b> ), group ( <b>Group &gt; SIP</b> ) or voicemail services ( <b>System &gt; Voicemail &gt; SIP</b> ) making or receiving the call: <ul style="list-style-type: none"> <li>• Use the <b>SIP Display Name (Alias)</b> setting.</li> <li>• If the Anonymous is selected, use that value instead.</li> </ul>                                                                                                                                                                                                                                                                                                       |
| <b>Manual Entry</b>      | If required, you can manually type in a value to use. The value is then used by other fields configured as <b>Explicit</b> . This is typically used to set the DDI to be associated with SIP line appearances.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Credential Values</b> | If a <b>Credentials</b> entry has been selected above, then the <b>User name</b> , <b>Authentication Name</b> and <b>Contact</b> values from the selected credentials entry can be selected as values. The value is then used by other fields configured as <b>Explicit</b> . <ul style="list-style-type: none"> <li>• URI values should only be set using credentials when required by the line provider. ## Field Meaning

These values are used to set the source or value for headers based on the call direction.

| Field                 | Description                                                           |
|-----------------------|-----------------------------------------------------------------------|
| <b>Outgoing Calls</b> | Set the source for URI header information on outgoing external calls. |
| <b>Incoming Calls</b> | Set the source for URI header information on incoming external calls. |

The following values can be selected for the different fields.

| Field           | Description                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explicit</b> | Use the manual entered values from the header <b>Display</b> and <b>Content</b> fields, or the credentials values selected from those drop-downs. |
| <b>None</b>     | Do not send the header.                                                                                                                           |

|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>VoIP Silence Suppression</b> | <p>Default = Off</p> <p>When enabled, when the IP Office detects silence during an IP call, it does not send any audio data.</p> <ul style="list-style-type: none"> <li>• Lines between IP Office systems using G.711 ignore this feature.</li> <li>• On trunks between networked IP Office systems, you must enable the setting at both ends.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Local Hold Music</b>         | <p>Default = Off.</p> <p>When enabled, if the far end puts the call on HOLD, the system plays music received from far end (SIP Line) to the other end. RTCP reports are sent towards SIP Line. When disabled, the system plays local music to the other endpoint and no RTCP packets are sent to SIP trunk.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Re-Invite Supported</b>      | <p>Default = Off.</p> <p>When enabled, the IP Office can use <i>Re-Invite</i> during a call to change the characteristics of the call. For example, when the target of an incoming call or a transfer does not support the codec originally negotiated on the trunk.</p> <ul style="list-style-type: none"> <li>• Requires the ITSP to also support <i>Re-Invite</i>.</li> <li>• This setting must be enabled for video support.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Codec Lockdown</b>           | <p>Default = Off.</p> <p>After making a SIP offer with a list of codecs, the IP Office expects an answer with a single codec selected from the list. User agents that send an answer with multiple codecs expect to switch to any of those codecs during the call without further negotiation, which the IP Office does not support. Instead, loss of speech occurs if the user agent changes codec without renegotiating.</p> <ul style="list-style-type: none"> <li>• If enabled, when the IP Office receives an answer with multiple codecs, the IP Office sends a <i>re-INVITE</i> and a SIP offer with just one codec.</li> <li>• This option requires <b>Re-Invite Supported</b> enabled.</li> </ul>                                                                                                                                                                                               |
| <b>Allow Direct Media Path</b>  | <p>Default = On</p> <p>This settings controls whether calls between IP endpoints and/or lines must go through the IP Office.</p> <ul style="list-style-type: none"> <li>• If disabled, calls go through the IP Office and use its resources. RTP relay allows calls between devices using the same audio codec to not require a voice compression channel.</li> <li>• If enabled, calls can take routes other than through the IP Office system. Both ends must support direct media and have matching VoIP settings. For example, both ends must use the same protocol (SIP or H.323), same addressing (IPv4 or IPv6), and so on. Otherwise, the call goes through the IP Office system. <ul style="list-style-type: none"> <li>- For extensions, disabling <b>Requires DTMF</b> allows the extension to attempt direct media even if the other end has differing DTMF settings.</li> </ul> </li> </ul> |

## T.38 Fax

Navigation: **System Settings > Line > Add/Edit Trunk Line > SIP Line > SIP T38 Fax**

The settings are available only on IP500 V2 since it can terminate T38 fax. On the **VoIP** settings for the line type, **Fax Transport Support** must be set to **T38** or **T38 Fallback**.

These settings are mergeable.

| Field                     | Description                                                                                                                                                          |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use Default Values</b> | <p>Default = On.</p> <p>If selected, all the fields are set to their default values and greyed out.</p>                                                              |
| <b>T38 Fax Version</b>    | <p>Default = 3.</p> <p>During fax relay, the two gateways will negotiate to use the highest version which they both support. The options are: <b>0, 1, 2, 3</b>.</p> |

**SIP Line Credentials**

Navigation: **System Settings > Line > Add/Edit Trunk Line > SIP Line > SIP Credentials**

These settings in the **SIP Credentials** tab are used to enter the ITSP username and password for the SIP account with the ITSP. If you have several SIP accounts going to the same ITSP IP address or domain name, you can enter up to 30 sets of ITSP account names and passwords on this tab.

Use the **Add**, **Remove**, and **Edit** buttons to manage the set of credentials for the SIP trunk accounts.

**Configuration Settings**

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                        | Descriptions                                                                                                                                                                                                                                                                                                                                 |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Index</b>                 | This number is assigned automatically and cannot be edited. If the <b>From</b> field on the SIP URI being used for the call is set to <b>Use Authentication Name</b> , the registration field of the SIP URI indicates the index number of the SIP credentials to use for calls by that SIP URI.                                             |
| <b>User Name</b>             | This name must be unique and is used to identify the trunk. The name can include the domain if necessary.                                                                                                                                                                                                                                    |
| <b>Authentication Name</b>   | Default = Blank.<br><br>This field can be blank but must be completed if a <b>Password</b> is also specified. This value is provided by the SIP ITSP. Depending on the settings on the <b>Local URI</b> tab associated with the SIP call, it may also be used as the user part of the SIP URI. The name can include the domain if necessary. |
| <b>Contact</b>               | Default = Blank.<br><br>This field is used to enter a contact and can include the domain if necessary.                                                                                                                                                                                                                                       |
| <b>Password</b>              | Default = Blank.<br><br>This value is provided by the SIP ITSP. If a password is specified, the matching <b>Authentication Name</b> must also be set.                                                                                                                                                                                        |
| <b>Expiration (mins)</b>     | Default = 60 minutes.<br><br>This setting defines how often registration with the SIP ITSP is required following any previous registration.                                                                                                                                                                                                  |
| <b>Registration Required</b> | Default = On.<br><br>If selected, the fields above are used for registration when making calls. If exported or imported as part of a trunk template.                                                                                                                                                                                         |

## SIP Line Advanced

Navigation: **System Settings > Line > Add/Edit Trunk Line > SIP Line > SIP Advanced**

### Additional configuration information

For additional information regarding the **Media Connection Preservation** setting, see [Media Connection Preservation](#) on page 747.

### Configuration settings

These settings are mergeable, with the exception of the **Media Connection Preservation** setting.

- Changing the **Media Connection Preservation** setting requires a “merge with service disruption”. When the configuration file is sent to the system, the SIP trunk is restarted and all calls on the line are dropped.

Offline editing is not required.

### Call Control

| Field                               | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call Initiation Timeout (s)</b>  | Default = 4 seconds. Range = 1 to 99 seconds.<br><br>Sets how long the IP Office system should wait for a response to an attempt to initiate a call before following the alternate routes set in an ARS form.                                                                                                                                                                                        |
| <b>Call Queuing Timeout (m)</b>     | Default = 5 minutes.<br><br><ul style="list-style-type: none"> <li>• For incoming calls, this sets how many minutes the IP Office waits before dropping a call that is waiting for VCM resources or has remained in the unanswered state.</li> <li>• For outgoing calls, this sets how many minutes the IP Office waits for a call to be answered after receiving a provisional response.</li> </ul> |
| <b>Service Busy Response</b>        | Default = 486 - Busy Here (503 - Service Unavailable for the France2 locale).<br><br>For calls that result in a busy response from IP Office, this setting determines the response code. The options are: <ul style="list-style-type: none"> <li>• <b>486 - Busy Here</b></li> <li>• <b>503 - Service Unavailable</b></li> </ul>                                                                     |
| <b>on No User Responding Send</b>   | Default = 408-Request Timeout.<br><br>Specifies the cause to be used when releasing incoming calls from SIP trunks, when the cause of releasing is that user did not respond. The options are 408-Request Timeout or 480 Temporarily Unavailable.                                                                                                                                                    |
| <b>Action on CAC Location Limit</b> | Default = Allow Voicemail<br><br>When set to <b>Allow Voicemail</b> , the call is allowed to go to a user's voicemail when the user's location call limit has been reached. When set to <b>Reject Call</b> , the call is rejected with the failure response code configured in the <b>Service Busy Response</b> field.                                                                               |

*Table continues...*

| Field                               | Description                                                                                                                                                                                                                            |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Suppress Q.850 Reason Header</b> | Default = Off.<br>When SIP calls are released by sending BYE and CANCEL, a release reason header is added to the message. When set to On, the Q.850 reason header is not included.                                                     |
| <b>Emulate NOTIFY for REFER</b>     | Default = Off.<br>Use for SIP providers that do not send NOTIFY messages. When set to On, after IP Office issues a REFER, and the provider responds with 202 ACCEPTED, IP Office will assume the transfer is complete and issue a BYE. |
| <b>No REFER if using Diversion</b>  | Default = Off.<br>When enabled, REFER is not sent on the trunk if the forwarding was done with 'Send Caller ID = Diversion Header'. Applies to Forwards and Twinning.                                                                  |

### Media

| Field                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Allow Empty INVITE</b>    | Default = Off.<br>When set to On, allows 3pcc devices to initiate calls to IP Office by sending an INVITE without SDP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Send Empty re-INVITE</b>  | Default = Off.<br>This option is only available if <b>SIP Line &gt; SIP VoIP &gt; Reinvite Supported</b> is selected.<br>If set to On, when connecting a call between two endpoints, IP Office sends an INVITE without SDP in order to solicit the full media capabilities of both parties.                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Allow To Tag Change</b>   | Default = Off.<br>When set to On, allows the IP Office to change media parameters when connecting a call to a different party than that which was advertised in the media parameters of provisional responses, such as 183 Session Progress.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>P-Early-Media Support</b> | Default = None.<br>The options are: <ul style="list-style-type: none"> <li>• <b>None:</b> IP Office will not advertise support of this SIP header and will always take incoming early media into account regardless of presence of this header</li> <li>• <b>Receive:</b> IP Office will advertise support of this SIP header and will discard incoming early media unless this header is present in the SIP message.</li> <li>• <b>All:</b> IP Office will advertise support of this SIP header, will discard incoming early media unless this header is present in the SIP message and will include this SIP header when providing early media.</li> </ul> |
| <b>Send SilenceSupp=off</b>  | Default = Off.<br>Used for the G711 codec. When checked, the silence suppression off attribute is sent in SDP on this trunk.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Field                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Force Early Direct Media</b>      | Default = Off.<br>When set to On, allows the direct connection of early media streams to IP endpoints rather than anchoring it at the IP Office.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Media Connection Preservation</b> | Default = Disabled.<br>When enabled, allows established calls to continue despite brief network failures. Call handling features are no longer available when a call is in a preserved state. Preservation on public SIP trunks is not supported until tested with a specific service provider.                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Indicate HOLD</b>                 | Default = Off.<br>When enabled, the system sends a HOLD INVITE to the SIP trunk endpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Media Security</b>                | Default = Off<br>When enabled, the IP Office advertises support of this SIP header, to indicate that audio is configured to be secure and is enforced to use SRTP only. This supports the SIP security header defined by RFC3329.<br>This option is available only when: <ul style="list-style-type: none"> <li>• TLS is being used.</li> <li>• <b>Line   SIP Line   VoIP &gt; Media Security</b> is selected and set to <b>Enforced</b>.</li> <li>• <b>Line   SIP Line   VoIP &gt; Fax Transport Support</b> is not set to <b>T38</b> or <b>T38 Fallback</b>.</li> </ul> When the configuration file is sent to the system, the SIP trunk is restarted and all calls on the line are dropped. |

## Calling Number Verification

These settings configure the SIP trunks use of STIR protocols for calling number verification.

For more details, see [SIP Calling Number Verification \(STIR/SHAKEN\)](#) on page 963.

| Field                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Calling Number Verification</b> | Default = Off<br>Sets whether the line uses calling number verification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Incoming Calls Handling</b>     | Default = <b>Allow Not Failed</b><br>Set which calls are accepted by the system based on the attestation level of the call. <ul style="list-style-type: none"> <li>• <b>System</b> - Use the default system setting (<b>System VoIP &gt; VoIP Security &gt; Calling Number Verification</b>).</li> <li>• <b>Allow All</b> - Allow all calls regardless of calling number verification.</li> <li>• <b>Allow Validated</b> - Only accept verified calls with full or partial attestation.</li> <li>• <b>Allow Not Failed</b> - Accept all calls except those that specifically failed verification. Note this can include calls with no reported verification result.</li> </ul> |

## Identity

| Field                          | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use Phone Context</b>       | Default = Off.<br>When enabled, signals SIP enabled PBXs that the call routing identifier is a telephone number.                                                                                                                                                                                                                                                                                           |
| <b>Add user=phone</b>          | Default = Off.<br>This setting is available when <b>Use Phone Context</b> is enabled.<br>When enabled, this setting adds the SIP parameter <b>User</b> with value <b>Phone</b> to the <i>From</i> and <i>To</i> SIP headers of outgoing calls.                                                                                                                                                             |
| <b>Use + for International</b> | Default = Off.<br>When enabled, outgoing international calls use E.164/International format with + followed by the country code and then the telephone number.                                                                                                                                                                                                                                             |
| <b>Use PAI for Privacy</b>     | Default = Off.<br>When enabled, if the caller ID is withheld: <ul style="list-style-type: none"> <li>• The SIP message <i>From</i> header is made anonymous</li> <li>• The caller identity is inserted into the <i>P-Asserted-Identity</i> header.</li> </ul> This should only be used in a trusted network and must be stripped out of the SIP message before it is forwarded outside the trusted domain. |
| <b>Use Domain for PAI</b>      | Default = Off. <ul style="list-style-type: none"> <li>• When disabled, the DNS resolved IP address of the ITSP Proxy is used for the host part in the <i>P-Asserted-Identity</i> header.</li> <li>• When enabled, the Domain is used.</li> </ul>                                                                                                                                                           |
| <b>Caller ID FROM Header</b>   | Default = Off.<br>Incoming calls can include caller ID information in both the <i>From</i> field and in the <i>PAI</i> fields. When this option is enabled, the caller ID information in the <i>From</i> field is used rather than that in the <i>PAI</i> fields.                                                                                                                                          |
| <b>Send From In Clear</b>      | Default = Off.<br>When enabled, the user ID of the caller is included in the <i>From</i> field. This applies even if the caller has selected to be or is configured to be anonymous. However, their anonymous state is still honored in other fields used to display the caller identity.                                                                                                                  |
| <b>Cache Auth Credentials</b>  | Default = On.<br>When enabled, credentials challenge and response information from a registration transaction is cached by the IP Office and automatically inserted into later SIP messages without waiting for a subsequent challenge. This speeds up connections but must be supported by the other end of the connection.                                                                               |
| <b>Add UUI header</b>          | Default = Off.<br>When enabled, the User-to-User Information (UUI) is passed in SIP headers to applications.                                                                                                                                                                                                                                                                                               |

*Table continues...*

| Field                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Add UI header to redirected calls</b> | <p>Default = Off.</p> <p>When enabled, the UI is passed in SIP headers for calls that are redirected. For example, on forwarded and twinned calls.</p> <p>This field can be enabled if <b>Add UI header</b> is enabled.</p>                                                                                                                                                                                                                                                                                                                                       |
| <b>User-Agent and Server Headers</b>     | <p>Default = Blank (Use system type and software level).</p> <p>The value set in this field is used as the <i>User-Agent</i> and <i>Server</i> value included in SIP request headers made the line.</p> <ul style="list-style-type: none"> <li>• If blank, the type of IP Office system and its software level are used.</li> <li>• Setting a unique value can be useful in call diagnostics when the IP Office has multiple SIP trunks.</li> </ul>                                                                                                               |
| <b>Send Location Info</b>                | <p>Default = Never.</p> <p>This option is useable with SIP ISPs that support RFC 4119/RFC 5139. When enabled, emergency calls send the address information associated with the dialing extension's location. See <a href="#">Configuration for Emergency Calls</a> on page 776.</p> <p>The options are:</p> <ul style="list-style-type: none"> <li>• <b>Never:</b> Do not send location information.</li> <li>• <b>Emergency Calls:</b> For <b>Dial Emergency</b> calls, send the address information configured for the dialing extension's location.</li> </ul> |

## Association Method

When the IP Office receives an incoming SIP call, it needs to match the call to one of its SIP line.

- Lines are checked for a match in **Line Number** order until a match occurs.
- The method used to check for a match on a line uses the line's **Association Method**.
- If no match occurs on any line, the request is ignored.

This process enables support of multiple SIP lines with the same address settings. For example, for scenarios that require support of multiple SIP lines from the same ITSP. That can occur when the same ITSP supports different call plans on separate lines, or where all outgoing SIP lines are routed from the system through an additional on-site system.

| Field                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>By Source IP Address</b>                                    | <p>Uses the source IP address and port of the incoming request for association. The match is against the configured remote end of the SIP line, using either an IP address/port or resolution of an FQDN. For UDP calls, the local <b>Listen Port</b> is also used for the match.</p> <ul style="list-style-type: none"> <li>For TCP/TLS connections, the IP Office establishes a connection to the remote address and port specified on the SIP line.</li> <li>For UDP, non-call dialogs and call starting dialogs must use the remote address and port specified on the SIP line.</li> </ul> <p>It is recommended that the remote end does not change these value as that may prevent NAT traversal.</p> |
| <b>"From" header hostpart against ITSP domain</b>              | <p>Uses the host part of the <code>From</code> header in the incoming SIP request for association.</p> <ul style="list-style-type: none"> <li>The match is against the <b>Line &gt; SIP Line &gt; ITSP Domain Name</b>.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>R-URI hostpart against ITSP domain</b>                      | <p>Uses the host part of the <code>Request-URI</code> header in the incoming SIP request for association.</p> <ul style="list-style-type: none"> <li>The match is against the <b>Line &gt; SIP Line &gt; ITSP Domain Name</b>.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>"To" header hostpart against ITSP domain</b>                | <p>Uses the host part of the <code>To</code> header in the incoming SIP request for association.</p> <ul style="list-style-type: none"> <li>The match is against the <b>Line &gt; SIP Line &gt; ITSP Domain Name</b>.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>"From" header hostpart against DNS-resolved ITSP domain</b> | <p>Uses the host part of the <code>From</code> header in the incoming SIP request for association.</p> <ul style="list-style-type: none"> <li>The match is found by comparing the <code>From</code> header against the IP address resolution of the <b>Line &gt; SIP Line &gt; ITSP Domain Name</b> or, if set, the <b>Line &gt; SIP Transport &gt; ITSP Proxy Address</b> setting.</li> </ul>                                                                                                                                                                                                                                                                                                             |
| <b>"Via" header hostpart against DNS-resolved ITSP domain</b>  | <p>Uses the host part of the <code>VIA</code> header in the incoming SIP request for association.</p> <ul style="list-style-type: none"> <li>The match is found by comparing the <code>VIA</code> header against the IP address resolution of the <b>Line &gt; SIP Line &gt; ITSP Domain Name</b> or, if set, the <b>Line &gt; SIP Transport &gt; ITSP Proxy Address</b> setting.</li> </ul>                                                                                                                                                                                                                                                                                                               |
| <b>"From" header hostpart against ITSP proxy</b>               | <p>Uses the host part of the <code>From</code> header in the incoming SIP request for association.</p> <ul style="list-style-type: none"> <li>The match is against the <b>Line &gt; SIP Transport &gt; ITSP Proxy Address</b> setting.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>"To" header hostpart against ITSP proxy</b>                 | <p>Uses the host part of the <code>From</code> header in the incoming SIP request for association.</p> <ul style="list-style-type: none"> <li>The match is against the <b>Line &gt; SIP Transport &gt; ITSP Proxy Address</b> setting.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>R-URI hostpart against ITSP proxy</b>                       | <p>Uses the host part of the <code>Request-URI</code> in the incoming SIP request for association.</p> <ul style="list-style-type: none"> <li>The match is against the <b>Line &gt; SIP Transport &gt; ITSP Proxy Address</b> setting.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Addressing

| Field                           | Description                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call Routing Method</b>      | Default = Request URI.<br><br>This field selects which incoming SIP information is used for incoming number matching by the IP Office to route incoming calls. The options are to match the <b>Request URI</b> or the <b>To Header</b> element provided with the incoming call.                                                                                                                                 |
| <b>Use P-Called-Party</b>       | Default = Off.<br><br>When enabled, IP Office reads the <code>P-Called-Party-ID</code> header if present in the SIP message and routes the incoming SIP calls based on it. The feature can be enabled on public SIP trunk interfaces.<br><br>If enabled and the header is not present in the SIP message, the IP Office uses the header configured in the <b>Call Routing Method</b> for incoming call routing. |
| <b>Suppress DNS SRV Lookups</b> | Default = Off.<br><br>Controls whether to send SRV queries for this endpoint, or just NAPTR and A record queries.                                                                                                                                                                                                                                                                                               |

## SIP Line Engineering

Navigation: **System Settings > Line > Add/Edit Trunk Line > SIP Line > SIP Engineering**

You can use this tab to enter commands that apply special features to the SIP line. The commands are called SIP Line Custom (SLIC) strings.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

### reINVITE Codec Renegotiation

For R11.0 and higher, the IP Office supports codec renegotiation when a `reINVITE` is received. See [Codec selection](#) on page 954.

You can use the following command to retain the pre-R11.0 behavior of no renegotiation. Note: On existing IP Office systems upgraded to R11.0 or higher, this command is automatically added to all existing SIP lines.

- `SLIC_PREFER_EXISTING_CODEC`

### Calling Number Validation

You can use the following commands to control calling number validation. See [SIP Calling Number Verification \(STIR/SHAKEN\)](#) on page 963.

- `SLIC_STIR_REJECT_CODE=<n>` where `<n>` is the response code sent for calls rejected by the IP Office.
- `SLIC_STIR_REJECT_STRING=<y>` where `<y>` is the response string sent for calls rejected by the IP Office.

- `SLIC_STIR_ATTEST=<w>` where `<w>` is the name of the header the IP Office checks for a call's authorization level.
- `SLIC_STIR_CUSTOM=<z>` where `<z>` value enables or disables various call features.

## Server Name Identification (SNI)

The following SLIC codes can be used for SIP trunks using TLS. When used:

- On outgoing connections, the IP Office adds Server Name Indication (SNI) information to the SAN field it sends.
- If the IP Office system's **Received certificate checks (Telephony endpoints)** settings is set to **Medium + Remote Checks** or **High + Remote Checks**, then the SLIC value is also used to validate the received certificates SAN.

The SLIC codes are:

- `SLI_ADD_SIP_SAN=<X>`

Use a SNI set to `sip:<SNI>` where the `<SNI>` value is taken from the existing IP Office SIP line configuration based on the following values of `<X>` as below:

- **D** = Use the value of the SIP line's **ITSP Domain Name** setting (**Line > SIP Line**). For example, for a SIP line with the **ITSP Domain Name** set to `ipo.example.com`, adding `SLIC_ADD_SIP_SAN=D` sets the SNI added to `sip:ipo.example.com`.
- **P** = Use the value of the SIP line's configured **ITSP Proxy Address** setting (**Line > Transport >** ). This option is only supported for a **ITSP Proxy Address** set to a single address. For example: `SLI_ADD_SIP_SAN=P`

## Keepalives

Supported with IP Office R11.1.3.1 and higher.

You can add `SLIC_HNT_EMPTY_PACKET` to have the SIP line send RTP packets with payload 20 (unassigned payload) and no data as keepalives. This overrides the default of send STUN packets for keepalives.

| Variable                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Add 'Not-end-to-end ISDN' Information Element</b> | <p>Default = Never*.</p> <p>Sets whether the optional 'Not end-to-end ISDN' information element should be added to outgoing calls on the line. The options are: <b>Never</b>, <b>Always</b>, <b>POTS</b> (only if the call was originated by an analog extension).</p> <p>*The default is <b>Never</b> except for the following locales; for Italy the default is <b>POTS</b>, for New Zealand the default is <b>Always</b>.</p>                                                                                                                                                                                                                                                                                                                                     |
| <b>Progress Replacement</b>                          | <p>Default = None.</p> <p>Progress messages are defined in the Q.931 ISDN connection control signaling protocol. Generally, if a progress message is sent, the caller does not get connected and so typically does not accrue call costs.</p> <p>Not all ISDN lines support Q.931 Progress messages. Use this setting to configure alternative signaling to the ISDN line for internally generated Progress messages. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Alerting</b>: Map to Q.931 Alerting. The call is not connected. The caller does not hear the message and typically does not accrue call costs.</li> <li>• <b>Connect</b>: Map to Q.931 Connect. The caller hears the message and typically will accrue call costs.</li> </ul> |
| <b>Send Redirecting Number</b>                       | <p>Default = Off.</p> <p>This option can be used on ISDN trunks where the redirecting service is supported by the trunk provider. Where supported, on twinned calls the caller ID of the original call is passed through to the twinning destination. This option is only used for twinned calls.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Send Names</b>                                    | <p>This option is available when the <b>Switch Type</b> above is set to <b>DMS100</b>. If set, names are sent in the display field. The <b>Z</b> shortcode character can be used to specify the name to be used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Names Length</b>                                  | <p>Set the allowable length for names, up to 15 characters, when <b>Send Names</b> is set above.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Test Number</b>                                   | <p>Used to remember the external telephone number of this line to assist with loop-back testing. For information only.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Framing</b>                                       | <p>Default = ESF</p> <p>Selects the type of signal framing used (ESF or D4).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Clock Quality</b>                                                | <p>Default = Network</p> <p>Refer to the IP Office Installation Manual for full details. This option sets whether the system should try to take its clock source for call synchronization and signalling from this line. Preference should always be given to using the clock source from a central office exchange if available by setting at least one exchange line to <b>Network</b>.</p> <ul style="list-style-type: none"> <li>• If multiple lines are set as <b>Network</b>, the order in which those lines are used is described in the IP Office Installation Manual. If additional lines are available, <b>Fallback</b> can be used to specify a clock source to use should the <b>Network</b> source not be available.</li> <li>• Lines from which the clock source should not be taken should be set as <b>Unsuitable</b>.</li> <li>• If no clock source is available, the system uses its own internal 8KHz clock source.</li> <li>• In scenarios where several systems are network via digital trunk lines, care must be taken to ensure that all the systems use the same clock source. The current source being used by a system is reported within the System Status Application.</li> </ul> |
| <b>CSU Operation</b>                                                | Tick this field to enable the T1 line to respond to loop-back requests from the line.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## T1 ISDN TNS

Navigation: **System Settings > Line > T1 ISDN TNS**

This tab is shown when the line Provider is set to AT&T. It allows the entry of the Network Selection settings. These are prefixes for alternative long distance carriers. When a number dialed matches an entry in the table, that pattern is stripped from the number before being sent out. This table is used to set field in the TNS (Transit Network Selection) information element for 4ESS and 5ESS exchanges. It is also used to set fields in the NSF information element.

These settings must be edited offline. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

| Field           | Description                                                                                                                                                                                   |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>TNS Code</b> | The pattern for the alternate long distance carrier. For example: The pattern 10XXX is added to this tab. If 10288 is dialed, 10 is removed and 288 is placed in the TNS and NSF information. |

## T1 ISDN Special

Navigation: **System Settings > Line > T1 ISDN Special**

This tab is shown when the line Provider is set to AT&T. This table is used to set additional fields in the NSF information element after initial number parsing by the TNS tab. These are used to indicate the services required by the call. If the channel is set to Call by Call, then further parsing is done using the records in the Call by Call tab.

These settings must be edited offline. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

| Field             | Description                                                                                                                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Short code</b> | The number which results from the application of the rules specified in the User or System Short code tables and the Network Selection table and the Call-by-call table to the number dialed by the user. |
| <b>Number</b>     | The number to be dialed to line.                                                                                                                                                                          |
| <b>Special</b>    | Default = No Operator.<br>The options are: <b>No Operator</b> , <b>Local Operator</b> or <b>Presubscribed Operator</b> .                                                                                  |
| <b>Plan</b>       | Default = National.<br>The options are: <b>National</b> or <b>International</b> .                                                                                                                         |

Typical values are:

| Short Code  | Number | Service                          |
|-------------|--------|----------------------------------|
| <b>011N</b> | N      | No Operator, International       |
| <b>010N</b> | N      | Local Operator, International    |
| <b>01N</b>  | N      | Local Operator, National         |
| <b>00N</b>  | N      | Presubscribed Operator, National |
| <b>0N</b>   | N      | Presubscribed Operator, National |
| <b>1N</b>   | 1N     | No operator, National            |

## Call By Call (US PRI)

Navigation: **System Settings > Line > T1 ISDN Call by Call**

This tab is shown when the line Provider is set to AT&T. Settings in this tab are only used when calls are routed via a channel which has its **Service** set to **Call by Call**.

It allows short codes to be created to route calls to a different services according to the number dialed. Call By Call reduces the costs and maximizes the use of facilities. Call By Call chooses the optimal service for a particular call by including the Bearer capability in the routing decision. This is particularly useful when there are limited resources.

These settings must be edited offline. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

| Field             | Description                                                                                                                                                                                                                                                                                                                                                                                                                     |

## SM Line

Navigation: **System Settings > Line > Add/Edit Trunk Line > SM Line**

This type of line is used to create a SIP connection between an IP Office and an Avaya Aura® Session Manager. The other end of the SIP connection must be configured on the Session Manager as a SIP Entity Link.

An SM Line can only be added to IP Office system Standard Mode or Server Edition configurations. It is typically used in IP Office Standard mode in Enterprise Branch deployments connected to the Avaya Aura® network. For more details about IP Office Enterprise Branch deployments refer to *Deploying Avaya IP Office™ Platform as an Enterprise Branch with Avaya Aura® Session Manager*.

An SM Line can also be used in IP Office Server Edition to connect to an Avaya Aura® Session Manager. Through the SM Line, IP Office Server Edition supports interoperability with Avaya Aura® Session Manager. It also supports interoperability, via the Avaya Aura® Session Manager, with Avaya Aura® Communication Manager systems and with CS 1000 systems. Note that IP Office Server Edition is not used as an enterprise branch product and does not support some of the IP Office enterprise branch functionality, such as management by Avaya Aura® System Manager, WebLM licensing, Centralized Users or voicemail over the SM Line.

If the Avaya Aura® network has multiple Avaya Aura® Session Managers to provide redundancy, two SM lines can be added, one configured for each Avaya Aura® Session Manager.

Navigation: **System Settings > Line > Add/Edit Trunk Line > SM Line > Session Manager**

### Additional configuration information

For additional information regarding the **Media Connection Preservation** setting, see [Media Connection Preservation](#) on page 747.

### Configuration settings

These settings cannot be edited online. Changes to these settings require a reboot of the system.

Changing the **In Service** setting to **Disabled** (out of service) requires a system reboot. However, changing the **In Service** setting to **Enabled** is mergeable. Configuration changes made while the line is out of service are also mergeable.

| Field                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Line Number</b>       | <p>Default = Auto-filled. Range = 1 to 249 (<i>IP500 V2</i>)/349 (<i>Server Edition</i>).</p> <p>Enter the line number that you wish. Note that this must be unique. On IP500 V2 systems, line numbers 1 to 16 are reserved for internal hardware.</p> <ul style="list-style-type: none"> <li>• <b>Session Manager line prioritization:</b> Up to two Session Manager lines can be configured. The two Session Manager lines are prioritized based on the line number. The lower line number is considered the primary Session Manager line. For example, if the first Session Manager line is configured as line number 17 and the second Session Manager line is configured as line 18, then line number 17 is considered the primary Session Manager line. If you want to designate the second Session Manager line (line 18 in this example) as the primary Session Manager line, you must change one or both of the line numbers so that the second Session Manager line is configured with a lower number than the current primary line.</li> <li>• <b>Session Manager line redundancy:</b> Based on the priority of the Session Manager lines designated by the line number, the active line to which the IP Office&gt; sends all calls will always be the highest priority Session Manager line in service. That is, if the primary Session Manager line is in service, it will be the active line for sending calls. If the connection to the primary Session Manager line is lost, causing the IP Office to switch to the secondary Session Manager line, then when the primary line comes back up later, the IP Office reverts back to the primary Session Manager line.</li> </ul> |
| <b>In Service</b>        | <p>Default = Enabled</p> <p>This option can be used to administratively disable the SM Line. It does not reflect the dynamic state of the line. If an SM Line is administratively disabled it is not equivalent to being in the dynamic out of service state.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>SM Domain Name</b>    | This should match a SIP domain defined in the Session Manager system's SIP Domains table. Unless there are reasons to do otherwise, all the Enterprise Branch systems in the Avaya Aura® network can share the same domain.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>SM Address</b>        | Enter the IP address of the Session Manager the line should use in the Avaya Aura network. The same Session Manager should be used for the matching <b>Entity Link</b> record in the Avaya Aura® configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Outgoing Group ID</b> | <p>Default = 98888</p> <p>This value is not changeable. However note the value as it is used in Enterprise Branch short codes used to route calls to the Session Manager.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Prefix</b>            | <p>Default = Blank</p> <p>This prefix will be added to any source number received with incoming calls.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Max Calls</b>         | <p>Default = 10</p> <p>Sets the number of simultaneous calls allowed between the Enterprise Branch and Session Manager using this connection. Each call will use one of the available licenses that are shared by all SIP trunks configured in the system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Allow Direct Media Path</b>        | <p>Default = On</p> <p>This settings controls whether calls between IP endpoints and/or lines must go through the IP Office.</p> <ul style="list-style-type: none"> <li>• If disabled, calls go through the IP Office and use its resources. RTP relay allows calls between devices using the same audio codec to not require a voice compression channel.</li> <li>• If enabled, calls can take routes other than through the IP Office system. Both ends must support direct media and have matching VoIP settings. For example, both ends must use the same protocol (SIP or H.323), same addressing (IPv4 or IPv6), and so on. Otherwise, the call goes through the IP Office system.</li> <li>- For extensions, disabling <b>Requires DTMF</b> allows the extension to attempt direct media even if the other end has differing DTMF settings.</li> </ul> |
| <b>Re-Invite Supported</b>            | <p>Default = Off.</p> <p>When enabled, the IP Office can use <code>Re-Invite</code> during a call to change the characteristics of the call. For example, when the target of an incoming call or a transfer does not support the codec originally negotiated on the trunk.</p> <ul style="list-style-type: none"> <li>• Requires the ITSP to also support <code>Re-Invite</code>.</li> <li>• This setting must be enabled for video support.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Codec Lockdown</b>                 | <p>Default = Off.</p> <p>After making a SIP offer with a list of codecs, the IP Office expects an answer with a single codec selected from the list. User agents that send an answer with multiple codecs expect to switch to any of those codecs during the call without further negotiation, which the IP Office does not support. Instead, loss of speech occurs if the user agent changes codec without renegotiating.</p> <ul style="list-style-type: none"> <li>• If enabled, when the IP Office receives an answer with multiple codecs, the IP Office sends a <code>re-INVITE</code> and a SIP offer with just one codec.</li> <li>• This option requires <b>Re-Invite Supported</b> enabled.</li> </ul>                                                                                                                                               |
| <b>Force direct media with phones</b> | <p>Default = On</p> <p>When enabled, if an Avaya IP phone dials digits during a direct media call, the IP Office changes the call to indirect media and sends the digits as RFC2833. 15-seconds after the last digit, the IP Office changes the call back to direct media.</p> <ul style="list-style-type: none"> <li>• This setting is requires the line to have <b>Re-Invite Supported</b> and <b>Allow Direct Media Path</b> enabled, and <b>DTMF Support</b> set to <b>RFC2833/RF4733</b>.</li> </ul>                                                                                                                                                                                                                                                                                                                                                      |

## SM Line T38 Fax

Navigation: **System Settings > Line > Add/Edit Trunk Line > SM Line > SM Line T38 Fax**

The settings are available only on IP500 V2 since it can terminate T38 fax. On the **VoIP** settings for the line type, **Fax Transport Support** must be set to **T38** or **T38 Fallback**.

These settings are mergeable.

# Chapter 28: Locations

## System Settings > Locations

Location records can be used to identify where particular extensions are physically located and to apply settings that need to differ from that location.

- When **Locations** have been defined, you must configure the system with one of those locations.

For additional configuration information, see:

- [Emergency Call](#) on page 776
- [Configuring Call Access Control](#) on page 831
- [Preventing Toll Bypass](#) on page 829

## Defaults

By default, new lines and extensions are assigned the same location as set for their host IP Office system. However, their location setting can be changed individually. For IP extensions, the location can also be set to automatically by matching the IP extension's current IP address to the address settings of an existing location.

## Networked Configurations

In networked IP Office configurations, each location entry and its settings are automatically replicated in the configuration of all IP Office systems in the network. The exception is the **Emergency ARS** setting which can be configured separately for the same location entry on each system.

---

## Location

Navigation: **System Settings > Locations > Add/Edit Location > Locations**

You can use locations to apply a range of common settings to IP Office systems, extensions, and IP lines in the same physical location. For example, each location can define the timezone settings applied to extensions in that location. See [Using Locations](#) on page 743.

- When you have defined any **Location** entries, you must assign locations to each IP Office system in the network.

## Settings

You can edit these settings online without needing to reboot the IP Office.

| Field                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Subnet Address (IPv6)</b> | <p>Default = Blank (Not used)</p> <p>The IPv6 subnet address for extensions in the location.</p> <ul style="list-style-type: none"> <li>• The value must be <u>unique</u> for each location. If there are overlapping IP address ranges, extensions will use the first match found which may not be the correct location.</li> <li>• If also using IPv4 <b>Subnet Address</b> and <b>Subnet Mask</b> to match extensions to a location, you need to create a separate location entry for IPv6 <b>Subnet Address (IPv6)/Prefix</b> extension IP address matching.</li> <li>• Supported on Linux-based IP Office R12.1 systems only. To enable IPv6 support, select <b>LAN1 &gt; LAN Setting (IPv6) &gt; IPv6</b> and/or <b>LAN2 &gt; LAN Setting (IPv6) &gt; IPv6</b>.</li> </ul> |
| <b>Prefix</b>                | <p>Default = 64. Range 1 to 128.</p> <p>The prefix for the IPv6 sub-net address above.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Emergency ARS</b>         | <p>Default = None.</p> <p>This setting sets which ARS entry the IP Office should use to route emergency calls made from the location. Refer to the <i>IP Office Emergency Call Configuration</i> manual.</p> <p>When the dialing on an extension associated with the location matches a <b>Dial Emergency</b> short code, this setting overrides the <b>Line Group ID</b> setting of the short code.</p>                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Fallback System</b>       | <p>Default = No override.</p> <p>The list contains all configured IP Office lines and the associated IP Office system. The group of extensions associated with this location can fallback to the selected IP Office system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Call Admission Control

The call admission control (CAC) settings allow you to control the number of IP trunk calls between locations. See [Configuring Call Admission Control](#) on page 831.

| Field                          | Description                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Total Maximum Calls</b>     | Default = Unlimited. ## Address

Navigation: **System Settings > Locations > Add/Edit Location > Address**

This information is used for SIP lines to an E911 service supporting RFC 4119 and RFC 5139. On emergency calls, the address information is included in the INVITE message.

To use the information, the **System Settings > Line > Add/Edit Trunk Line > SIP Line > SIP Advanced > Send Location Info** settings must be enabled.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field               | Description                                                  | Example               |
|---------------------|--------------------------------------------------------------|-----------------------|
| <b>Country Code</b> | The country is identified by the two letter ISO 3166 code.   | US                    |
| <b>A1</b>           | National subdivisions (state, region, province, prefecture). | New York              |
| <b>A2</b>           | County, parish, gun (JP), district (IN).                     | King's County         |
| <b>A3</b>           | City, township, shi (JP).                                    | New York              |
| <b>A4</b>           | City division, borough, city district, ward, chou (JP).      | Manhattan             |
| <b>A5</b>           | Neighborhood, block.                                         | Morningside Heights   |
| <b>A6</b>           | Street.                                                      | Broadway              |
| <b>RD</b>           | Primary road or street                                       | Broadway              |
| <b>RDSEC</b>        | Trailing street suffix.                                      | SW                    |
| <b>RDBR</b>         | Road branch.                                                 | Lane 7                |
| <b>RDSUBBR</b>      | Road sub-branch.                                             | Alley 8               |
| <b>PRD</b>          | Leading street direction.                                    | N                     |
| <b>POD</b>          | Trailing street suffix.                                      | NE                    |
| <b>STS</b>          | Street suffix.                                               | Avenue, Platz, Street |

# Chapter 29: RAS

## System Settings > RAS

A Remote Access Server (RAS) is a piece of computer hardware which sits on a corporate LAN and into which employees dial on the public switched telephone network to get access to their email and to software and data on the corporate LAN.

Click **Add/Edit RAS** to open the **RAS** page where you can provision a **RAS**. When you click **Add/Edit RAS**, you are prompted to specify the server where the **RAS** will be added.

- This type of configuration record is not available on subscription mode systems.

### RAS

A Remote Access Server (RAS) is a piece of computer hardware which sits on a corporate LAN and into which employees dial on the public switched telephone network to get access to their email and to software and data on the corporate LAN.

This form is used to create a RAS service that the system offers Dial In users. A RAS service is needed when configuring modem dial in access, digital (ISDN) dial in access and a WAN link. Some systems may only require one RAS service since the incoming call type can be automatically sensed.

These settings are mergeable. Changes to these settings do not require a reboot of the system.

| Field            | Description                                                                                                                                            |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>      | A textual name for this service. If <b>Encrypted Password</b> below is used, this name must match the <b>Account Name</b> entered in the Service form. |
| <b>Extension</b> | Enter an extension number if this service is to be accessed internally.                                                                                |
| <b>COM Port</b>  | For future use.                                                                                                                                        |

| Field                     | Description                                                                                                                                                                                                                                                                                                       |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>TA Enable</b>          | Default = Off<br>Select to enable or disable - if enabled RAS will pass the call onto a TA port for external handling.                                                                                                                                                                                            |
| <b>Encrypted Password</b> | Default = Off<br>This option is used to define whether Dial In users are asked to use PAP or CHAP during their initial log in to the RAS Service. If the Encrypted Password box is checked then Dial In users are sent a CHAP challenge, if the box is unchecked PAP is used as the Dial In Authorization method. |

## PPP

PPP (Point-to-Point Protocol) is a Protocol for communication between two computers using a Serial interface, typically a personal computer connected by phone line to a server.

These settings are mergeable. Changes to these settings do not require a reboot of the system.

| Field                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CHAP Challenge Interval (secs)</b> | Default = 0 (disabled). Range = 0 to 99999 seconds.<br>The period between successive CHAP challenges. Blank or 0 disables repeated challenges.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Header Compression</b>             | Default = Off<br>Enables the negotiation and use of IP Header Compression as per RFC2507, RFC2508 and RFC2509.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>PPP Compression Mode</b>           | Default = MPPC This option is used to negotiate compression (or not) using CCP. If set to MPPC or StacLZS the system will try to negotiate this mode with the remote Control Unit. If set to Disable CCP is not negotiated. The options are: <ul style="list-style-type: none"> <li>• <b>Disable</b> Do not use or attempt to use compression.</li> <li>• <b>StacLZS</b> Attempt to use and negotiate STAC compression (the standard, Mode 3)</li> <li>• <b>MPPC</b> Attempt to use and negotiate MPPC (Microsoft) compression. Useful for dialing into NT Servers.</li> </ul> |

# Chapter 30: Services

Navigation Path: **System Settings > Services**

Services are used to configure the settings required when a user or device on the LAN needs to connect to a off-switch data service such as the Internet or another network. Services can be used when making data connections via trunk or WAN interfaces.

After creating a service, it can be used as the destination for an IP Route record. One service can also be set as the **Default Service**. That service will then be used for any data traffic received by the system for which no IP Route is specified.

The system supports the following types of service:

| Service                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Remote Support Services</b> | This type of tunnel is used by subscription mode IP Office systems for RSS connections routed to the system through COM. For details, refer to <i>Using Customer Operations Manager for IP Office Subscription Systems</i> .                                                                                                                                                                                                                     |
| <b>Normal Service</b>          | This type of service should be selected when for example, connecting to an ISP.                                                                                                                                                                                                                                                                                                                                                                  |
| <b>WAN Service</b>             | This type of service is used when creating a WAN link. A User and RAS Service will also be created with the same name. These three records are automatically linked and each open the same form. Note however, that this type of Service cannot be used if the Encrypted Password option is checked. In this case, the RAS Service name must match the Account Name. Therefore either create each record manually or create an Intranet Service. |
| <b>Intranet Service</b>        | This type of service can be selected to automatically create a User with the same name at the same time. These two records are linked and will each open the same form. The User's password is entered in the Incoming Password field at the bottom on the Service tab. An Intranet Services shares the same configuration tabs as those available to the WAN Service.                                                                           |
| <b>SSL VPN</b>                 | The SSL VPN service provides secure tunneling between the Avaya IP Office hardware installed at a customer site and a remote Avaya VPN Gateway (AVG). This secure tunnel allows support personnel to offer remote management services to customers, such as fault management, monitoring, and administration. Refer to the <i>Deploying Avaya IP Office™ Platform SSL VPN Services</i> manual.                                                   |

### Additional configuration information

This type of configuration record can be saved as a template and new records created from a template. See [Working with Templates](#) on page 810.

### Configuration settings

Services are used to configure the settings required when a user or device on the LAN needs to connect to a off-switch data service such as the Internet or another network. Services can be used when making data connections via trunk or WAN interfaces.

After creating a service, it can be used as the destination for an IP Route record. One service can also be set as the **Default Service**. That service will then be used for any data traffic received by the system for which no IP Route is specified.

The system supports the following types of service:

| Service                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Remote Support Services</b> | This type of tunnel is used by subscription mode IP Office systems for RSS connections routed to the system through COM. For details, refer to <i>Using Customer Operations Manager for IP Office Subscription Systems</i> .                                                                                                                                                                                                                     |
| <b>Normal Service</b>          | This type of service should be selected when for example, connecting to an ISP.                                                                                                                                                                                                                                                                                                                                                                  |
| <b>WAN Service</b>             | This type of service is used when creating a WAN link. A User and RAS Service will also be created with the same name. These three records are automatically linked and each open the same form. Note however, that this type of Service cannot be used if the Encrypted Password option is checked. In this case, the RAS Service name must match the Account Name. Therefore either create each record manually or create an Intranet Service. |
| <b>Intranet Service</b>        | This type of service can be selected to automatically create a User with the same name at the same time. These two records are linked and will each open the same form. The User's password is entered in the Incoming Password field at the bottom on the Service tab. An Intranet Services shares the same configuration tabs as those available to the WAN Service.                                                                           |
| <b>SSL VPN</b>                 | The SSL VPN service provides secure tunneling between the Avaya IP Office hardware installed at a customer site and a remote Avaya VPN Gateway (AVG). This secure tunnel allows support personnel to offer remote management services to customers, such as fault management, monitoring, and administration. Refer to the <i>Deploying Avaya IP Office™ Platform SSL VPN Services</i> manual.                                                   |

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field               | Description                                                                           |
|---------------------|---------------------------------------------------------------------------------------|
| <b>Service Name</b> | The name of the service. It is recommended that only alphanumeric characters be used. |

*Table continues...*

| Field                     | Description                                                                                                                                                                                                                                                                                                                        |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Account Name</b>       | The user name that is used to authenticate the connection. This is provided by the ISP or remote system.                                                                                                                                                                                                                           |
| <b>Password</b>           | Default = Blank<br><br>Enter the password that is used to authenticate the connection. This is provided by the ISP or remote system.                                                                                                                                                                                               |
| <b>Telephone Number</b>   | Default = Blank<br><br>If the connection is to be made via ISDN enter the telephone number to be dialed. This is provided by the ISP or remote system.                                                                                                                                                                             |
| <b>Firewall Profile</b>   | Default = Internet01 if present, otherwise <None><br><br>From the list box select the Firewall Profile that is used to allow/disallow protocols through this Service.                                                                                                                                                              |
| <b>Encrypted Password</b> | Default = Off When enabled the password is authenticated via CHAP (this must also be supported at the remote end). If disabled, PAP is used as the authentication method.                                                                                                                                                          |
| <b>Default Route</b>      | Default = Off<br><br>When enabled this Service is the default route for data packets unless a blank IP Route has been defined in the system IP Routes. A green arrow appears to the left of the Service in the Configuration Tree. Only one Service can be the default route. If disabled, a route must be created under IP Route. |
| <b>Incoming Password</b>  | Default = Blank Shown on WAN and Intranet services. Enter the password that will be used to authenticate the connection from the remote Control Unit. (If this field has appeared because you have created a Service and User of the same name, this is the password you entered in the User's Password field).                    |

## Bandwidth

These options give the ability to make ISDN calls between sites only when there is data to be sent or sufficient data to warrant an additional call. The calls are made automatically without the users being aware of when calls begin or end. Using ISDN it is possible to establish a data call and be passing data in less that a second.

### **Note:**

The system will check **Minimum Call Time** first, then **Idle Period**, then the **Active Idle Period**.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                         | Description                                                                                                                                                                                        |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Minimum No of Channels</b> | Default = 1. Range = 1 to 30.<br><br>Defines the number of channels used to connect for an outgoing connection. The initial channel must be established and stable, before further calls are made. |

*Table continues...*

| Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Maximum No of Channels</b>    | <p>Default = 1. Range = 1 to 30.</p> <p>Defines the maximum number of channels to can be used. This field should contain a value equal to or greater than the Minimum Channels field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Extra BW Threshold</b>        | <p>Default = 50%. Range = 0 to 100%.</p> <p>Defines the utilization threshold at which extra channels are connected. The value entered is a %. The % utilization is calculated over the total number of channels in use at any time, which may be one, two etc.</p> <p>For example, if <b>Minimum Channels</b> set to 1, <b>Maximum Channels</b> set to 2 and <b>Extra Bandwidth</b> set to 50 - once 50% of first channel has been used the second channel is connected.</p>                                                                                                                                                                                                                                                                                                                       |
| <b>Reduce BW Threshold</b>       | <p>Default = 10%. Range = 0 to 100%.</p> <p>Defines the utilization threshold at which additional channels are disconnected. The value entered is a %. Additional calls are only dropped when the % utilization, calculated over the total number of channels in use, falls below the % value set for a time period defined by the Service-Idle Time. The last call (calls - if Minimum Calls is greater than 1) to the Service is only dropped if the % utilization falls to 0, for a time period defined by the Service-Idle Time. Only used when 2 or more channels are set above.</p> <p>For example, if Minimum Channels set to 1, Maximum Channels set to 2 and Reduce Bandwidth is set to 10 - once the usage of the 2 channels drops to 10% the number of channels used is 1.</p>           |
| <b>Callback Telephone Number</b> | <p>Default = Blank</p> <p>The number that is given to the remote service, via BAP, which the remote Control Unit then dials to allow the bandwidth to be increased. Incoming Call routing and RAS Services must be appropriately configured.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Idle Period (secs)</b>        | <p>Default = 10 seconds. Range = 0 to 999999 seconds.</p> <p>The time period, in seconds, required to expire after the line has gone idle. At this point the call is considered inactive and is completely closed.</p> <p>For example, the 'Idle Period' is set to X seconds. X seconds before the 'Active Idle Period' timeouts the Control Unit checks the packets being transmitted/received, if there is nothing then at the end of the 'Active Idle Period' the session is closed &amp; the line is dropped. If there are some packets being transmitted or received then the line stays up. After the 'Active Idle Period' has timed out the system performs the same check every X seconds, until there are no packets being transferred and the session is closed and the line dropped.</p> |

*Table continues...*

| Field                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Active Idle Period (secs):</b> | <p>Default = 180 seconds. Range = 0 to 999999 seconds.</p> <p>Sets the time period during which time the line has gone idle but there are still active sessions in progress (for example an FTP is in process, but not actually passing data at the moment). Only after this timeout will call be dropped.</p> <p>For example, you are downloading a file from your PC and for some reason the other end has stopped responding, (the remote site may have a problem etc.) the line is idle, not down, no data is being transmitted/ received but the file download session is still active. After the set time period of being in this state the line will drop and the sessions close. You may receive a remote server timeout error on your PC in the Browser/FTP client you were using.</p> |
| <b>Minimum Call Time (secs):</b>  | <p>Default = 60 seconds. Range = 0 to 999999 seconds.</p> <p>Sets the minimum time that a call is held up after initial connection. This is useful if you pay a minimum call charge every time a call is made, no matter the actual length of the call. The minimum call time should be set to match that provided by the line provider.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Extra Bandwidth Mode</b>       | <p>Default = Incoming Outgoing</p> <p>Defines the mode of operation used to increase bandwidth to the initial call to the remote Service. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Outgoing Only</b> Bandwidth is added by making outgoing calls.</li> <li>• <b>Incoming Only</b> Bandwidth is added by the remote service calling back on the BACP number (assuming that BACP is successfully negotiated).</li> <li>• <b>Outgoing Incoming</b> Uses both methods but bandwidth is first added using outgoing calls.</li> <li>• <b>Incoming Outgoing</b> Uses both methods but bandwidth is first added using incoming BACP calls.</li> </ul>                                                                                                                           |

## IP

The fields in this tab are used to configure network addressing for the services you are running. Depending on how your network is configured, the use of Network Address Translation (NAT) may be required.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field             | Description                                                                                                                                                                                                                                                                        |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IP Address</b> | <p>Default = 0.0.0.0 (address assigned by ISP)</p> <p>An address should only be entered here if a specific IP address and mask have been provided by the Service Provider. Note that if the address is in a different domain from the system then NAT is automatically enabled</p> |
| <b>IP Mask</b>    | <p>Default = 0.0.0.0 (use NAT)</p> <p>Enter the IP Mask associated with the IP Address if an address is entered.</p>                                                                                                                                                               |

*Table continues...*

| Field                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Primary Transfer IP Address</b> | <p>Default = 0.0.0.0 (No transfer)</p> <p>This address acts as a primary address for incoming IP traffic. All incoming IP packets without a session are translated to this address. This would normally be set to the local mail or web server address.</p> <p>For control units supporting a LAN1 and LAN2, the primary transfer address for each LAN can be set through the <b>System Settings &gt; System &gt; LAN1</b> and <b>System Settings &gt; System &gt; LAN2</b> tabs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>RIP Mode</b>                    | <p>Default = None</p> <p>Routing Information Protocol (RIP) is a method by which network routers can exchange information about device locations and routes. RIP can be used within small networks to allow dynamic route configuration as opposed to static configuration using. The options are:</p> <ul style="list-style-type: none"> <li>• <b>None</b> The LAN does not listen to or send RIP messages.</li> <li>• <b>Listen Only (Passive)</b> Listen to RIP-1 and RIP-2 messages in order to learn RIP routes on the network.</li> <li>• <b>RIP1</b> Listen to RIP-1 and RIP-2 messages and send RIP-1 responses as a sub-network broadcast.</li> <li>• <b>RIP2 Broadcast (RIP1 Compatibility)</b> Listen to RIP-1 and RIP-2 messages and send RIP-2 responses as a sub-network broadcast.</li> <li>• <b>RIP2 Multicast</b> Listen to RIP-1 and RIP-2 messages and send RIP-2 responses to the RIP-2 multicast address.</li> </ul> |
| <b>Request DNS</b>                 | <p>Default = Off.</p> <p>When selected, DNS information is obtained from the service provider. To use this, the DNS Server addresses set in the system configuration (System   DNS) should be blank. The PC making the DNS request should have the system set as its DNS Server. For DHCP clients the system will provide its own address as the DNS server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Forward Multicast Messages</b>  | <p>Default = On.</p> <p>By default this option is on. Multicasting allows WAN bandwidth to be maximized through the reduction of traffic that needs to be passed between sites.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Autoconnect

These settings enable you to set up automatic connections to the specified Service.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Auto Connect Interval (mins):</b> | Default = 0 (disabled). Range = 0 to 99999 minutes.<br><br>This field defines how often this Service will automatically be called ("polled"). For example setting 60 means the system will call this Service every hour in the absence of any normally generated call (this timer is reset for every call; therefore if the service is already connected, then no additional calls are made). This is ideal for SMTP Mail polling from Internet Service Providers.                                                                                                                                                                                                                                   |
| <b>Auto Connect Time Profile</b>     | Default = <None><br><br>Allows the selection of any configured Time Profiles. The selected profile controls the time period during which automatic connections to the service are made. It does NOT mean that connection to that service is barred outside of these hours. For example, if a time profile called "Working Hours" is selected, where the profile is defined to be 9:00AM to 6:00PM Monday to Friday, then automatic connection to the service will not be made unless its within the defined profile. If there is an existing connection to the service at 9:00AM, then the connection will continue. If there is no connection, then an automatic connection will be made at 9:00AM. |

## Quota

Quotas are associated with outgoing calls, they place a time limit on calls to a particular IP Service. This avoids excessive call charges when perhaps something changes on your network and call frequency increases unintentionally.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Quota Time (mins)</b> | Default = 240 minutes. Range = 0 to 99999 minutes.<br><br>Defines the number of minutes used in the quota. When the quota time is used up no further data can be passed to this service. This feature is useful to stop things like an internet game keeping a call to your ISP open for a long period.<br><br> <b>Warning:</b><br><br>Setting a value here without selecting a Quota period below will stop all further calls after the Quota Time has expired.                                                                                                                               |
| <b>Quota:</b>            | Default = Daily. Range = None, Daily, Weekly or Monthly<br><br>Sets the period during which the quota is applied. For example, if the <b>Quota Time</b> is 60 minutes and the <b>Quota</b> is set to <b>Daily</b> , then the maximum total connect time during any day is 60 minutes. Any time beyond this will cause the system to close the service and prevent any further calls to this service. To disable quotas select <b>None</b> and set a <b>Quota Time</b> of zero.<br><br> <b>Note:</b><br><br>The ClearQuota feature can be used to create short codes to refresh the quota time. |

## PPP

These settings enable you to configure Point to Point Protocol (PPP) in relation to this particular service. PPP is a protocol for communication between two computers using a Serial interface.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PPP Access Mode</b>                        | <p>Default = Digital64</p> <p>Sets the protocol, line speed and connection request type used when making outgoing calls. Incoming calls are automatically handled (see RAS services). The options are:</p> <ul style="list-style-type: none"> <li>• <b>Digital64</b> Protocol set to Sync PPP, rate 64000 bps, call presented to local exchange as a "Data Call".</li> <li>• <b>Digital56</b> As above but rate 56000 bps.</li> <li>• <b>Voice56</b> As above but call is presented to local exchange as a "Voice Call".</li> <li>• <b>V120</b> Protocol set to Async PPP, rate V.120, call presented to local exchange as a "Data Call". This mode runs at up to 64K per channel but has a higher Protocol overhead than pure 64K operation. Used for some bulletin board systems as it allows the destination end to run at a different asynchronous speed to the calling end.</li> <li>• <b>V110</b> Protocol is set to Async PPP, rate V.110. This runs at 9600 bps, call is presented to local exchange as a "Data Call". It is ideal for some bulletin boards.</li> <li>• <b>Modem</b> Allows Asynchronous PPP to run over an auto-adapting Modem to a service provider (requires a Modem2 card in the main unit)</li> </ul> |
| <b>Data Pkt. Size</b>                         | <p>Default = 0. Range = 0 to 2048.</p> <p>Sets the size limit for the Maximum Transmissible Unit.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>BACP</b>                                   | <p>Default = Off.</p> <p>Enables the negotiation and use of BACP/BCP protocols. These are used to control the addition of B channels to increase bandwidth.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Incoming traffic does not keep link up</b> | <p>Default = On.</p> <p>When enabled, the link is not kept up for incoming traffic only.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Multilink/QoS</b>                          | <p>Default = Off.</p> <p>Enables the negotiation and use of Multilink protocol (MPPC) on links into this Service. Multilink must be enabled if there is more than one channel that is allowed to be Bundled/ Multilinked to this RAS Service.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Fallback

These settings allow you to set up a fallback for the Service. For example, you may wish to connect to your ISP during working hours and at other times take advantage of varying call charges from an alternative carrier. You could therefore set up one Service to connect during peak times and another to act as fallback during the cheaper period.

You need to create an additional Service to be used during the cheaper period and select this service from the Fallback Service list box (open the Service form and select the Fallback tab).

If the original Service is to be used during specific hours and the Fallback Service to be used outside of these hours, a Time Profile can be created. Select this Time Profile from the Time Profile list box. At the set time the original Service goes into Fallback and the Fallback Service is used.

A Service can also be put into Fallback manually using short codes, for example:

**Put the service "Internet" into fallback:**

- **Short Code:** \*85
- **Telephone Number:** "Internet"
- **Line Group ID:** 0
- **Feature:** SetHuntGroupNightService

**Take the service "Internet" out of fallback:**

- **Short Code:** \*86
- **Telephone Number:** "Internet"
- **Line Group ID:** 0
- **Feature:** ClearHuntGroupNightService

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                   | Description                                                                                                                                                                                                                                             |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>In Fallback</b>      | Default = Off.<br><br>This option indicates whether the Service is in Fallback or not. A service can be set into fallback using this setting. Alternatively a service can be set into fallback using a time profile or short codes.                     |
| <b>Time profile</b>     | Default = <None> (No automatic fallback)<br><br>Select the time profile you wish to use for the service. The time profile should be set up for the hours that you wish this service to be operational, out of these hours the Fallback Service is used. |
| <b>Fallback Service</b> | Default = <None><br><br>Select the service that is used when this service is in fallback.                                                                                                                                                               |

**Dial In**

Only available for WAN and Intranet Services. This tab is used to define a WAN connection.

To define a WAN connection, click Add and enter **WAN** if the service is being routed via a WAN port on a WAN3 expansion module.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

## SSL VPN Service

Navigation: **System Settings > Services > Add/Edit Service > SSL VPN**

The SSL VPN service provides secure tunneling between the Avaya IP Office hardware installed at a customer site and a remote Avaya VPN Gateway (AVG). This secure tunnel allows support

personnel to offer remote management services to customers, such as fault management, monitoring, and administration.

For full details on how to configure and administer SSL VPN services, refer to the *Deploying Avaya IP Office™ Platform SSL VPN Services* manual.

For Server Edition, this type of configuration record can be saved as a template and new records created from a template.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                     | Description                                                                                                                                                |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Service Name</b>       | Enter a name for the SSL VPN service.                                                                                                                      |
| <b>Account Name</b>       | Enter the SSL VPN service account name. This account name is used for authenticating the SSL VPN service when connecting with the Avaya VPN Gateway (AVG). |
| <b>Account Password</b>   | Enter the password for the SSL VPN service account.                                                                                                        |
| <b>Confirm Password</b>   | Confirm the password for the SSL VPN service account.                                                                                                      |
| <b>Server Address</b>     | Enter the address of the VPN gateway. The address can be a fully qualified domain name or an IPv4 address                                                  |
| <b>Server Type</b>        | Default = AVG. This field is fixed to <b>AVG</b> (Avaya VPN Gateway).                                                                                      |
| <b>Server Port Number</b> | Default = 443. Select a port number.                                                                                                                       |

## Session

| Field                                    | Description                                                                                                                                                                                                                                                                                       |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Session Mode</b>                      | Default = Always On.<br>This setting is greyed out and cannot be adjusted.                                                                                                                                                                                                                        |
| <b>Preferred Data Transport Protocol</b> | Default = UDP.<br>This is the protocol used by the SSL VPN service for data transport. Only <b>TCP</b> is supported. If you select <b>UDP</b> as the protocol when you configure the connection, UDP displays in this field but the SSL VPN service falls back to TCP.                            |
| <b>Heartbeat Interval</b>                | Default = 30 seconds. Range = 1 to 600 seconds.<br>Enter the length of the interval between heartbeat messages, in seconds. The default value is 30 seconds.                                                                                                                                      |
| <b>Heartbeat Retries</b>                 | Default = 4. Range = 1 to 10.<br>Enter the number of unacknowledged heartbeat messages that IP Office sends to AVG before determining that AVG is not responsive. When this number of consecutive heartbeat messages is reached and AVG has not acknowledged them, IP Office ends the connection. |
| <b>Keepalive Interval</b>                | Default = 10 seconds. Range = 0 (Disabled) to 600 seconds.<br>Not used for <b>TCP</b> connections. Keepalive messages are sent over the UDP data transport channel to prevent sessions in network routers from timing out.                                                                        |

*Table continues...*

| Field                                   | Description                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reconnection Interval on Failure</b> | <p>Default = 60 seconds. Range = 1 to 600 seconds.</p> <p>The interval the system waits attempting to re-establish a connection with the AVG. The interval begins when the SSL VPN tunnel is in-service and makes an unsuccessful attempt to connect with the AVG, or when the connection with the AVG is lost. The default is 60 seconds.</p> |

## NAPT

The Network Address Port Translation (NAPT) rules are part of SSL VPN configuration. NAPT rules allow a support service provider to remotely access LAN devices located on a private IP Office network. You can configure each SSL VPN service instance with a unique set of NAPT rules. You can configure up to 64 rules.

| Field                | Description                                                                                                                                                                                                                                                                                                        |          |                                   |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|-----------------------------------|
| Application          | Default = Blank                                                                                                                                                                                                                                                                                                    |          |                                   |
|                      | Defines the communication application used to connect to the LAN device through the SSL VPN tunnel. When you select an application, the <b>Protocol</b> and <b>Port Number</b> fields are filled with the default values. The drop-down <b>Application</b> selector options and the associated default values are: |          |                                   |
|                      | Application                                                                                                                                                                                                                                                                                                        | Protocol | External and Internal Port Number |
|                      | Custom                                                                                                                                                                                                                                                                                                             | TCP      | 0                                 |
|                      | VMPro                                                                                                                                                                                                                                                                                                              | TCP      | 50791                             |

## Remote Support Services

Navigation: **System Settings > System > Services > Remote Support Services**

This type of tunnel is used by subscription mode IP Office systems for RSS connections routed to the system through COM. For details, refer to *Using Customer Operations Manager for IP Office Subscription Systems*.

### TCP Tunnels

These settings are used to configure allowed TCP tunnel connections.

| Field                     | Description                                                                                                                                                                                                                                                                                                                                           |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Application</b>        | <p>Default = Blank</p> <p>You can use the drop-down menu to select from a range of services (<b>OneXPortal</b>, <b>SSH</b>, <b>Telnet</b>, <b>RDP</b>, <b>WebControl</b>). The <b>Protocol</b> and <b>Server Port Number</b> fields are then pre-filled with the defaults for the selected application. For other services, select <b>Custom</b>.</p> |
| <b>Protocol</b>           | <p>Default = Blank</p> <p>Only <b>TCP</b> is supported.</p>                                                                                                                                                                                                                                                                                           |

# Chapter 31: Short Codes

## System Settings > Short Codes

Dialing by users on the system can be compared to short codes. When a match occurs, the matching short code sets what should happen. This may be the triggering of some feature, changing a system setting, or changing the dialed number.

For additional configuration information, see [Short Code Features](#) on page 997.

### Main content pane

The **Short Codes** main content pane lists provisioned short codes. The contents of the list depends on the filter option selected. Click the icons beside a short code to edit or delete.

**Bulk delete:** You can delete multiple records. Select the check box to the right of each record you want to delete and click **Delete**. You receive a prompt to confirm the deletion.

Click **Add/Edit Short Code** to open the Add Short Code window where you can provision a user. When you click **Add/Edit Short Code**, you are prompted to specify if the short code will be a global object or specific to a server.

## Add Short Code

Navigation: **System Settings > Short Codes > Add/Edit Short Code**

These settings are used to create System Short Codes. System short codes can be dialed by all system users. However the system short code is ignored if the user dialing matches a user or user rights short code.

### Warning:

User dialing of emergency numbers must not be blocked. If short codes are edited, the users ability to dial emergency numbers must be tested and maintained.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

- For systems using record consolidation, you can only add and edit this type of record at the solution level. The record is then automatically copied to each IP Office system in the network.

| Field                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Code</b>                     | The dialing digits used to trigger the short code. Maximum length 31 characters. For details of the characters that you can use, see <a href="#">Short Code Characters</a> on page 979.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Feature</b>                  | Select the action to be performed by the short code. For descriptions of the features, see <a href="#">Short Code Features</a> on page 997.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Telephone Number</b>         | <p>The number dialed by the short code or parameters for the short code feature. This field can contain numbers and characters. For example, it can contain Voicemail Pro start point names, user names, hunt group names and telephone numbers (including those with special characters). Maximum length 31 characters. See <a href="#">Short Code Characters</a> on page 979.</p> <p>The majority of North-American telephony services and SIP trunks use 'en-bloc' dialing. That is, they expect to receive the routing digits for a call as a single simultaneous set. Therefore, the use of a ; is recommended at the end of all dialing short codes that use an <b>N</b>. This is also recommended for all dialing where secondary dial tone short codes are being used.</p>                                                                                                                                                                                     |
| <b>Line Group ID</b>            | <p>Default = 0.</p> <p>For short codes that result in the dialing of a number, that is short codes with a <b>Dial</b> feature, this field is used to enter the initially routing destination of the call. The drop down can be used to select the following from the displayed list:</p> <ul style="list-style-type: none"> <li>• <b>Outgoing Group ID:</b> The Outgoing Group ID's current setup within the system configuration are listed. If an <b>Outgoing Group ID</b> is selected, the call will be routed to the first available line or channel within that group.</li> <li>• <b>ARS:</b> The ARS records currently configured in the system are listed. If an ARS record is selected, the call will be routed by the setting within that ARS record. Refer to ARS Overview.</li> <li>• For calls matching <b>Dial Emergency</b> short codes, this setting is overridden by the <b>Emergency ARS</b> settings of the dialing extension's location.</li> </ul> |
| <b>Locale</b>                   | <p>Default = Blank.</p> <p>For short codes that route calls to voicemail, this field can be used to set the prompts locale that should be used if available on the voicemail server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Force Account Code</b>       | <p>Default = Off.</p> <p>For short codes that result in the dialing of a number, this field trigger the user being prompted to enter a valid account code before the call is allowed to continue.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Force Authorization Code</b> | <p>Default = Off.</p> <p>This option is only shown on systems where authorization codes have been enabled. If selected, then for short codes that result in the dialing of a number, the user is required to enter a valid authorization code in order to continue the call.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

# Chapter 32: Subscription

## System Settings > Subscription

Subscriptions are monthly paid entitlements used by subscription mode systems. They can be divided into two main groups; per-user per-month user subscriptions and per-month application subscriptions. For more information, see [Subscriptions](#) on page 730.

Subscription are ordered from the Avaya Channel Marketplace, using the unique ID number of the system. Once ordered, details of the customer number and address of the subscription server are supplied in an email. Those details are then used during the initial system configuration.

| Field                 | Descriptions                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System ID</b>      | The unique number used for validation of subscriptions. <ul style="list-style-type: none"><li>• For IP500 V2 systems, this is the System SD card's PLDS ID as printed on the card. For older cards with 10-digits ID, the number is prefixed with 11.</li><li>• For other systems, the ID is a unique value based on elements of the system hardware at the time of system installation.</li></ul> |
| <b>Customer ID</b>    | This number is supplied in the email provided when the <b>System ID</b> is subscribed with Avaya.                                                                                                                                                                                                                                                                                                  |
| <b>Customer Name</b>  | The customer name used when the <b>System ID</b> was subscribed.                                                                                                                                                                                                                                                                                                                                   |
| <b>License Server</b> | This address is supplied in the email provided when the <b>System ID</b> is subscribed with Avaya.                                                                                                                                                                                                                                                                                                 |

## Available Subscriptions

The following subscriptions can be ordered for an IP Office Subscription system.

**Table 1: User Subscriptions**

| Subscription               | Description                                                                                  |
|----------------------------|----------------------------------------------------------------------------------------------|
| <b>Telephony User</b>      | Enables a user with telephony functions using a deskphone.                                   |
| <b>Telephony Plus User</b> | Enable a user with telephony functions using an deskphone and or a softphone client on a PC. |
| <b>UC User</b>             | Enable a user with the full range of telephony functions.                                    |

**Table 2: Application Subscriptions**

| Subscription                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Receptionist Console</b>        | Enables use of the IP Office SoftConsole application to answer and redirect calls. The number of subscriptions allows the matching number of users to be configured as <b>Receptionist</b> users. Those users still require a user subscriptions for their telephone connection (IP Office SoftConsole is not a softphone).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Media Manager</b>               | <p>This subscription enables support for Media Manager. This uses Voicemail Pro to perform call recording. Media Manager then collects and stores those recordings. Media Manager can be provided as a local or centralized service as follows:</p> <ul style="list-style-type: none"><li>• Run locally on the same server as the Voicemail Pro service and storing the recordings on an additional hard disk installed in that server. This option is not supported if using a Unified Communications Module.</li><li>• Run centralized and storing the recordings on the cloud-based servers providing the system's subscriptions. In this case, the number of subscriptions also controls the maximum number of recordings supported:<ol style="list-style-type: none"><li>1. 150,000</li><li>2. 300,000</li><li>3. 500,000</li><li>4. 750,000</li><li>5. 1,000,000</li></ol></li></ul> |
| <b>Third-Party CTI</b>             | This subscription enables support for CTI connections by third-party applications. This includes DevLink, DevLink3, 3rd-party TAPI and TAPI WAV.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Avaya Contact Center Select</b> | This subscription enables support the Avaya Contact Center Select (ACCS) service hosted on a separate server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Avaya Call Reporter</b>         | This subscription enables support for the Avaya Call Reporter application, hosted on a separate server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

# Chapter 33: System Directory

## System Settings > System Directory

The system directory contains records for external contacts, that is their names and numbers. These can be displayed on phones in order to make outgoing calls. They can also be used to match a name to the number on incoming calls.

For additional configuration information, see [Centralized System Directory](#) on page 738.

### Main content pane

The **System Directory** main content pane lists provisioned directory records. Click the icons beside a record to edit or delete.

Click **Add/Edit Directory Entry** to open the Add Directory window and configure a directory record.

## Add Directory Entry

Navigation: **System Settings > System Directory > Add/Edit Directory Entry**

### Additional configuration information

For additional configuration information, see [Centralized System Directory](#) on page 738.

### Configuration settings

Use these settings to create directory records that are stored in the system's configuration. Directory records can also be manually imported from a CSV file. The system can also use Directory Services to automatically import directory records from an LDAP server at regular intervals.

A system can also automatically import directory records from another system. Automatically imported records are used as part of the system directory but are not part of the editable configuration. Automatically imported records cannot override manually entered records.

For a Server Edition network, these settings can only be configured at the network level and they are stored in the configuration of the Primary Server. All other systems in the network are configured to share the directory settings of the Primary Server through their Manager settings at **System | Directory Services | HTTP**.

## Directory Special Characters

The following characters are supported in directory records. They are supported in both system configuration records and in imported records.

- **? = Any Digit** Directory records containing a ? are only used for name matching against the dialed or received digits on outgoing or incoming calls. They are excluded from the dialable directory. In the following example, any calls where the dialed or received number that starts 9732555 will have the display name Holmdel associated with them.
  - **Name:** Holmdel
  - **Number:** 9732555?
- **( ) = Optional Digits** Brackets can be used to enclose an optional portion of a number, typically the area code. Only one pair of brackets are supported in a number. Records containing digits inside ( ) brackets are only used for user dialing. The full string is dialed with the ( ) brackets removed.
- **- Characters** Directory records can also contain - characters. Records containing - characters are only used for user dialing. The full string is dialed with the - character removed.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Index</b>  | Range = 000 to 999 or None.<br><br>This value is used with system speed dials dialed from M and T-Series phones. The value can be changed but each value can only be applied to one directory record at any time. Setting the value to <b>None</b> makes the speed dial inaccessible from M and T-Series phones, however it may still be accessible from the directory functions of other phone types and applications. The Speed Dial short code feature can be used to create short codes to dial the number stored with a specific index value. |
| <b>Name</b>   | Enter the text, to be used to identify the number. Names should not begin with numbers.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Number</b> | Enter the number to be matched with the above name. The number is processed against the applicable user and system short codes. Note that if the system has been configured to use an external dialing prefix, that prefix should be added to directory numbers.                                                                                                                                                                                                                                                                                   |

### Additional configuration information

For additional information on time settings, see [System Date and Time](#) on page 787.

## Configuration settings

These settings can be edited online except **Locale** and **Favor RIP Routes over Static Routes**. Those settings must be edited offline and requires a reboot of the system. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

| Field                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>                | <p>Default = System MAC Address.</p> <p>A name to identify this system. This is typically used to identify the configuration by the location or customer's company name. Some features such as H.323 Gatekeeper require the system to have a name.</p> <ul style="list-style-type: none"> <li>• This field is case sensitive and within any network of systems must be unique.</li> <li>• Do not use &lt;, &gt;,  , \0, :, *, ?, . or /.</li> </ul>                                                                                                            |
| <b>Contact Information</b> | <p>Default = Blank.</p> <p>This field is only be edited by service user with administrator rights. If a value is entered, it sets the system under 'special control'.</p> <p>If the contact information is set using a standalone version of Manager, warnings that "This configuration is under special control" are given when the configuration is opened again. This can be used to warn other users of Manager that the system is being monitored for some specific reason and provide them with contact details of the person doing that monitoring.</p> |
| <b>Locale</b>              | <p>Sets default telephony and language settings based on the selection. It also sets various external line settings and so must be set correctly to ensure correct operation of the system. See <i>Avaya IP Office Locale Settings</i>.</p> <ul style="list-style-type: none"> <li>• For individual users, the system settings can be overridden through their own locale setting Select <b>Call Management &gt; Users &gt; Add/Edit Users &gt; User &gt; Local</b>.</li> </ul>                                                                                |
| <b>Location</b>            | <p>Default = None.</p> <p>Specify a <b>Location</b> entry for the system. This location is then used as the default <b>Location</b> settings for all the system's extensions and lines unless they are specifically configured with a different location. See <a href="#">Using Locations</a> on page 743.</p> <ul style="list-style-type: none"> <li>• When you have defined any <b>Location</b> entries, you must assign locations to each IP Office system in the network.</li> </ul>                                                                       |
| <b>IPv6</b>                | <p>Default = Disabled</p> <p>Supported on Linux-based IP Office systems only. When enabled, the IP Office system supports IPv6 features.</p>                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Device ID</b>           | <p>Server Edition only. Displays the value set for <b>Device ID</b> on the <b>System &gt; System Events &gt; Configuration</b> tab.</p> <p>If SSL VPN is configured, Avaya recommends that the <b>Device ID</b> matches an SSL VPN service Account Name. Each SSL VPN service account name has an associated SSL VPN tunnel IP address. Having the displayed Device ID match an SSL VPN service account name helps identify a particular SSL VPN tunnel IP address to use for remotely managing the IP Office.</p>                                             |

|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Phone File Server Type</b> | <p>Default = Memory Card (IP500 V2)/Disk (Linux system).</p> <p>For IP phones (H.323 and SIP) using the system as their DHCP server, the DHCP response can include the address of a file server from which the phone should request files. The setting of this field controls which address is used in the DHCP response. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Custom</b><br/>The DHCP response the system provides to phones contains the addresses set in the <b>TFTP Server IP Address</b> and <b>HTTP Server IP Address</b> fields.</li> <li>• <b>Disk: (Linux systems only)</b><br/>The system uses its hard disk for file requests from phones. The DHCP response the system provides to phones contains its the LAN address as the TFTP and HTTP file server address.</li> <li>• <b>Memory Card: (IP500 V2 only)</b><br/>The system uses its memory card for file requests from phones. The DHCP response the system provides to phones contains its the LAN address as the TFTP and HTTP file server address. This is supported for up to 50 IP phones total.</li> <li>• <b>Manager: (IP500 V2 only)</b><br/>The system forwards phone file requests to the configured <b>Manager PC IP Address</b> set below. The DHCP response the system provides to phones contains the system's LAN address as the HTTP file server address.<br/>- HTTP-TFTP Relay is supported when using IP Office Manager as the TFTP server (not supported by Linux based systems). This is done by setting the <b>TFTP Server IP Address</b> to the address of the IP Office Manager PC and the <b>HTTP Server IP Address</b> to the control unit IP address. This method is supported for up to 5 IP phones total.</li> </ul> |
| <b>HTTP Redirection</b>       | <p>Default = Off.</p> <p>Some phones allow the file server from which they request files, in this case the IP Office, to redirect the request to another file server. This is useful when the firmware files are large or to enable multiple IP Office systems to share a common firmware file server.</p> <ul style="list-style-type: none"> <li>• When enabled, for phones that support redirection, the IP Office redirects firmware file to the address set by the <b>HTTP Server IP Address</b> or <b>HTTP Server IP Address (IPv6)</b> settings. The fields are available when the <b>Phone File Server Type</b> is set to <b>Memory Card</b> or <b>Disk</b>.</li> </ul> <p>The IP Office supports HTTP redirection for the following phones:</p> <ul style="list-style-type: none"> <li>• 9600 Series and J100 Series phones.</li> <li>• B199, H175 and Vantage phone firmware requests are always redirected regardless of the <b>HTTP Redirection</b> and <b>Phone File Server Type</b> settings.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Dongle Serial Number</b>  | <p>Displayed only for pre-Release 10.0 IP500 V2 systems using ADI licensing. For system's using PLDS licensing, see the <b>PLDS Host ID (License &gt; License)</b>.</p> <p>This field is for information only. It shows the serial number of the feature key dongle against which the system last validated its licenses. <b>Local</b> is shown for a serial port, Smart Card or System SD feature key plugged directly into the control unit. <b>Remote</b> is shown for a parallel or USB feature key connected to a feature Key Server PC. The serial number is printed on the System SD card and prefixed with <b>FK</b>.</p> |
| <b>System Identification</b> | <p>Displayed for Linux based systems. This field is for information only.</p> <p>This is the unique system reference that is used to validate licenses issued for this particular system. For a physical server this is a unique value based on the server hardware. For a virtual server this value is based on several factors including the LAN1 and LAN2 IP addresses, the host name and the time zone. If any of those are changed, the System ID changes and any existing licenses become invalid.</p>                                                                                                                      |
| <b>AVPP IP Address</b>       | <p>Default = 0.0.0.0 (Disabled)</p> <p>Where Avaya 3600 Series SpectraLink wireless handsets are being used with the system, this field is used to specify the IP address of the Avaya Voice Priority Processor (AVPP)</p>                                                                                                                                                                                                                                                                                                                                                                                                        |

### Customize Locale Settings

The **Customize** locale matches the Saudi Arabia locale but with the following additional controls shown below. For other locales, these are set on .

| Field            | Description                                                                                                                                                                                                                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Tone Plan</b> | <p>Default = Tone Plan 1</p> <p>The tone plan control tones and ringing patterns. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Tone Plan 1:</b> United States.</li> <li>• <b>Tone Plan 2:</b> United Kingdom.</li> <li>• <b>Tone Plan 3:</b> France.</li> <li>• <b>Tone Plan 4:</b> Germany.</li> <li>• <b>Tone Plan 5:</b> Spain.</li> </ul> |
| <b>CLI Type</b>  | <p>Used to set the CLI detection used for incoming analog trunks. The options are: <b>DTMF</b>, <b>FSK BELL202</b>, and <b>FSK V23</b>.</p>                                                                                                                                                                                                                       |

### Time Setting Config Source = None/SNTP

These settings are shown for IP500 V2 based systems where the **Time Setting Config Source** has been set to **None** or **SNTP**. The time, date and timezone for Linux-based servers are set through the server **Platform View** menus.

- If **Location** entries have been defined, a location must be assigned to the system. The location's time settings (other than time source) override the settings below unless set to **Same as System**.

| Field                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Time Server Address</b> | <p>Default = Blank</p> <p>Displayed when the <b>Time Setting Config Source</b> is set to <b>SNTP</b>. For the SNTP servers, enter a list of IP addresses, host names, or fully-qualified domain names (FQDN). Separate each record with a space. The use of broadcast addresses is not supported.</p> <ul style="list-style-type: none"> <li>• The list is used in order of the records until a response is received.</li> <li>• In a network, other IP Office servers can use the primary IP Office as their SNTP server.</li> </ul> |
| <b>Time Zone</b>           | Select a time zone from the list. This sets the default time offset and DST to match the chosen time zone.                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Voicemail

Navigation: **System Settings > System > Voicemail**

**Additional configuration information**

For information on the **SCN Resiliency Options**, refer to *IP Office Resilience Overview*.

**Configuration settings**

The following settings are used to set the system's voicemail server type and location. Fields are enabled or grayed out as appropriate to the selected voicemail type. Refer to the appropriate voicemail installation manual for full details.

These settings can be edited online with the exception of **Voicemail Type** and **Voicemail IP Address**. These settings must be edited offline and requires a reboot of the system. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

**Voicemail Type**

| Field                     | Description                                                                                                                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Voicemail Type</b>     | Sets the type of voicemail service used by the IP Office server.                                                                                                                                                                                   |
| <b>None</b>               | No voicemail operation.                                                                                                                                                                                                                            |
| <b>Analogue Trunk MWI</b> | Select this option to support receiving a message waiting indicator (MWI) signal from analog trunks terminating on the ATM4U-V2 card. MWI is a telephone feature that turns on a visual indicator on a telephone when there are recorded messages. |

| Field                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Avaya Aura Messaging</b>  | <p>Select this option if you want to configure the system to use Avaya Aura Messaging as the central voicemail system. If you choose this option, you are still able to use Embedded Voicemail or Voicemail Pro at each branch to provide auto-attendant operation and announcements for waiting calls. When selected, access to voicemail is routed via an SM line to the numbers specified in the <b>AAM Number</b> field. The optional <b>AAM PSTN Number</b> can be configured for use when the SM Line is not in service.</p> <p>For a setup where the voicemail box numbers configured on Avaya Aura Messaging or Modular Messaging are same as the caller's DID, the short code to route the PSTN call should be such that the caller-id is withheld ( "W" in the telephone-number of the shortcode ). This is to make sure that, during rainy day - the voicemail system does not automatically go to the voicemail box of the caller based on the caller id.</p>                                                                                                                      |
| <b>Call Pilot</b>            | <p>Select this option if you want to configure the system to use CallPilot over SIP as the central voicemail system. If you choose this option, you are still able to use <b>Embedded Voicemail</b> or Voicemail Pro at each branch to provide auto-attendant operation and announcements for waiting calls. When selected, access to voicemail is routed via SM line to the numbers specified in the <b>CallPilot Number</b> field.</p> <ul style="list-style-type: none"> <li>• The <b>CallPilot PSTN Number</b> field and associated <b>Enable Voicemail Instructions Using DTMF</b> check box are not supported. IP Office cannot access the CallPilot system over the PSTN when the Session Manager line is down.</li> <li>• Users can access their CallPilot voicemail by dialing the Voicemail Collect short code. Access to CallPilot voicemail from Auto Attendant cannot be enabled by setting a Normal Transfer action to point to the Voicemail Collect short code. If desired, it can be enabled by setting a Normal Transfer action to point to the CallPilot number.</li> </ul> |
| <b>Centralized Voicemail</b> | <p>Select this option when using a Voicemail Pro system installed and licensed on another system in a multi-site network. The outgoing line group of the IP Office line connection to the system with the Voicemail Pro is entered as the <b>Voicemail Destination</b>.</p> <p>In a Server Edition network this option is used on the Secondary Server and expansion systems to indicate that they use the Primary Server for as their voicemail server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Distributed Voicemail</b> | <p>This option can be used when additional Voicemail Pro voicemail servers are installed in a SCN network and configured to exchange messages with the central voicemail server using email. This option is used if this system should use one of the additional servers for its voicemail services rather than the central server. This option is not supported by Server Edition systems.</p> <p>When selected:</p> <ul style="list-style-type: none"> <li>• The <b>Voicemail Destination</b> field is used for the outgoing H.323 IP line to the central system.</li> <li>• The <b>Voicemail IP Address</b> is used for the IP address of the distributed voicemail server the system should use.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Embedded Voicemail</b>    | <p>IP500 V2 systems can store voicemail messages and prompts on the system's own memory card. It also supports internal auto-attendant configuration. For details, refer to <i>IP Office Embedded Voicemail Installation</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Field                             | Description                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group Voicemail</b>            | This option is used to support third-party voicemail systems attached by extension ports in the group specified as the <b>Voicemail Destination</b> . Not supported by Server Edition systems.                                                                                                                                                                                                                   |
| <b>Modular Messaging over SIP</b> | <p>Select this option if you want to configure the system to use Modular Messaging over SIP as the central voicemail system.</p> <ul style="list-style-type: none"> <li>When selected, access to voicemail is routed via an SM line to the numbers specified in the <b>MM Number</b> field.</li> <li>The optional <b>MM PSTN Number</b> can be configured for use when the SM Line is not in service.</li> </ul> |
| <b>Remote Audix Voicemail</b>     | Select this option if using a remote Avaya Intuity Audix or MultiMessage voicemail system. Requires entry of an <b>Audix Voicemail</b> license. This option is not supported by Server Edition systems.                                                                                                                                                                                                          |
| <b>Voicemail Lite/Pro</b>         | Select this option when using Voicemail Pro. The IP address of the PC being used should be set as the <b>Voicemail IP Address</b> . In a Server Edition network this option is used on the Primary Server. It can also be used on the Secondary Server if the Secondary server includes its own voice mail server. Use of Voicemail Pro requires licenses for the number of simultaneous calls to be supported.  |

| Field                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Voicemail Destination</b>                | <p>Defaults: Non-Server Edition = Blank, Server Edition = IP trunk connection to the Primary Server.</p> <ul style="list-style-type: none"> <li>When the <b>Voicemail Type</b> is set to <b>Remote Audix Voicemail</b>, <b>Centralized Voicemail</b> or <b>Distributed Voicemail</b>, this setting is used to enter the outgoing line group of the line configured for connection to the phone system hosting the central voicemail server.</li> <li>When the <b>Voicemail Type</b> is set to <b>Group Voicemail</b>, this setting is used to specify the group whose user extensions are connected to the 3rd party voicemail system.</li> <li>When the <b>Voicemail Type</b> is set to <b>Analogue Trunk MWI</b>, this setting is used to specify the phone number of the message center. All analogue trunks configured for <b>Analogue Trunk MWI</b> must have the same destination.</li> </ul> |
| <b>Voicemail IP Address</b>                 | <p>Defaults: Non-Server Edition = 255.255.255.255, Primary Server = Primary Server IP Address.</p> <p>This setting is used when the <b>Voicemail Type</b> is set to <b>Voicemail Pro</b> or <b>Distributed Voicemail</b>. It is the IP address of the PC running the voicemail server that the system should use for its voicemail services.</p> <ul style="list-style-type: none"> <li>If the system is fitted with a UCM hosting Voicemail Pro, the field should be set to 169.254.0.2.</li> <li>If set as 255.255.255.255, the control unit broadcasts on the LAN for a response from a voicemail server. If set to a specific IP address, the system connects only to the voicemail server running at that address.</li> </ul>                                                                                                                                                                  |
| <b>Backup Voicemail IP Address</b>          | <p>Defaults: Primary Server = Secondary Server IP Address, All others = 0.0.0.0 (Off).</p> <p>This option is supported with Voicemail Pro. An additional voicemail server can be setup but left unused. If contact to the voicemail server specified by the <b>Voicemail IP Address</b> is lost, responsibility for voicemail services is temporarily transferred to this backup server address.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Maximum Record Time</b>                  | <p>Default = 120 seconds. Range = 30 to 180 seconds. This field is only available when <b>Embedded Voicemail</b> is selected as the <b>Voicemail Type</b>. The value sets the maximum record time for messages and prompts.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Messages Button Goes to Visual Voice</b> | <p>Default = On.</p> <p>Visual Voice allows phone users to check their voicemail mailboxes and perform action such as play, delete and forward messages through menus displayed on their phone. By default, on phones with a <b>MESSAGES</b> button, the navigation is via spoken prompts. This option allows that to be replaced by Visual Voice on phones that support Visual Voice menus. For further details see the button action.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Enable Outcalling</b>                    | <p>Default = Off (<i>Outcalling not allowed</i>).</p> <p>This setting is used to enable or disable system support for outcalling on <b>Embedded Voicemail</b> and Voicemail Pro. When not selected, all outcalling and configuration of outcalling through mailboxes is disabled. For Voicemail Pro, outcalling can also be disabled at the individual user mailbox level using the Voicemail Pro client.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Voicemail Channel Reservations

These settings allow the channels used for calls into voicemail to be reserved for particular functions. Unreserved channels can be used for any function but reserved channels cannot be used for any function other than that indicated.

| Field                            | Description                                                                                                                                                                                                                               |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Unreserved Channels</b>       | Default = All channels<br>This setting shows the number of voicemail channels, out of the total available, that have not been reserved.                                                                                                   |
| <b>Auto-Attendant</b>            | Default = 0<br>This setting sets the number of channels reserved for calls directed to one of the configured auto-attendants. .                                                                                                           |
| <b>Announcements</b>             | Default = 0<br>This setting sets the number of channels reserved for announcements. When no channels are available, calls continue without announcements.                                                                                 |
| <b>Voice Recording</b>           | Default = 0<br>This setting sets the number of channels reserved for voice recording other than mandatory voice recording (see below). If no channels are available, recording does not occur though recording progress may be indicated. |
| <b>Mailbox Access</b>            | Default = 0<br>This setting sets the number of channels reserved for users accessing mailboxes to collect messages.                                                                                                                       |
| <b>Mandatory Voice Recording</b> | Default = 0<br>This setting sets the number of channels reserved for mandatory voice recording. When no channels are available for a call set to mandatory recording, the call is barred and the caller hears busy tone.                  |

## Call Recording

These settings apply to call recording provided by Voicemail Pro.

| Field                                      | Description                                                                                                                                                                                                                                        |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Maximum Recording Retention (Days)</b>  | Default = 30 days. Range 1 to 365 days.<br>Used for subscription systems using Centralized Media Manager to store call recordings. This field sets how long recordings should be kept in the recording library before it is automatically deleted. |
| <b>Auto Restart Paused Recording (sec)</b> | Default = 15 seconds<br>The value used to set a delay after which recording is automatically resumed.                                                                                                                                              |
| <b>Hide Auto Recording</b>                 | Default = Cleared<br>In addition to the audible advice of call recording prompt, Avaya Workplace Client displays a message that states the meeting or call is being recorded.                                                                      |

*Table continues...*

| Field                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Play Advice on Call Recording</b> | <p>Default = On</p> <p>Sets whether an advice warning is played to all callers when their call is being recorded. It is a legal requirement in some countries to inform the callers before recording their calls, therefore you must get confirmation before you turn this option off.</p> <p>This option is not shown in IP Office Manager. It can be set through either IP Office Web Manager or the Voicemail Pro client.</p> |

## Speech AI

These settings are available on subscription mode systems. If enabled, the system can use text-to-speech (TTS) and automatic speech recognition (ASR) services with auto-attendants and system meet-me conferences.

| Field                   | Description                                                                                                                                                                                                                |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Google Speech AI</b> | <p>Default = Off</p> <p>If enabled, the system can use text-to-speech (TTS) and automatic speech recognition (ASR) services with auto-attendants and system meet-me conferences.</p>                                       |
| <b>Speech Language</b>  | <p>Default = Match the system locale language if possible.</p> <p>Sets the default language used for TTS prompts. This can be overridden by the particular setting of the auto-attendant or system meet-me conference.</p> |
| <b>Speech Voice</b>     | <p>Sets the voice to be used with the speech language. The number of voices available varies depending on the speech language selected.</p>                                                                                |

## DTMF Breakout

Allows system defaults to be set. These are then applied to all user mailboxes unless the user's own settings differ.

The Park & Page feature is supported when the system voicemail type is configured as **Embedded Voicemail** or **Voicemail Pro**. It allows a call to be parked while a page is made to a hunt group or extension. This feature can be configured for Breakout DTMF 0, Breakout DTMF 2, or Breakout DTMF 3.

Park & Page is also supported on systems where Avaya Aura Messaging, Modular Messaging over SIP, or CallPilot (for IP Office Aura Edition with CS 1000 deployments) is configured as the central voice mail system and the local Embedded Voicemail or Voicemail Pro provides auto attendant operation.

| Field                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reception/<br/>Breakout (DTMF 0)</b> | <p>The number to which a caller is transferred if they press 0 while listening to the mailbox greeting rather than leaving a message (*0 on Embedded Voicemail in IP Office Mode).</p> <p>For voicemail systems set to Intuity emulation mode, the mailbox owner can also access this option when collecting their messages by dialing *0.</p> <p>If the mailbox has been reached through a Voicemail Pro call flow containing a <b>Leave Mail</b> action, the option provided when 0 is pressed are:</p> <ul style="list-style-type: none"> <li>• For IP Office mode, the call follows the <b>Leave Mail</b> action's <b>Failure</b> or <b>Success</b> results connections depending on whether the caller pressed 0 before or after the record tone.</li> <li>• For Intuity mode, pressing 0 always follows the <b>Reception/Breakout (DTMF 0)</b> setting.</li> <li>• When Park &amp; Page is selected for a DTFM breakout, the following drop-down boxes appear: <ul style="list-style-type: none"> <li>- <b>Paging Number:</b> Displays a list of hunt groups and users (extensions). Select a hunt group or extension to configure this option.</li> <li>- <b>Retries:</b> The range is 0 to 5. The default setting is 0.</li> <li>- <b>Retry Timeout:</b> Provided in the format M:SS (minute:seconds). The range can be set in 15-second increments. The minimum setting is 15 seconds and the maximum setting is 5 minutes. The default setting is 15 seconds</li> </ul> </li> </ul> |
| <b>Breakout (DTMF 2)</b>                | The number to which a caller is transferred if they press 2 while listening to the mailbox greeting rather than leaving a message (*2 on Embedded Voicemail in IP Office Mode).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Breakout (DTMF 3)</b>                | The number to which a caller is transferred if they press 3 while listening to the mailbox greeting rather than leaving a message (*3 on Embedded Voicemail in IP Office Mode).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### Voicemail Code Complexity

Defines the requirements for the voicemail code.

For IP Office systems that have **Voicemail Type** set to **Centralized**, the **Voicemail Code Complexity** settings must be the same as the IP Office system that is connected to Voicemail Pro.

| Field                 | Description                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enforcement</b>    | <p>Default = On.</p> <p>When on, a user PIN is required. The enforcement is not forced during upgrade but after checking, it can not be cleared.</p> |
| <b>Minimum Length</b> | Default = 6. Maximum 31 digits. Older configurations can continue to have 4 digits with a maximum of 20 digits.                                      |

|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Complexity</b> | <p>Default = On.</p> <p>When on, the following complexity rules are enforced.</p> <ul style="list-style-type: none"> <li>• The user extension number cannot be used.</li> <li>• A PIN consisting of repeated digits is not allowed (111111).</li> <li>• A PIN consisting of a sequence, forward or reverse, is not allowed (123456, 564321).</li> </ul> <p>The number of users having invalid Voicemail Code complexity is highlighted below this field in red colored text.</p> |

## SIP Settings

For Embedded Voicemail and Voicemail Pro, for calls made or received on a SIP line where any of the line's SIP URI fields are set to **Use Internal Data**, that data is taken from these settings. These options are shown if the system has SIP trunks and is set to use **Embedded Voicemail**, **Voicemail Lite/Pro**, **Centralized Voicemail** or **Distributed Voicemail**.

| Field                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SIP Name</b>                 | <p>Default = Blank on Voicemail tab/Extension number on other tabs.</p> <p>This value is used for fields, other the <code>Contact</code> header, where the SIP URI entry being used has its <b>Contact</b> field set to <b>Use Internal Data</b>.</p> <ul style="list-style-type: none"> <li>• On incoming calls, if the <b>Local URI</b> is set to <b>Use Internal Data</b>, the system can potentially match the received <code>R-URI</code> or <code>From</code> header value to a user and/or group <b>SIP Name</b>. This requires the SIP URIs <b>Incoming Group</b> to match a Incoming Call Route with the same <b>Line Group ID</b> and a . (period) destination.</li> </ul> |
| <b>SIP Display Name (Alias)</b> | <p>Default = Blank on Voicemail tab/Name on other tabs.</p> <p>The value from this field is used when the <b>Display</b> field of the SIP URI being used is set to <b>Use Internal Data</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Contact</b>                  | <p>Default = Blank on Voicemail tab/Extension number on other tabs.</p> <p>The value is used for the <code>Contact</code> header when the <b>Contact</b> field of the SIP URI being used for a SIP call is set to <b>Use Internal Data</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Anonymous</b>                | <p>Default = On on Voicemail tab/Off on other tabs.</p> <p>If the <code>From</code> field in the SIP URI is set to <b>Use Internal Data</b>, selecting this option inserts <code>Anonymous</code> into that field rather than the <b>SIP Name</b> set above. See <a href="#">Anonymous SIP Calls</a> on page 939.</p>                                                                                                                                                                                                                                                                                                                                                                |

## Voicemail Language Prompts

When the system routes a call to the voicemail server it indicates the locale for which matching prompts should be provided if available. The locale sent to the voicemail server by the system is determined as show below. If the required set of prompts is not available, the voicemail will fallback to another appropriate language and finally to English (refer to the appropriate voicemail installation manual for details).

- **Short Code Locale:** The short code locale, if set, is used if the call is routed to voicemail using the short code.

- **Incoming Call Route Locale:** The incoming call route locale, if set, is used if caller is external.
- **User Locale:** The user locale, if set, is used if the caller is internal.
- **System Locale:** If no user or incoming call route locale is set, the system locale is used unless overridden by a short code locale.

Systems using Embedded Voicemail, if the required set of upgraded language prompts to match the locale is not present on the system SD card, Manager will display an error. The required prompt set can be uploaded from Manager using the **Add/Display VM Locales** option.

## System Events

Navigation: **System Settings > System > System Events**

The system supports a number of methods by which events occurring on the system can be reported. These are in addition to the real-time and historical reports available through the System Status Application (SSA).

## SNMP Settings

Navigation: **System Settings > System-SNMP > SNMP Settings**

This form is used for general configuration related to system alarms.

Note that the QoS Parameters are only available in Manager.

### Configuration Settings

These settings can only be edited offline. Changes to these settings require a reboot of the system. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

If an SSL VPN is configured, Avaya recommends that the Device ID match an SSL VPN service Account Name. Each SSL VPN service account name has an associated SSL VPN tunnel IP address. Having the displayed Device ID match an SSL VPN service account name helps identify a particular SSL VPN tunnel IP address to use for remotely managing IP Office. |              |              |              |                  |         |         |        |        |        |             |      |      |

| <b>QoS Parameters</b><br><br>These parameters are used if the setting <b>System Settings &gt; System &gt; System Events &gt; Enable RTCP Monitor on Port 5005</b> is set to On. They are used as alarm thresholds for the QoS data collected by the system for calls made by Avaya H.323 phones and for phones using VCM channels. If a monitored call exceeds any of the threshold an alarm is sent to the System Status application. Quality of Service alarms can also be sent from the system using Alarms.<br><br><ul style="list-style-type: none"><li>• The alarm occurs at the end of a call. If a call is held or parked and then retrieved, an alarm can occur for each segment of the call that exceeded a threshold.</li><li>• Where a call is between two extensions on the system, it is possible that both extensions will generate an alarm for the call.</li><li>• An alarm will not be triggered for the QoS parameters recorded during the first 5 seconds of a call.</li></ul> |                                                                                                                                                                                                                                                                                                                                                                                                                              |              |              |              |                  |         |         |        |        |        |             |      |      |

## Add SNMP Trap

Navigation: **System Settings > System-SNMP > Add/Edit SNMP Trap**

### Offline Editing

These settings must be edited offline.

To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

This form is used to configure what can cause alarms to be sent using the different alarm methods.

- Up to 5 alarm traps can be configured for use with the SNMP settings on the **System | System Events | Configuration** tab.
- Up to 3 email alarms can be configured for sending using the systems **System | SMTP** settings. The email destination is set as part of the alarm configuration below.
- Up to 2 alarms can be configured for sending to a Syslog destination that is included in the alarm settings.

### Configuration Settings

These settings can only be edited offline. Changes to these settings require a reboot of the system. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

## Alarm Types

Note the following.

- **Voicemail Pro Storage Alarms:** The alarm threshold is adjustable through the Voicemail Pro client.
- **Embedded Voicemail Storage Alarms:** A disk full alarm is generated when the Embedded Voicemail memory card reaches 90% full. In addition a critical space alarm is generated at 99% full and an OK alarm is generated when the disk space returns to below 90% full.
- **Loopback:** This type of alarm is only available for systems with a United States locale.

The list of IP Office alarms is available on the Admin CD in the folder \snmp\_mibs\IPOffice.

# SMTP

Navigation: **System Settings > System > SMTP**

## Offline Editing

These settings must be edited offline.

To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

## Configuration Settings

SMTP can be used as the method of sending system alarms. The email destination is set as part of the email alarms configured in **System Settings > System > System Events**.

SMTP can be used with Embedded Voicemail for Voicemail Email. The voicemail destination is set by the user's Voicemail Email address.

| Field                                 | Description                                                                                                                                                                                                                                                        |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Server Address</b>                 | Default = Blank<br><br>This field sets the IP address of the SMTP server being used to forward SNMP alarms sent by email.                                                                                                                                          |

## DNS

Navigation: **System Settings > System > DNS**

These settings configure the DNS servers to which the IP Office system should send DNS request when it needs to resolve name addresses into numeric IP addresses.

- DNS is a mechanism through which the URL's such as `www.avaya.com` are resolved into IP addresses. Typically the customer's internet service provider (ISP) specifies the address of the DNS server their customers should use. In more complex networks, the customer may host their own DNS server.
- WINS (Windows Internet Name Service) is a mechanism used within a Windows network to convert PC and server names to IP addresses using a WINS server.

If the IP Office system is acting as a DHCP server, in addition to providing clients with their IP address settings, it can also provide them with their DNS and WINS settings if requested by the client.

These settings must be edited offline. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

## LAN1

Navigation: **System Settings > System > LAN1**

Used to configure the behavior of the services provided by the system's first LAN interface.

Up to 2 LAN's (LAN1 and LAN2) can be configured. The control unit has 2 RJ45 Ethernet ports, marked as LAN and WAN. These form a full-duplex managed layer-3 switch. Within the system configuration, the physical LAN port is LAN1, the physical WAN port is LAN2.

Configuring both interfaces with the same IP address on the same subnet is not supported. However, no warning is issued when this configuration is implemented.

## DHCP Pools

You can use DHCP pools to configure multiple sets of IPv4 addresses that the IP Office can allocate when configured as a DHCP server.

- IP Office Web Manager displays these settings when you have enabled **Advanced** above.
- On an IP500 V2 system, you can configure up to 8 pools.
- On Linux-based IP Office systems, you can configure up to 64 pools.
- The IP Office uses the **IP Address**, **IP Mask** and **Number of DHCP IP Addresses** settings set on the **LAN Settings** tab for the first pool.

When these actions are performed:

- For E129 and B179 SIP phone models, the IP Office triggers a reboot of the phones to renew their IP address lease and apply the new address settings.
- For the remaining DHCP clients, you must manually reboot the devices to force an IP addresses lease renewal. Otherwise, the devices continue to use the allocated IP addresses until the IP addresses lease time out expires. IP address lease time out is set to three days.

| Field                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |                      |                                                                      |                    |                                                                                                |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                  |                                                                                        |

## Settings (IPv6)

Navigation: **System Settings > System > LAN1 > Settings (IPv6)**

You can use these settings to configure IPv6 address support on the LAN.

- The IP Office licensing and configuration requirements for remote extensions are the same for IPv6 as for IPv4. The IP Office treats any extension using an IPv6 global unicast address not issued by IP Office DHCP as a remote extension.

## Configuration Settings

You must edit these settings offline. Select **Menu Bar Current User Icon > Offline Mode**.

## DHCP Pools (IPv6)

You can use DHCP pools to configure multiple sets of IPv4 addresses that the IP Office can allocate when configured as a stateful DHCPv6 server.

- IP Office Web Manager displays these settings when you have enabled **Advanced** above.
- Supported on Linux-based IP Office R12.1 systems only. To enable IPv6 support, select **LAN1 > LAN Setting (IPv6) > IPv6** and/or **LAN2 > LAN Setting (IPv6) > IPv6**.
- You can configure up to 64 pools.
- The IP Office uses the **IP Address** and **Number of DHCP IP Addresses** settings set on the **LAN Setting (IPv6)** tab for the first pool.

| Field                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |         |             |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                  |                                                                                                          |

**Additional configuration information**

For more information on remote H.323 extensions, see “Configuring Remote H.323 Extensions” in the chapter **Configure general system settings** in *Administering Avaya IP Office™ Platform with Web Manager*.

**Configuration settings**

Used to set the system defaults for VoIP operation on the LAN interface.

The following settings can be edited online.

- |                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                           |

|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>H.323 Signaling over TLS</b> | <p>Default = Disabled. For hosted deployments, default = Preferred.</p> <p>When enabled, TLS is used to secure the registration and call signaling communication between IP Office and endpoints that support TLS. The H.323 phones that support TLS are 9608, 9611, 9621, and 9641 running firmware version 6.6 or higher.</p> <p>When enabled, certificate information is configured in the <code>46xxSettings.txt</code> file on IP Office and automatically downloaded to the phone. When IP Office receives a request from the phone for an identity certificate, IP Office searches its trusted certificate store and finds the root CA that issued its identity certificate. IP Office then provides the root CA as an auto-generated certificate file named <code>Root-CA-xxxxxxx.pem</code>.</p> <p>For information on IP Office certificates, see <b>Security &gt; Certificates</b>.</p> <p>The options are:</p> <ul style="list-style-type: none"> <li>• <b>Disabled:</b> TLS is not used.</li> <li>• <b>Preferred:</b> Use TLS when connecting to a phone that supports TLS.</li> <li>• <b>Enforced:</b> TLS must be used. If the phone does not support TLS, the connection is rejected.</li> </ul> <p>When set to <b>Enforced</b>, the <b>Remote Call Signaling Port</b> setting is disabled.</p> <p>If TLS security is enabled (<b>Enforced</b> or <b>Preferred</b>), it is recommended that you enable a matching level of media security on <b>System Settings &gt; System &gt; VoIP Security</b>.</p> |
| <b>H.323 Remote Extn Enable</b> | <p>Default = Off.</p> <p>The system can be configured to support remote H.323 extensions in the case where NAT is used in the connection path. This could be the case where the IP Office is located behind a corporate NAT/Firewall router and/or the H.323 phone is located behind residential NAT enable router.</p> <p>The use of this option and the interaction and configuration of external third party elements is beyond the scope this help file.</p> <p>In the case where the public IP address of the corporate router is unknown, the LAN's Network Topology settings should be used to configure a STUN Server. Enabling <b>H.323 Remote Extn Enable</b> allows configuration of the <b>RTP Port number Range (NAT)</b> settings.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Field                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Auto-create Extn</b> | <p>Default = Off</p> <p>The field to set up auto creation of extensions for H.323 phones registering themselves with the System as their gatekeeper. If selected, the system displays the <b>Auto Create Extension Password</b> window prompting you to type a Password and Confirm Password. This password is used for subsequent auto creation of extensions. A message <code>H.323 Auto-Create Extension option is active</code> is flashed next to the <b>Auto Create Extension</b> field till the option is cleared. SIP Extensions use a separate setting, see below. This setting is not supported on systems configured to use WebLM server licensing.</p> <p>If using resilience backup to support Avaya IP phones, <b>Auto-create Extn</b> and <b>Auto-create User</b> should not be left enabled after initial configuration or any subsequent addition of new extensions and users. Leaving auto-create options enabled on a system that is a failover target may cause duplicate extension/user records on the multi-site network under multiple failure scenarios.</p> <p>For security, any auto-create settings that are enabled are automatically disabled after 24 hours.</p> |

### SIP Trunks Enable

| Field                    | Description                                                                                                                                                                                                                                              |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SIP Trunks Enable</b> | <p>Default = On.</p> <p>This settings enables support of SIP trunks. It also requires entry of <b>SIP Trunk Channels</b> licenses.</p> <p>Enabling <b>SIP Trunks Enable</b> allows configuration of the <b>RTP Port number Range (NAT)</b> settings.</p> |

### SIP Registrar Enable

| Field                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SIP Registrar Enable</b> | <p>Default = Off.</p> <p>If enabled, the IP Office can act as a SIP Registrar to which SIP endpoints register.</p> <ul style="list-style-type: none"> <li>• Separate SIP registrars can be configured on LAN1 and LAN2.</li> <li>• Registration of a SIP endpoint requires an available <b>IP Endpoints</b> license.</li> <li>• SIP endpoints are also still subject to the extension capacity limits of the system.</li> </ul> |

|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SIP Domain Name</b>              | <p>Default = Blank</p> <p>This value is used by SIP endpoints for registration with the IP Office system. SIP endpoints register with IP Office using their SIP address that consists of their phone number and IP Office SIP domain. Since IP Office does not allow calls from unauthorized entities, the SIP domain does not need to be resolvable. However, the SIP domain should be associated with FQDN (Fully Qualified Domain Name) for security purposes. The entry should match the domain suffix part of the SIP Registrar FQDN below, for example, <code>example.com</code>. If the field is left blank, registration uses the LAN 1, LAN2, or public IP address.</p> <p> <b>Note:</b></p> <p>For Avaya SIP telephones supported for resilience, the <b>SIP Domain Name</b> must be common to all systems providing resilience.</p> |
| <b>SIP Registrar FQDN</b>           | <p>Default = Blank</p> <p>The fully-qualified domain name to which the SIP endpoint send their registration requests. For example, <code>sbc.example.com</code>.</p> <ul style="list-style-type: none"> <li>• This FQDN is also used for <b>Avaya Cloud Services</b> and <b>Avaya Push Notification Services</b></li> </ul> <p>The customer DNS must resolve this FQDN to an IP address that routes to the IP Office. That is:</p> <ul style="list-style-type: none"> <li>• For local extensions, the IP address of the IP Office LAN.</li> <li>• For remote extensions, the external IPv4 address of the Avaya SBC or customer firewall that routes to the IP Office.</li> </ul>                                                                                                                                                                                                                                               |
| <b>Challenge Expiry Time (secs)</b> | <p>Default = 10.</p> <p>The challenge expiry time is used during SIP extension registration. When a device registers, the IP Office SIP Registrar sends a challenges and waits for a response. If a response is not received within this timeout, the registration fails.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Layer 4 Protocol</b>             | <p>Default = TCP 5060 + UDP 5060.</p> <p>Sets the ports on which the IP Office listens for SIP extension connections. |-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Port Number Range</b>    | <p>For each VoIP call, a receive port for incoming Real Time Protocol (RTP) traffic is selected from a defined range of possible ports, using the even numbers in that range. The Real Time Control Protocol (RTCP) traffic for the same call uses the RTP port number plus 1, that is the odd numbers.</p> <p>On some installations, it may be a requirement to change or restrict the port range used. It is recommended that only port numbers between 49152 and 65535 are used, that being the range defined by the Internet Assigned Numbers Authority (IANA) for dynamic usage.</p> <p> <b>Important:</b></p> <p>The minimum and maximum settings of the port range should only be adjusted after careful consideration of the customer network configuration and existing port usage. The gap between the minimum and maximum port values must be at least 254.</p> |
| <b>Port Range (minimum)</b> | <p>Default: IP500 V2 = 46750/Linux = 40750. Range = 1024 to 65530.</p> <p>This sets the lower limit for the RTP port numbers used by the system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Port Range (maximum)</b> | <p>Default = 50750. Range = 1024 to 65530.</p> <p>This sets the upper limit for the RTP port numbers used by the system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Port Number Range (NAT)

These settings are available when either **H.323 Remote Extn Enable**, **SIP Trunks Enable**, or **SIP Remote Extn Enable** is set to On.

This option is not supported if **System Settings > System > LAN1 > Network Topology** is set to **Symmetric Firewall** or **Open Internet**.

|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enable RTCP Monitor On Port 5005</b>     | <p>Default = On.</p> <p>For 1600, 4600, 5600, 9600 and J100 Series phones, the system can collect VoIP QoS (Quality of Service) data from the phones. For other phones, including non-IP phones, it can collect QoS data for calls that use a VCM channel. The QoS data collected by the system is displayed by the System Status Application.</p> <ul style="list-style-type: none"> <li>• This setting is mergeable. However, it is only applied to IP phones when they register with the system. Therefore, any change to this setting requires the IP phones that have already registered to be rebooted. IP phones can be remotely rebooted using the System Status Application.</li> <li>• The QoS data collected includes: RTP IP Address, Codec, Connection Type, Round Trip Delay, Receive Jitter, Receive Packet Loss.</li> <li>• This setting is not the same as the RTCPMON option within Avaya H.323 phone settings. The system does not support the RTCPMON option.</li> </ul> |
| <b>RTCP collector IP address for phones</b> | <p>Default = Blank.</p> <p>Sets the destination for the RTCP Monitor data described above. This enables you to send the data collected to a third party QoS monitoring application.</p> <p>The <b>Enable RTCP Monitor On Port 5005</b> must be turned Off to enable this field. Changes to this setting requires a reboot of the phones.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Keepalives

These settings are used to keep open external connections through devices such as firewalls and session-border controllers. You can use these settings when the IP Office has connections to SIP trunks and/or H323 and SIP remote workers.

| Field                     | Description                                                                                                                                                                       |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Scope</b>              | <p>Default = Disabled</p> <p>Select whether the sending of keepalive packets should be disabled or sent for RTP or for both RTP and RTCP.</p>                                     |
| <b>Periodic timeout</b>   | <p>Default = 0 (Off). Range = 0 to 180 seconds.</p> <p>Sets how long the system will wait before sending a keepalive if no other packets of the select <b>SCOPE</b> are seen.</p> |
| <b>Initial keepalives</b> | <p>Default = Disabled.</p> <p>If enabled, keepalives can also be sent during the initial connection setup.</p>                                                                    |

## DiffServ Settings

When transporting VoIP over low speed links, data packets (1500 byte packets) can block or delay voice packets (typically 67 or 31 bytes). This can cause poor speech quality. Therefore, all traffic routers in a network should support Quality of Service (QoS).

The IP Office system supports the DiffServ (RFC2474) QoS mechanism. This uses a Type of Service (ToS) field in the IP packet header.

The IP Office applies the LANs DiffServ settings to outgoing traffic on any SIP lines which have **System Settings > Line > Add/Edit Trunk Line > SIP Line > SIP Transport > Use Network Topology Info** set to match the LAN interface.

- The hex and decimal entry fields for the following values are linked. The hex value is equal to the decimal multiplied by 4.
- Do not use the same values for call signaling and call media (audio and voice).
- For correct operation, the same value must be set at both ends.

| Field                   | Description                                                                                                                                                                                                                                                 |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Navigation: **System Settings > System > LAN1 > Network Topology**

These settings are used for support of external SIP trunks when not using an SBC. They are also used for supporting remote SIP/H323 extensions.

**Network Address Translation (NAT) Overview**

The network address translation (NAT) done by firewalls can affect VoIP calls. Two methods that can be used to overcome this are STUN or TURN.

| NAT Method  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>STUN</b> | <p>STUN ("<i>Session Traversal for NAT</i>") is a mechanism to overcome the effect of some NAT firewalls. In summary:</p> <ul style="list-style-type: none"> <li>• The device configured for STUN sends test packets to the STUN server address. These go through the firewall NAT process.</li> <li>• The STUN server replies, including in the reply copies of the original packets it received.</li> <li>• By comparing the packets sent and received, the sender can try to determine the type of NAT applied. It can then modify future packets it sends to other destinations to overcome the effects of the firewall NAT.</li> </ul> |
| <b>TURN</b> | <p>TURN ("<i>Traversal Using Relays around NAT</i>") is a NAT traversal mechanism that works by relaying all traffic via a TURN server. This is typically a TURN service provided by the customer's SBC.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                |

STUN allows direct connection between the sender and receiver once setup, but is more restricted in the types of NAT with which it can work. TURN supports more types of NAT, but also needs to relay all traffic between the sender and receiver via the TURN server. STUN is easier to implement and maintain compared to TURN, however most SBC devices support TURN.

**Configuration Settings**

These settings must be edited offline. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

**General**

These settings are used by the IP Office for connection to a STUN server to support SIP trunks.

| Field                        | Description                                                                                                                                                                                                                                                                                                                          |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IP Office STUN Server</b> | <p>Default = Blank</p> <p>The IP address or fully qualified domain name (FQDN) of the STUN server the IP Office should use. The system will send basic SIP messages to this destination and from data inserted into the replies can try to determine the type NAT changes being applied by any firewall between it and the ITSP.</p> |

|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Port</b>                | Default = 3478.<br>Sets the port to which the STUN requests are sent.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Run STUN</b>            | This button tests STUN operation between the system LAN using the settings above. The results are used to automatically fill the <b>NAT</b> fields with appropriate values discovered by the system. A  information icon is then shown against the fields to indicate that the values were automatically discovered rather than manually entered.<br><br>Before using <b>Run STUN</b> , the SIP trunk must be configured. |
| <b>Run STUN on startup</b> | Default = Off<br><br>This option is used in conjunction with values automatically discovered using <b>Run STUN</b> . When selected, the system reruns STUN discovery whenever the system is rebooted or connection failure to the SIP server occurs.                                                                                                                                                                                                                                                       |

## WebRTC

These settings are used for remote User Portal users using WebRTC (**Softphone** mode) to make and receive calls using STUN and/or TURN. The values set are provided to the remote user portal sessions through their normal MTCTI connection.

| Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>WebRTC Client STUN Server</b> | Default = Blank (use <code>stun.freeswitch.org:3478</code> )<br>Set the IP address or FQDN of the STUN server that the clients should use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Port</b>                      | Default = 3748<br>The port the clients should use for STUN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>WebRTC Client Turn Server</b> | Default = Blank<br><br>This is used for solutions that use a TURN service configured on an SBC. It provides the IP address or FQDN of the TURN service.<br><br><ul style="list-style-type: none"> <li>You can add the required port by adding <code>:&lt;port number&gt;</code>. For example add <code>:3748</code> to the address or FQDN.</li> <li>You can set the required transport method by adding <code>?transport=udp</code> or <code>?transport=tcp</code> to the address or FQDN. By default UDP is assumed.</li> <li>The TURN server connection uses the name and password of an IP Office service user. <ul style="list-style-type: none"> <li>The service user must be a member of the security rights group <b>TURN Server</b> with <b>TURN Server Connection</b> enabled.</li> <li>On new and defaulted systems, a service user called <b>TURNServer</b> exists and is a member of the <b>TURN Server</b> rights group. However the service user is disabled by default.</li> </ul> </li> <li>The details of the TURN server address, name and password are passed to IP Office User Portal sessions using their MTCTI connection to the IP Office.</li> </ul> |

## NAT

The following fields can be completed either manually or the system can attempt to automatically discover the appropriate values using **Run STUN**.

To complete the fields automatically:

1. Check that the SIP trunk to the ITSP is configured.
2. Set the **IP Office STUN Server** address.
3. Test STUN by clicking **Run STUN**.
4. Close and reload the configuration. If STUN was successful, the remaining fields are updated using the results. A  icon is shown against the fields to indicate that the values were automatically discovered rather than manually entered.

| Field                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Firewall/NAT Type</b>              | Default = Unknown<br><br>The settings here reflect different types of network firewalls. For descriptions of the various options, see the table below.                                                                                                                                                                                                                                                                     |
| <b>Binding Refresh Time (seconds)</b> | Default = 0 (Never). Range = 0 to 3600 seconds.<br><br>To keep the firewall port open for incoming calls, the system can send recurring <b>SIP OPTIONS</b> requests to the remote proxy terminating the trunk. This setting configures the frequency of those requests.<br><br>If you do not set a binding refresh time, you may experience problems receiving inbound SIP calls after a short period of normal operation. |
| <b>Public IP Address (IPv4)</b>       | Default = 0.0.0.0<br><br>If no address is set, the system's <b>LAN1</b> address is used.                                                                                                                                                                                                                                                                                                                                   |

| Firewall/NAT Type               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Open Internet</b>            | If this mode is selected, the IP Office ignores settings obtained by STUN lookups. The IP address used is that of the IP Office system's LAN interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>One-To-One NAT</b>           | <p>This setting supports deployments where the IP Office is behind a NAT that performs IP address translation but not port mappings. All required ports must be open on the NAT.</p> <p>When set to <b>One-To-One NAT</b>, the following configuration settings are applied and cannot be edited.</p> <ul style="list-style-type: none"> <li>• The <b>NAT &gt; SIP Registrar public ports</b> values are set to 0.</li> <li>• The <b>LAN1 &gt; VoIP &gt; SIP Registrar Enable</b> remote protocol port values are set to equal their corresponding local protocol port values.</li> <li>• The <b>LAN1 &gt; VoIP &gt; RTP &gt; Port Number Range (NAT) RTP   Port Number Range (NAT)</b> values are set to equal the corresponding <b>Port Number Range</b> values.</li> </ul>                                                                                                                  |
| <b>Port Restricted Cone NAT</b> | <p>Similar to a <b>Restricted Cone NAT</b>, but the restriction includes port numbers. Specifically, an external host can send a packet, with source IP address X and source port P, to the internal host only if the internal host had previously sent a packet to IP address X and port P. SIP packets needs to be mapped. Keep-alives must be sent to all ports that will be the source of a packet for each ITSP host IP address. If this type of NAT/Firewall is detected or manually selected, no warning will be displayed for this type of NAT.</p> <p>Some Port Restricted NAT's have been found to be more symmetric in behavior, creating a separate binding for each opened Port, if this is the case the manager will display a warning 'Communication is not possible unless the STUN server is supported on same IP address as the ITSP' as part of the manager validation.</p> |
| <b>Restricted Cone NAT</b>      | A restricted cone NAT is one where all requests from the same internal IP address and port are mapped to the same external IP address and port. Unlike a full cone NAT, an external host (with IP address X) can send a packet to the internal host only if the internal host had previously sent a packet to IP address X. SIP packets needs to be mapped. Responses from hosts are restricted to those that a packet has been sent to. So if multiple ITSP hosts are to be supported, a keep alive will need to be sent to each host. If this type of NAT/Firewall is detected or manually selected, no warning will be displayed for this type of NAT.                                                                                                                                                                                                                                      |
| <b>Static Port Block</b>        | Use the RTP Port Number Range specified on the VoIP tab without STUN translation. Those ports must be fixed as open on any NAT firewall involved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Symmetric Firewall</b>       | <p>SIP packets are unchanged but ports need to be opened and kept open with keep-alives.</p> <ul style="list-style-type: none"> <li>• If this type of NAT is detected or manually selected, a warning 'Communication is not possible unless the STUN server is supported on same IP address as the ITSP' is displayed as part of the manager validation.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Firewall/NAT Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Symmetric NAT</b> | <p>A symmetric NAT is one where all requests from the same internal IP address and port, to a specific destination IP address and port, are mapped to the same external IP address and port. If the same host sends a packet with the same source address and port, but to a different destination, a different mapping is used. Furthermore, only the external host that receives a packet can send a UDP packet back to the internal host. SIP Packets need to be mapped but STUN will not provide the correct information unless the IP address on the STUN server is the same as the ITSP Host.</p> <ul style="list-style-type: none"> <li>• If this type of NAT is detected or manually selected, a warning 'Communication is not possible unless the STUN server is supported on same IP address as the ITSP' is displayed as part of the manager validation.</li> </ul> |
| <b>Unknown</b>       | The type of NAT is unknown or could not be determined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## SBC

These settings are used to provide values to remote extensions that connect to the IP Office through an ASBCE. The values set are passed to the phones using methods that vary depending on the phone type. For example, by altering the values in the auto-generated `46xxsettings.txt` file when requested by a remote phone.

These settings replace the **RW\_SB... NoUser** source numbers used in pre-R11.1.2.4 systems, which should be removed once replaced with these values.

| Field                           | Description                                                                                                                                                                                                                                     |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Public IP Address (IPv4)</b> | <p>Default = Blank</p> <p>The public IPv4 address that routes to the public/external side of the ASBCE. Depending on the customer network, this can be the public IP address of another device such as a firewall that forwards to the SBC.</p> |

## LAN2

Navigation: **System Settings > System > LAN2**

These settings used to configure the system's second LAN interface.

These settings can only be edited offline. Changes to these settings require a reboot of the system. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

The fields available for LAN2 are the same as for LAN1 except for the following:

- Avaya supports IPv6 on IP Office LAN1. Avaya also supports IPv6 on LAN2 but only when IPv6 is enabled on LAN1 also.

| Field    | Description                                                                                                                                      |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Firewall | Default = <None> (No firewall)<br><br>Allows the selection of a system firewall which the IP Office applies to traffic routed from LAN2 to LAN1. |

## VoIP

Navigation: **System Settings > System > VoIP > VoIP**

This tab is used to set the codecs available for use with all IP lines and extensions and the default order of codec preference.

- Avaya H.323 telephones do not support G.723 and ignore it if selected.
- For IP Office systems with H.323 lines and extensions, one of the G.711 codecs must be selected.
- G.723 and G.729b are not supported by Linux-based IP Office systems.
- The number of channels provided by an IP500 VCM 32 or IP500 VCM 64 card, up to a maximum of 32 or 64 respectively, depends on the actual codecs being used. This also

applies to IP500 VCM 32 V2 and IP500 VCM 64 V2 cards. The following table assumes that all calls using the VCM use the same codec.

| Codec  | IP500 VCM 32 IP500 VCM 32 V2 | IP500 VCM 64 IP500 VCM 64 V2 |
|--------|------------------------------|------------------------------|
| G.711  | 32                           | 64                           |
| G.729a | 30                           | 60                           |
| G.723  | 22                           | 44                           |
| G.722  | 30                           | 60                           |

Paging from an IP device uses the preferred codec of that device. It is the system administrator's responsibility to ensure all the target phones in the paging group support that codec.

These settings must be edited offline. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>RFC2833 Default Payload</b> | <p>Default = 101. Range = 96 - 127.</p> <p>This field specifies the default value for RFC2833 dynamic payload negotiation. Service providers that do not support dynamic payload negotiation may require a fixed value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>OPUS Default Payload</b>    | <p>Default = 116.</p> <p>This field specifies the default value and the range to be used for Opus codec.</p> <p>This field is only used for Linux-based systems.</p> <p> <b>Note:</b></p> <p>This field is not available on IP500v2, but the <b>Unknown Codec passthrough</b> and the <b>OPUS</b> settings are available to set individually.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Available Codecs</b>        | <p>This list shows the codecs supported by the system and those selected as usable. Those codecs selected in this list are then available for use in other codec lists shown in the configuration settings. For example, the adjacent <b>Default Selection</b> list and the individual custom selection list on IP lines and extensions.</p> <p> <b>Warning:</b></p> <p>Removing a codec from this list automatically removes it from the codec lists of any individual lines and extensions that are using it.</p> <p>The supported codecs (in default preference order) are: Opus, G.711 A-Law, G.711 U-Law, G.722, G.729, and G.723.1. The default order for G.711 codecs varies to match the default companding settings of the system. G.723.1 and G.729b are not supported on Linux-based systems.</p> |
| <b>Default Codec Selection</b> | <p>By default, all IP (H.323 and SIP) lines and extensions added to the system have their <b>Codec Selection</b> setting set to <b>System Default</b>. That setting matches the codec selections made in this list. The buttons between the two lists can be used to move codecs between the <b>Unused</b> and the <b>Selected</b> parts of the list and to change the order of the codecs in the selected codecs list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## VoIP Security

Navigation: **System Settings > System > VoIP Security**

Use to set system level media security settings. These settings apply to all lines and extensions on which SRTP is supported and which have their **Media Security** settings configured to be **Same as System**. Individual lines and extensions have media security settings that can override system level settings.

Simultaneous SIP extensions that do not have physical extensions in the configuration use the system security settings.

SM lines and all centralized user extensions must have uniform media security settings.

These settings must be edited offline. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

# Configuration settings

LDAP (Lightweight Directory Access Protocol) is a software protocol for enabling anyone to locate organizations, individuals, and other resources such as files and devices in a network. It can also be used to import directory information.

The IP Office supports both LDAP V2 and LDAP V3:

- **LDAP v2:** This menu (**System Settings > System > Directory Services > LDAP** ) supports LDAP v2 direct from the IP Office service.
- **LDAP v3:** The Collaboration service on IP Office R11.1.2 and higher Linux-based IP Office servers supports LDAP v3. For IP500 V2 servers, the Collaboration service is provided by an IP Office Application Server. Using IP Office Web Manager, see **Solution > Solution Settings > User Synchronization Using LDAP**.

 **Tip:**

- IP Office systems also support the import of directory records from another IP Office using HTTP. That includes using HTTP to import records that the other IP Office has imported using LDAP.

LDAP records can contain several telephone numbers. Each will be treated as a separate directory record when imported into the system directory.

An LDAP directory is organized in a simple "tree" hierarchy consisting of the following levels:

- The "root" directory (the starting place or the source of the tree), which branches out to
- Countries, each of which branches out to
- Organizations, which branch out to
- Organizational units (divisions, departments, and so forth), which branches out to (includes an entry for)
- Individuals (which includes people, files, and shared resources such as printers)

An LDAP directory can be distributed among many servers. Each server can have a replicated version of the total directory that is synchronized periodically. An LDAP server is called a Directory System Agent (DSA). An LDAP server that receives a request from a user takes responsibility for the request, passing it to other DSA's as necessary, but ensuring a single coordinated response for the user.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field               | Description                                                                                                                                                                                                                                                  |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LDAP Enabled</b> | Default = Off<br><br>This option turns LDAP support on or off. If the server being queried is an LDAP V3 server, support for LDAP V2 may need to be enabled on that server. LDAP V3 servers typically support LDAP V2 but do not have it enabled by default. |

| Field                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>User Name</b>             | <p>Default = Blank</p> <p>Enter the user name to authenticate connection with the LDAP database. To determine the domain-name of a particular Windows user look on the "Account" tab of the user's properties under "Active Directory Users and Computers". Note that this means that the user name required is not necessarily the same as the name of the Active Directory record. There should be a built-in account in Active Directory for anonymous Internet access, with prefix "IUSR_" and suffix server_name. Thus, for example, the user name entered in this field might be: IUSR_CORPSERV@example.com</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Password</b>              | <p>Default = Blank</p> <p>Enter the password to be used to authenticate connection with the LDAP database. Enter the password that has been configured under Active Directory for the above user.</p> <p>Alternatively, an Active Directory object may be made available for anonymous read access. This is configured on the server as follows.</p> <ol style="list-style-type: none"> <li>1. In <b>Active Directory Users and Computers</b>, enable <b>Advanced Features</b> under the <b>View</b> menu.</li> <li>2. Open the properties of the object to be published and select the <b>Security</b> tab.</li> <li>3. Click <b>Add</b> and select <b>ANONYMOUS LOGON</b> and click <b>Add</b> and then <b>OK</b></li> <li>4. Click <b>Advanced</b> and select <b>ANONYMOUS LOGON</b>.</li> <li>5. Click <b>View/Edit</b> and change <b>Apply to</b> to <b>This object and all child objects</b>.</li> <li>6. Click <b>OK</b> to exit the menus.</li> <li>7. Once this has been done on the server, any record can be made in the <b>User Name</b> field in the <b>System</b> configuration form (however, this field cannot be left blank) and the <b>Password</b> field left blank. Other non-Active Directory LDAP servers may allow totally anonymous access, in which case neither <b>User Name</b> nor <b>Password</b> need be configured.</li> </ol> |
| <b>Server IP Address</b>     | <p>Default = Blank</p> <p>Enter the IP address of the server storing the database.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Server Port</b>           | <p>Default = 389</p> <p>This setting is used to indicate the listening port on the LDAP server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Authentication Method</b> | <p>Default = Simple</p> <p>Select the authentication method to be used. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Simple</b>: clear text authentication</li> <li>• <b>Kerberos</b>: Not used.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### Additional configuration information

For additional configuration information, see [Centralized System Directory](#) on page 738.

### Configuration settings

The system can use HTTP to import the directory records held by another system. Note that support for HTTP can be disabled. The setting **System Settings > System > System > Avaya HTTP Clients Only** can restrict a system from responding to HTTP requests. The system's **Unsecured Interfaces** security settings also included controls for HTTP access (**HTTP Directory Read** and **HTTP Directory Write**).

For Server Edition, on Secondary Server, Expansion System (L) and Expansion System (V2) systems, the HTTP settings are automatically defaulted to obtain the system directory from the Primary Server.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

## Telephony

Navigation: **System Settings > System > Telephony**

**Additional configuration information**

- The **Directory Overrides Barring** setting allows you to control barred numbers. For additional configuration information, see [Call Barring](#) on page 825.
- The **Inhibit Off-Switch Forward/Transfer** stops any user from transferring or forwarding calls externally. For additional information, see [Off-Switch Transfer Restrictions](#) on page 906.
- For additional information regarding the **Media Connection Preservation** setting, see [Media Connection Preservation](#) on page 747.

**Configuration settings**

Used to configure a wide range of general purpose telephony settings for the whole system.

These settings can be edited online with the exception of **Companding LAW** and **Media Connection Preservation**. These settings must be edited offline and requires a reboot of the system. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

**Analog Extensions**

These settings apply only to analog extension ports provided by the system. For Server Edition this field is only available on Expansion System (V2) systems

| Field                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default Outside Call Sequence</b>            | <p>Default = Normal. See <a href="#">Ring Tones</a> on page 779.</p> <p>This setting is only used with analog extensions. It sets the ringing pattern used for incoming external calls. For details of the ring types see <b>System Settings &gt; System &gt; Telephony &gt; Ring Tones</b>.</p> <p>This setting can be overridden by a user's <b>Call Management &gt; Users &gt; Add/Edit Users &gt; Telephony &gt; Call Settings &gt; Outside Call Sequence</b> setting. Note that changing the pattern may cause fax and modem device extensions to not recognize and answer calls.</p> |
| <b>Default Inside Call Sequence</b>             | <p>Default = Ring Type 1. See <a href="#">Ring Tones</a> on page 779.</p> <p>This setting is only used with analog extensions. It sets the ringing pattern used for incoming internal calls. For details of the ring types see <b>System Settings &gt; System &gt; Telephony &gt; Ring Tones</b>. This setting can be overridden by a user's <b>Call Management &gt; Users &gt; Add/Edit Users &gt; Telephony &gt; Call Settings &gt; Inside Call Sequence</b> setting.</p>                                                                                                                |
| <b>Default Ring Back Sequence</b>               | <p>Default = Ring Type 2. See <a href="#">Ring Tones</a> on page 779.</p> <p>This setting is only used with analog extensions. It sets the ringing pattern used for ringback calls such as hold return, park return, voicemail ringback, and Ring Back when Free. For details of the ring types see <b>System Settings &gt; System &gt; Telephony &gt; Ring Tones</b>.</p> <p>This setting can be overridden by a user's <b>Call Management &gt; Users &gt; Add/Edit Users &gt; Telephony &gt; Call Settings &gt; Ringback Call Sequence</b> setting.</p>                                  |
| <b>Restrict Analog Extension Ringer Voltage</b> | <p>Default = Off.</p> <p>Supported on IP500 V2 systems only. If selected:</p> <ul style="list-style-type: none"> <li>• The ring voltage on analog extension ports on the system is limited to a maximum of 40V Peak-Peak.</li> <li>• The message waiting indication (MWI) settings for analog extension are limited to <b>Line Reversal A</b>, <b>Line Reversal B</b> or <b>None</b>.</li> <li>• Any analog extension already set to another MWI setting is forced to <b>Line Reversal A</b>.</li> </ul>                                                                                   |

## Companding Law

| Field                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Companding Law</b> | <p>These settings should not normally be changed from their defaults. They should only be used where 4400 Series phones (ULAW) are installed on systems which have A-Law digital trunks.</p> <p><b>A-Law or U-Law</b> PCM (Pulse Code Modulation) is a method for encoding voice as data. In telephony, two methods of PCM encoding are widely used, A-Law and U-Law (also called Mu-Law or <math>\mu</math>-Law). Typically U-Law is used in North America and a few other locations while A-Law is used elsewhere. As well as setting the correct PCM encoding for the region, the A-Law or U-Law setting of a system when it is first started affects a wide range of regional defaults relating to line settings and other values.</p> <p>For IP500 V2 systems, the encoding default is set by the type of Feature Key installed when the system is first started. The cards are either specifically A-Law or U-Law.</p> |

## Telephony

| Field                         | Description                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Dial Delay Time (secs)</b> | <p>Default = 4 (USA/Japan) or 1 (ROW). Range = 1 to 30 seconds.</p> <p>This setting sets the time the system waits following a dialed digit before it starts looking for a short code match. In situations where there are potential short codes matches but not exact match, it also sets the delay following the dialing of a digit before dialing complete is assumed.</p> |
| <b>Dial Delay Count</b>       | <p>Default = 0 digits (USA/Japan) or 4 digits (ROW). Range = 0 to 30 digits.</p> <p>This setting sets the number of digits dialed after which the system starts looking for a short code match regardless of the <b>Dial Delay Time</b>.</p>                                                                                                                                  |

| Field                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call Priority Promotion Time (secs)</b> | <p>Default = Disabled. Range = Disabled, 10 to 999 seconds.</p> <p>When calls are queued for a hunt group, higher priority calls are placed ahead of lower priority calls, with calls of the same priority sort by time in queue. External calls are assigned a priority (<b>1-Low</b>, <b>2-Medium</b> or <b>3-High</b>) by the Incoming Call Route that routed the call. Internal calls are assigned a priority of <b>1-Low</b>. This option can be used to increase the priority of a call each time it has remained queued for longer than this value. The calls priority is increased by 1 each time until it reaches 3-High.</p> <p>In situations where calls are queued, high priority calls are placed before calls of a lower priority. This has a number of effects:</p> <ul style="list-style-type: none"> <li>• Mixing calls of different priority is not recommended for destinations where Voicemail Pro is being used to provide queue ETA and queue position messages to callers since those values will no longer be accurate when a higher priority call is placed into the queue. Note also that Voicemail Pro will not allow a value already announced to an existing caller to increase.</li> <li>• If the addition of a higher priority call causes the queue length to exceed the hunt group's Queue Length Limit, the limit is temporarily raised by 1. This means that calls already queued are not rerouted by the addition of a higher priority call into the queue.</li> </ul> |
| <b>Default Currency</b>                    | <p>Default = Locale specific.</p> <p>This setting is used with ISDN Advice of Charge (AOC) services. Note that changing the currency clears all call costs stored by the system except those already logged through SMDR. The currency is displayed in the system SMDR output.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Default Name Priority</b>               | <p>Default = Favor Trunk.</p> <p>For SIP trunks, the caller name displayed on an extension can either be that supplied by the trunk or one obtained by checking for a number match in the extension user's personal directory and the system directory. This setting determines which method is used by default. For each SIP line, this setting can be overridden by the line's own <b>Name Priority</b> setting if required. Select one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>Favor Trunk:</b> Display the name provided by the trunk. For example, the trunk may be configured to provide the calling number or the name of the caller. The system should display the caller information as it is provided by the trunk. If the trunk does not provide a name, the system uses the <b>Favor Directory</b> method.</li> <li>• <b>Favor Directory:</b> Search for a number match in the extension user's personal directory and then in the system directory. The first match is used and overrides the name provided by the SIP line. If no match is found, the name provided by the line, if any, is used.</li> </ul>                                                                                                                                                                                                                                                                                                                                               |
| <b>Media Connection Preservation</b>       | <p>Default = Enabled.</p> <p>When enabled, attempts to maintain established calls despite brief network failures. Call handling features are no longer available when a call is in a preserved state. When enabled, Media Connection Preservation applies to SCN links and Avaya H.323 phones that support connection preservation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Restrict Network Interconnect</b>           | <p>Default = Off.</p> <p>When this option is enabled, each trunk is provided with a <b>Network Type</b> option that can be configured as either <b>Public</b> or <b>Private</b>. The system will not allow calls on a public trunk to be connected to a private trunk and vice versa, returning number unobtainable indication instead.</p> <p>Due to the nature of this feature, its use is not recommended on systems also using any of the following other system features: multi-site networks, VPNremote, application telecommuter mode.</p> |
| <b>Include location specific information</b>   | <p>Default = Off.</p> <p>When set to On, this setting is available in the trunk configuration settings when <b>Network Type</b> is set to <b>Private</b>.</p> <p>Set to <b>On</b> if the PBX on the other end of the trunk is toll compliant.</p>                                                                                                                                                                                                                                                                                                 |
| <b>Drop External Only Impromptu Conference</b> | <p>Default = On.</p> <p>If selected, when the last remaining internal user in a conference exits the conference, the conference is ended, regardless of whether it contains any external callers.</p> <p>If not selected, the conference is automatically ended when the last internal party or trunk that supports reliable disconnect exits the conference. The Inhibit Off-Switch Forward/Transfer option above is no longer applied to conference calls.</p>                                                                                  |
| <b>Visually Differentiate External Call</b>    | <p>Default = Off.</p> <p>This setting is applied to the lamp flashing rate used for bridged appearance and call coverage appearance buttons on 1400, 1600 and 9600 Series phones and on their button modules. When selected, external calls alerting on those buttons will use a slow flash (200ms on/50ms off). If not selected or if the call is internal, normal flashing (500ms on/500ms off) is used.</p>                                                                                                                                    |

| Field                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Unsupervised Analog Trunk Disconnect Handling</b> | <p>Default = Off.</p> <p>When using analog trunks, various methods are used for trunk supervision. That is to detect when the far end of the trunk has disconnected and so disconnect the local end of the call. Depending on the locale, the system uses Disconnect Clear signaling and or Busy Tone Detection. This setting should only be enabled if it is known that the analog trunks do not provide disconnect clear signaling or reliable busy tone. For Server Edition this field is only available on Expansion System (V2) systems.</p> <p>When enabled:</p> <ul style="list-style-type: none"> <li>• Disconnect Clear signaling detection is disabled. Busy tone detection remains on.</li> <li>• Unsupervised transfers and trunk-to-trunk transfers of analog trunk calls are not allowed. The <b>Allow Analog Trunk to Trunk Connect</b> setting on analog trunks (Line   Analog Options) is disabled.</li> <li>• If Voicemail Pro is being used for external call transfers, <b>Supervised Transfer</b> actions should be used in call flows rather than <b>Transfer</b> actions.</li> <li>• All systems in the network must have this setting set to match each other.</li> </ul> |
| <b>High Quality Conferencing</b>                     | <p>Default = On.</p> <p>Supports the use of the G.722 codec. IP lines and extensions using G.722 are provided with wide band audio. If <b>High Quality Conferencing</b> is enabled, when several wide band audio devices are in the same conference, the system will ensure that the audio between them remains wide band, even if the conference also contains other lines and devices using narrow band audio (analog devices, digital devices and IP devices using codecs other than G.722).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Digital/Analogue Auto Create User</b>             | <p>Default = On. (IP500 V2 only. Default = Off for Server Edition/On for others)</p> <p>When enabled, an associated user is created for each digital/analogue extension created. Digital/analogue extension creation occurs on initial start up, reset of configuration, or addition of new digital/analogue expansion units or plug-in modules.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Directory Overrides Barring</b>                   | <p>Default = On.</p> <p>When enabled, barred numbers are not barred if the dialed number is in the External Directory.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Field                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Advertize Callee State To Internal Callers</b> | <p>Default = Off.</p> <p>When enabled, for internal calls, additional status information is communicated to the calling party.</p> <p>Not supported for SIP endpoints except for J100 Series phones (not including the J129).</p> <ul style="list-style-type: none"> <li>When calling another internal phone and the called phone is set to Do Not Disturb or on another call, the calling phone displays “Do Not Disturb” or “On Another Call” rather than “Number Busy”.</li> <li>On 9400, 9500, 9600, and J100 Series phones, if a line appearance is programmed on a button on phone A and that line is in use on phone B, then phone A displays the name of the current user of the line and the line number.</li> <li>If a line appearance on a phone is in use elsewhere in the system and another extension unsuccessfully attempts to seize that line, the phone displays “In Use:&lt;name&gt;” where &lt;name&gt; is the name of the user currently using the line.</li> </ul> <p>This configuration parameter sets the system wide default. Individual users can be configured for this feature using the setting <b>Call Management &gt; Users &gt; Add/Edit Users &gt; Telephony &gt; Call Settings &gt; Advertize Callee State To Internal Callers</b></p> |
| <b>Internal Ring on Transfer</b>                  | <p>Default = Off.</p> <p>When enabled, the transfer enquiry calls ring with internal ring tone even if the call being transferred is external. If the user completes the transfers before being answered, the ring tone played to the target changes to the ring tone appropriate for the call being transferred.</p> <p>This feature is supported on phone series: 1400, 1600, 9400, 9500, 9600, J100 and analog phones. This feature is not supported on SIP and H.323 DECT phones.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Login Code Complexity

Defines the requirements for the login code.

| Field                 | Description                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enforcement</b>    | <p>Default = On.</p> <p>When on, a user PIN is required.</p>                                                                                                                                                                                                                                                                                             |
| <b>Minimum Length</b> | <p>Default = 6. Maximum 15 digits.</p> <p>The number of users with login codes less than six digits is displayed below the field in red colored text.</p>                                                                                                                                                                                                |
| <b>Complexity</b>     | <p>Default = On.</p> <p>When on, the following complexity rules are enforced.</p> <ul style="list-style-type: none"> <li>The user extension number cannot be used.</li> <li>A PIN consisting of repeated digits is not allowed (111111).</li> <li>A PIN consisting of forward or backward sequence are not allowed. Examples: 123456, 654321.</li> </ul> |

## RTCP Collector Configuration

| Field                                 | Description                                                                                                                                                                                                                           |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Send RTCP to an RTCP Collector</b> | When the check box is selected, system RTCP reporting is enabled. For IP Office Release 10.0 and higher, in addition to having the individual phones send RTCP call quality reports, the system can also send RTCP reports for calls. |
| <b>Server Address</b>                 | This Sets the address of the third-party QoS monitoring application to which the system sends RTCP reports.                                                                                                                           |
| <b>UDP Port Number</b>                | The destination port. The default for this field is 5005.                                                                                                                                                                             |
| <b>RTCP reporting interval (secs)</b> | This setting sets the time interval at which the system sends RTCP reports.                                                                                                                                                           |

## Park and Page

Navigation: **System Settings > System > Telephony > Park and Page**

The Park and Page tab allows for simple configuration of the of the short code and the programmable button for the park and page function.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Central Park Range</b>     | Default = Blank. Range = nX to nnnnnnnXX The park slot ID range definition, where n is a digit sequence from 1 to 9999999 and X represents a park slot value from 0 to 99. The Central Park Range cannot exceed 9 characters total length.<br><br>Examples: <ul style="list-style-type: none"> <li>• 1X defines range 10-19</li> <li>• 3XX defines range 300-399</li> <li>• 9876543XX defines range 987654300-987654399</li> </ul> |
| <b>Page Target Group List</b> | Default = Blank. The list of paging group targets that are presented on supported phones if the Page action is requested after the Call Park.<br><br>On some phones, only the first three groups can be presented as Page options (via the Softkeys on the phone). On phones that support scrolling lists, a larger list of possible Page targets can be presented.                                                                |

## Tones and Music

Navigation: **System Settings > System > Telephony > Tones and Music**

## Additional configuration information

For additional information on configuring hold music, see [Music On Hold](#) on page 781.

### Configuration settings

Used to configure the various tones and music on hold sources used by the system.

The settings can be edited online except for **Disconnect Tone** and **Busy Tone Detection**. These settings must be edited offline and requires a reboot of the system. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

| Field                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conferencing Tone</b>   | <p>Default = Entry &amp; Exit Tones.</p> <p>This settings controls how conference tones are used. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Entry &amp; Exit Tones</b><br/>A single tone is heard when a new party joins a conference and double-tone is heard when a party leaves the conference.</li> <li>• <b>Repeating Tone</b><br/>A conference tone is heard every 10 seconds by all conference parties.</li> </ul>                                                                                                                                                                                                                                                                                                                        |
| <b>Disconnect Tone</b>     | <p>Default = Default (Use locale setting).</p> <p>For digital and IP phones, when the system detects that the far end of a call has disconnected, it can make the near end either go idle or play disconnect tone (analog phones always play disconnect tone).</p> <p>By default, the chosen behavior depends on the system locale. Note also that when using disconnect tone, the tone used depends on the system locale.</p> <ul style="list-style-type: none"> <li>• <b>Default</b><br/>Use the system locale default for disconnected calls. See <i>Avaya IP Office Locale Settings</i>.</li> <li>• <b>On</b><br/>Play disconnect tone when far end disconnection is detected.</li> <li>• <b>Off</b><br/>Go idle when far end disconnection is detected.</li> </ul> |
| <b>Busy Tone Detection</b> | <p>Default = Off.</p> <p>Enables or disables the use of busy tone detection for call clearing. This is a system wide setting.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>CLI Type</b>            | <p>This field is used to set the CLI detection used for incoming analog trunks. Note that the CLI Type field is shown for locales other than <b>Customize</b>.</p> <p>For the <b>Customize</b> locale, it is set through the <b>System Settings &gt; System &gt; System</b> form.</p> <p>The options are <b>DTMF</b>, <b>FSK V23</b> or <b>FSK BELL202</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Busy Tone Detection</b> | <p>Default = System Frequency (Defined by system locale. See <i>Avaya IP Office Locale Settings</i>.)</p> <p>Allows configuration of the system's busy tone detection settings on lines that do not provide reliable disconnect signaling. In that case, the system will use tone disconnect clearing to disconnect such lines after 6 seconds of continuous tone.</p> <ul style="list-style-type: none"> <li>• The settings should only be adjusted if advised by Avaya Technical Support.</li> <li>• Changes to this setting require a reboot when the new configuration is sent to the system.</li> <li>• For Server Edition, this field is only available on Expansion System (V2) systems.</li> </ul> |

## Hold Music

This section is used to define the source for the system's music on hold source. You must ensure that any MOH source you use complies with copyright, performing rights and other local and national legal requirements.

Server Edition deployments support centralized music on hold, where the Primary Server streams music to the Secondary Server and all expansion servers.

The WAV file properties must be:

- PCM, 8kHz 16-bit Mono.
- Maximum length: 90 seconds on IP500 V2 systems, 600 seconds on Linux-based systems.

If the file downloaded is in the incorrect format, it will be discarded from memory after the download.

### **Caution:**

Copying files in the incorrect format directly into the `opt/ipoffice/system/primary` directory can disable the music on hold function.

The WAV file used as the system source must be named `HoldMusic.wav`. For WAV files used as alternate sources WAV files:

- Up to 27 IA5 characters with no spaces.
- Any file extension.
- On Linux-base systems, the filename is case sensitive.

## Additional configuration information

For additional ring tone configuration information, see [Ring Tones](#) on page 779

## Configuration settings

Used to configure distinct ring tones for groups and incoming call routes. Ring tone override features are only supported on 1400, 9400, 9500, and J100 Series (except J129) phones.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Branch Prefix</b>          | <p>Default = Blank. Maximum range = 15 digits.</p> <p>This number is used to identify the IP Office system within the Avaya Aura® network. On calls routed via an SM Line, the branch prefix is added as a prefix to the caller's extension number.</p> <ul style="list-style-type: none"> <li>• The branch prefix of each IP Office system must be unique and must not overlap. For example 85, 861 and 862 are okay, but 86 and 861 overlap.</li> <li>• You can leave the prefix blank. If you do not configure the branch prefix, the IP Office user extensions must be defined with the user's full enterprise extension number.</li> </ul> |
| <b>Local Number Length</b>    | <p>Default = Blank (Off). Range = Blank or 3 to 9 in deployments with IP Office users and blank or 3 to 15 in deployments with only centralized users.</p> <p>This field sets the default length for extension numbers for extensions, users, and hunt groups added to the IP Office configuration. Entry of an extension number of a different length will cause an error warning.</p> <p>The number of digits entered in the <b>Branch Prefix</b> field plus the value entered in the <b>Local Number Length</b> field must not exceed 15 digits. You can leave the <b>Local Number Length</b> field blank.</p>                               |
| <b>Proactive Monitoring</b>   | <p>Default = 60 seconds. Range = 60 seconds to 100000 seconds.</p> <p>The branch IP Office system sends regular <code>SIP OPTIONS</code> messages to the SM line in order to check the status of line. This setting controls the frequency of those messages when the SM line is currently in service.</p>                                                                                                                                                                                                                                                                                                                                      |
| <b>Monitoring Retries</b>     | <p>Default = 1. Range = 0 to 5.</p> <p>The number of times the branch IP Office system retries sending an <code>OPTIONS</code> request to Session Manager before the SM Line is marked out-of-service.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Reactive Monitoring</b>    | <p>Default 60 seconds. Range = 10 to 3600 seconds.</p> <p>The branch IP Office system sends regular <code>SIP OPTIONS</code> messages to the SM line in order to check the status of line. This setting controls the frequency of those messages when the SM line is currently out-of-service.</p>                                                                                                                                                                                                                                                                                                                                              |
| <b>User Shortcode Routing</b> | <p>Default = Rainy day.</p> <p>Set when user dialing should be checked against IP Office user short codes and processing of matches applied:</p> <ul style="list-style-type: none"> <li>• <b>Rainy day</b> - Only check when no SM line connection is available.</li> <li>• <b>Always</b> - Always check.</li> </ul>                                                                                                                                                                                                                                                                                                                            |

## Call Log

Navigation: **System Settings > System > Telephony > Call Log**

The IP Office stores a centralized call log for each user:

- The user's centralized call log is stored by the IP Office system on which the user is configured. If the user is logged in on another system, new call log records are sent to the user's home IP Office system, but using the time and date on the IP Office system where the user is logged in.
- Each user's centralized call log can contain 30 (IP500 V2) or 60 (Server Edition) call records. Each new call record replaces the oldest previous record when it reaches the limit.
- By default, the centralized call log is displayed on Avaya phones with a fixed **Call Log** or **History** button (1400, 1600, 9400, 9500, 9600, and J100 Series) and in the one-X Portal, Avaya Workplace Client, and IP Office User Portal applications.
- The centralized call log moves with the user as they log onto different phones and IP Office applications.
- The missed call count is updated per unique caller, not per call.

These settings control the IP Office systems default application of user centralized call logs. Additional user specific settings (**User > Telephony > Call Log**) can override and change the system settings.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

## TUI

Navigation: **System Settings > System > Telephony > TUI**

Used to configure system wide telephony user interface (TUI) options for 1400, 1600, 9400, 9500, 9600 and J100 Series phones (except the J129).

Use these settings to define the default phone display when feature menus are disabled. Note that for new users, the default phone display options are set to the system default values.

Feature menus can be disabled in one of two ways.

- Set **System Settings > System > Telephony > TUI > Features Menu** to **Off**. Set **Call Management > Users > Add/Edit Users > Telephony > TUI > User Setting** to **Same as System**.
- On **Call Management > Users > Add/Edit Users > Telephony > TUI**, set **User Setting** to **Custom** and set **Features Menu** to **Off**.

## Configuration settings

These settings can be edited online. Changes to these settings do not require a reboot of the system.

## Contact Center

Navigation: **System Settings > System > Contact Center**

The Contact Center tab contains the user information required by IP Office to synchronize account information with an Avaya Contact Center Select (ACCS) system. The information is synchronized using the Contact Center Management Application (CCMA). These settings are only used for the deployment of an ACCS system.

This tab is visible on the Server Edition Primary Server and Standard Mode IP500 V2 systems.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                             | Description                                                                                                                                                                                                                                               |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Contact Center Application</b> | <p>Default = None.</p> <p>The options are:</p> <ul style="list-style-type: none"> <li>• Avaya Contact Center Select</li> <li>• Avaya IP Office Contact Center</li> <li>• Integrated Contact Reporter (not supported in IP Office Release 11.0)</li> </ul> |

## Avaya Cloud Services

Navigation: **System Settings > System > Avaya Cloud Services**

The **Avaya Cloud Services** tab contains configuration settings for features that use Avaya Cloud Services. For details, see the *IP Office Avaya Workplace Client Installation Notes* manual.

- Features that use Avaya Cloud Services are not supported for Avaya Workplace Client when using IPv6.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                             | Description                                                                                                                                                                                                                                               |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Profile Name</b>               | Default = None<br><br>This name is used to identify the IP Office in the profile settings written into Avaya Cloud Services if <b>Enable Settings File URL Sync</b> is enabled.<br><br>• Within a multi-site network, the name must be unique.            |
| <b>Enable Avaya Cloud Account</b> | Default = Disabled<br><br>Enable interoperation between the IP Office and Avaya Cloud Services.<br><br>• You must also add the <b>Avaya Spaces API Key</b> and <b>Avaya Spaces Key Secret</b> for the customer domain to the IP Office security settings. |

## AVAYA CLOUD ACCOUNT CONFIGURATION

| Field                 | Description                                                                                                                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Account URL</b>    | <p>Ensure that the URL matches the appropriate value below:</p> <ul style="list-style-type: none"> <li>• IP500 V2 = <code>accounts-ipo.avayacloud.com</code></li> <li>• Linux-based Server = <code>accounts.avayacloud.com</code></li> </ul> |
| <b>Company Domain</b> | <p>Default = Blank</p> <p>The company domain registered and verified with Avaya Cloud Services.</p>                                                                                                                                          |

## USER SYNCHRONIZATION

| Field                   | Description                                                                                                                                                                                                                                                                                                               |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enable user sync</b> | <p>Default = Disabled</p> <p>If enabled, the IP Office system automatically synchronizes user information with Avaya Cloud Services.</p>                                                                                                                                                                                  |
| <b>Manual user sync</b> | <p>Default = Disabled</p> <p>This option is only available in IP Office Web Manager.</p> <ul style="list-style-type: none"> <li>• You can use the <b>Refresh</b> button to request an manual synchronization.</li> <li>• The <b>Synchronization Status</b> field shows the result of the last synchronization.</li> </ul> |

## SETTINGS FILE URL SYNCHRONIZATION

| Field                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The allows Avaya Workplace Client users to connect to the IP Office using their <b>Unique Identity</b> email address.</li> <li>• Avaya Cloud Services needs address details for each IP Office that is acting as a SIP registrar.</li> </ul> <p>The possible settings are:</p> <ul style="list-style-type: none"> <li>• <b>Enable for IP Office current Node</b> <p>Send settings file information for just the current IP Office system.</p> </li> <li>• <b>Enable for all IP Office Nodes</b> <p>Send settings file information for all IP Office systems in the network.</p> </li> <li>• <b>Disabled</b> <p>Do not send settings file information from the IP Office.</p> </li> </ul> |

## AVAYA CLOUD AUTHORIZATION

Cloud authorization enables users to login to Avaya Workplace Client using a single-sign on (SSO) account such as their Google, Office 365, or Salesforce account. It also allows initial Avaya Workplace Client registration using the user's email address.

- When using IP Office Web Manager to manage a multi-site network (not SCN), you can use the **Solution > Actions > Synchronize Single Sign-On configuration** command to synchronize these settings on other servers with those on the primary server.

| Field                                           | Description                                                                                                                                                                                                                       |

## Avaya Push Notification Services

Navigation: **System Settings > System > Avaya Push Notification Services**

Push notification is used to send Avaya Workplace Client users on Apple iOS devices notification of new calls and voicemail messages. Push notifications also requires [Avaya Cloud Services](#) on page 536 to be enabled.

For full details, refer to the *IP Office Avaya Workplace Client Installation Notes* manual.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Remote Operations

Navigation: **System Settings > System > Remote Operations**

In addition to monitoring the status and alarms of a subscription mode IP Office system, Customer Operations Management (COM) can support a number of additional services for the IP Office system. For details, refer to *Using Customer Operations Manager for IP Office Subscription Systems*.

| Settings                           | Description                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Remote Access</b>               | This option supports HTTPS, SFTP, SSH and RDP connections to IP Office servers managed by Customer Operations Management.                                                                                                                                                                                                                                                     |
| <b>Co-located Servers</b>          | <p>This option allows <b>Remote Access</b> support to extend to other servers on the same network as the IP Office system. That includes connection to UCM modules and standalone IP Office Application servers.</p> <p>This option requires configuration of a TCP tunnel for each connection through the <b>System &gt; Services &gt; Remote Support Services</b> menu.</p> |
| <b>Remote Upgrade/Backup</b>       | This option supports backup and restoration from IP Office to COM. Enabling the <b>Remote Upgrade/Backup</b> setting allows automatic daily backups.                                                                                                                                                                                                                          |
| <b>Centralized Management</b>      | This option supports remote connections to IP Office servers using IP Office admin tools (System Status Application, SysMonitor and IP Office Web Manager).                                                                                                                                                                                                                   |
| <b>Centralized Diagnostics Log</b> | This option supports the uploading and storage of system log files to COM.                                                                                                                                                                                                                                                                                                    |

# Chapter 35: Time Profiles

## System Settings > Time Profiles

Time profiles contains time, date and weekly schedule settings. Using those each time profile is currently either 'true' or 'false'. That value is used to change the behavior of other types of record that can be linked to the time profile such as incoming call routes.

For additional configuration information, see:

- [Configuring Time Profiles](#) on page 791
- the button action [Time Profile](#) on page 1190

## Main content pane

The **Time Profiles** main content pane lists provisioned time profiles. The contents of the list depends upon the filter options selected. Click the icons beside a profile to edit or delete.

**Bulk delete:** You can delete multiple records. Select the check box to the right of each record you want to delete and click **Delete**. You receive a prompt to confirm the deletion.

Click **Add/Edit Time Profile** to add a time profile. When you click **Add/Edit Time Profile**, you are prompted to add to time profile as a common object or on a specific server.

## Add Time Profile

Navigation: **System Settings > Time Profiles > Add/Edit Time Profile**

### Additional configuration information

This type of configuration record can be saved as a template and new records created from a template. See [Working with Templates](#) on page 810.

### Configuration settings

When configuring a time profile, you must enter the **Name** on the **Time Profile** page and then click **Add/Edit Time Profile Entry** to open the Recurrence pattern window.

For a time profile with multiple records, for example a week pattern and some calendar records, the profile is valid when any entry is valid. For Server Edition, this type of configuration record can be saved as a template and new records created from a template.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

- For systems using record consolidation, you can only add and edit this type of record at the solution level. The record is then automatically copied to each IP Office system in the network.

# Chapter 36: Tunnel

Tunneling allows additional security to be applied to IP data traffic. This is useful when sites across an unsecure network such as the public internet. The IP500 V2 system supports two methods of tunneling, L2TP and IPSec. Once a tunnel is created, it can be used as the destination for selected IP traffic in the IP Route table.

- The use of tunnels is only supported on non-Subscription IP Office IP500 V2 systems.

| Type         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>L2TP</b>  | Layer 2 Tunneling Protocol PPP (Point to Point Protocol) authentication normally takes place between directly connected routing devices. For example when connecting to the internet, authentication is between the customer router and the internet service provider's equipment. L2TP allows additional authentication to be performed between the routers at each end of the connection regardless of any intermediate network routers. The use of L2TP does not require a license. |
| <b>IPSec</b> | IPSec allows data between two locations to be secured using various methods of sender authentication and or data encryption. The use of IPSec requires entry of an IPSec Tunneling license into the system at each end.                                                                                                                                                                                                                                                                |

## IP Security Tunnel

IPSec allows data between two locations to be secured using various methods of sender authentication and or data encryption. The use of IPSec requires entry of an IPSec Tunneling license into the system at each end.

# Chapter 37: User Rights

## System Settings > User Rights

User rights can be used to override some of the individual settings of some users. Changes to the user rights are then automatically applied to all those users rather than having to individually edit each user.

For additional configuration information, see [Configuring User Rights](#) on page 862.

### Main content pane

The **User Rights** main content pane lists provisioned user rights. The contents of the list depends on the filter options selected. Click the icons beside a record to edit or delete.

**Bulk delete:** You can delete multiple records. Select the check box to the right of each record you want to delete and click **Delete**. You receive a prompt to confirm the deletion.

Click **Add/Edit User Right** to open the Add User Rights window where you can provision a user right. When you click **Add/Edit User Right**, you are prompted to specify if the user right will be a common object or specific to a server.

[User Rights](#) on page 550

## Short Codes

Navigation: **System Settings > User Rights > Add/Edit User Right > Short Codes**

Used to set and lock the user's short code set. The tab operates in the same way as the **User | Short Codes** tab. User and User Rights short codes are only applied to numbers dialed by that user. For example they are not applied to calls forwarded via the user.

### **Warning:**

User dialing of emergency numbers must not be blocked. If short codes are edited, the users ability to dial emergency numbers must be tested and maintained.

These settings are mergeable. Changes to these settings do not require a reboot of the system.

For a Server Edition network, these settings can be configured at the network level and are then automatically replicated in the configuration of all systems in the network. They can only be seen and edited at the individual system configuration level if record consolidation is switched off.

Short codes can be added and edited using the **Add**, **Remove** and **Edit** buttons. Alternatively you can right-click on the list of existing short code to add and edit short codes.

---

## Button Programming

Navigation: **System Settings > User Rights > Add/Edit User Right > Button Programming**

This tab is used to set and lock the user's programmable button set. When locked, the user cannot use **Admin** or **Admin1** buttons on their phone to override any button set by their user rights.

Buttons not set through the user rights can be set through the user's own settings. When **Apply user rights value** is selected, the tab operates in the same manner as the **User | Button Programming** tab.

These settings are mergeable. Changes to these settings do not require a reboot of the system.

For a Server Edition network, these settings can be configured at the network level and are then automatically replicated in the configuration of all systems in the network. They can only be seen and edited at the individual system configuration level if record consolidation is switched off.

### Adding Blank Buttons

There are scenarios where users are able to program their own buttons but you may want to force certain buttons to be blank. This can be done through the user's associated **User Rights** as follows:

1. Assign the action **Emulation | Inspect** to the button. This action has no specific function. Enter some spaces as the button label.
2. When pressed by the user, this button will not perform any action. However it cannot be overridden by the user.

| <b>Transfer return Time (secs)</b>         | Default = Blank (Off), Range 1 to 99999 seconds.<br><br>Sets the delay after which any call transferred by the user, which remains unanswered, should return to the user if possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Wrap up Time (secs)</b>                 | Default = 2 seconds, Range 0 to 99999 seconds.<br><br>Specifies the amount of time after ending one call before another call can ring. You may wish to increase this in a "call center" environment where users may need time to log call details before taking the next call. It is recommended that this option is not set to less than the default of 2 seconds. 0 is used for immediate ringing.                                                                                                                                                                                                                                          |
| <b>Call waiting on/Enable call waiting</b> | Default = Off<br><br>For users on phones without appearance buttons, if the user is on a call and a second call arrives for them, an audio tone can be given in the speech path to indicate a waiting call (the call waiting tone varies according to locale). The waiting caller hears ringing rather than receiving busy. There can only be one waiting call, any further calls receive normal busy treatment. If the call waiting is not answered within the no answer time, it follows forward on no answer or goes to voicemail as appropriate. User call waiting is not used for users on phones with multiple call appearance buttons. |

## Supervisor Settings

Navigation: **System Settings > User Rights > Add/Edit User Right > Telephony > Supervisor Settings**

These settings relate to user features normally only adjusted by the user's supervisor.

These settings are mergeable. Changes to these settings do not require a reboot of the system.

For a Server Edition network, these settings can be configured at the network level and are then automatically replicated in the configuration of all systems in the network. They can only be seen and edited at the individual system configuration level if record consolidation is switched off.

| Field                           | Description                                                                                                                                                                                                                                                                                                      |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Can Intrude</b>              | Default = Off<br><br>If enabled, the user can perform is allowed to perform a range of action on other user's calls. For example: <b>Call Intrude</b> , <b>Call Listen</b> , <b>Call Steal</b> and <b>Dial Inclusion</b> . See <a href="#">Call Intrusion</a> on page 838.                                       |
| <b>Cannot be Intruded</b>       | Default = On<br><br>If checked, this user's calls cannot be interrupted or acquired by users who have <b>Can Intrude</b> enabled. This setting also affects whether other users can use their appearance buttons to bridge into a call to which this user has been the longest present user.                     |
| <b>Deny Auto Intercom Calls</b> | Default = Off.<br><br>When enabled, any automatic intercom calls to the user's extension are automatically turned into normal calls.                                                                                                                                                                             |
| <b>Force Login</b>              | Default = Off<br><br>If checked, the user must log in using their <b>Login Code</b> to use an extension. For example, if Force Login is ticked for User A and user B has logged into A's phone, after B logs off A must log back. If <b>Force Login</b> was not ticked, A would be automatically logged back in. |
| <b>Force Account Code</b>       | Default = Off<br><br>If checked, the user must enter a valid account code to make an external call.                                                                                                                                                                                                              |

## Multi-line Options

Navigation: **System Settings > User Rights > Add/Edit User Right > Telephony > Multi-line Options**

### Additional configuration information

For additional configuration information, see [Appearance Button Operation](#) on page 1202.

### Configuration settings

Multi-line options are applied to a user's phone when the user is using an Avaya phones which supports appearance buttons (call appearance, line appearance, bridged and call coverage).

For a Server Edition network, these settings can be configured at the network level and are then automatically replicated in the configuration of all systems in the network. They can only be seen and edited at the individual system configuration level if record consolidation is switched off.

These settings are mergeable. Changes to these settings do not require a reboot of the system.

| Field                                  | Description                                                                                                                                                                                                                                        |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Individual Coverage Time (secs)</b> | Default = 10 seconds, Range 1 to 99999 seconds.<br>This function sets how long the phone will ring at your extension before also alerting at any call coverage users. This time setting should not be equal to or greater than the No Answer Time. |

## Call Log

Navigation: **System Settings > User Rights > Add/Edit User Right > Telephony > Call Log**

The IP Office stores a centralized call log for each user:

- The user's centralized call log is stored by the IP Office system on which the user is configured. If the user is logged in on another system, new call log records are sent to the user's home IP Office system, but using the time and date on the IP Office system where the user is logged in.
- Each user's centralized call log can contain 30 (IP500 V2) or 60 (Server Edition) call records. Each new call record replaces the oldest previous record when it reaches the limit.
- By default, the centralized call log is displayed on Avaya phones with a fixed **Call Log** or **History** button (1400, 1600, 9400, 9500, 9600, and J100 Series) and in the one-X Portal, Avaya Workplace Client, and IP Office User Portal applications.
- The centralized call log moves with the user as they log onto different phones and IP Office applications.
- The missed call count is updated per unique caller, not per call.

| Field                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Centralized Call Log</b>                 | <p>Default = System Default (On) </p> <p>This setting allows the use of centralized call logging to be enabled or disabled on a per user basis. The default is to match the system setting <b>System Settings &gt; User Rights &gt; Add/Edit User Right &gt; Telephony &gt; Call Log &gt; Default Centralized Call Log On</b>.</p> <p>The other options are <b>On</b> or <b>Off</b> for the individual user. If off is selected, the call log shown on the users phone is the local call log stored by the phone.</p> |
| <b>Delete records after (hours:minutes)</b> | <p>Default = 00:00 (Never). </p> <p>If a time period is set, records in the user's call log are automatically deleted after this period.</p>                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Groups</b>                               | <p>Default = System Default (On). </p> <p>This section contains a list of hunt groups on the system. If the system setting <b>System Settings &gt; User Rights &gt; Add/Edit User Right &gt; Telephony &gt; Call Log &gt; Log Missed Hunt Group Calls</b> has been enabled, then missed calls for those groups selected are shown as part of the users call log. The missed calls are any missed calls for the hunt group, not just group calls presented to the user and not answered by them.</p>                 |

| <b>DTMF Breakout</b><br><br>When a caller is directed to voicemail to leave a message, they can be given the option to be transferred to a different extension. The greeting message needs to be recorded telling the caller the options available. The extension numbers that they can be transferred to are entered in the fields below. These system default values can be set for these numbers and are used unless a different number is set within these user settings.<br><br>The Park & Page feature is supported when the system voicemail type is configured as <b>Embedded Voicemail</b> or <b>Voicemail Pro</b> . Park & Page is also supported on systems where Avaya Aura Messaging, Modular Messaging over SIP, or CallPilot (for Enterprise Branch with CS 1000 deployments) is configured as the central voice mail system and the local Embedded Voicemail or Voicemail Pro provides auto attendant operation. The Park & Page feature allows a call to be parked while a page is made to a hunt group or extension. This feature can be configured for Breakout DTMF 0, Breakout DTMF 2, or Breakout DTMF 3. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Reception/ Breakout (DTMF 0)</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>The number to which a caller is transferred if they press 0 while listening to the mailbox greeting rather than leaving a message (*0 on Embedded Voicemail in IP Office mode).</p> <p>For voicemail systems set to Intuity emulation mode, the mailbox owner can also access this option when collecting their messages by dialing *0.</p> <p>If the mailbox has been reached through a Voicemail Pro call flow containing a <b>Leave Mail</b> action, the option provided when 0 is pressed are:</p> <ul style="list-style-type: none"> <li>• For IP Office mode, the call follows the <b>Leave Mail</b> action's <b>Failure</b> or <b>Success</b> results connections depending on whether the caller pressed 0 before or after the record tone.</li> <li>• For Intuity mode, pressing 0 always follows the <b>Reception/Breakout (DTMF 0)</b> setting.</li> </ul> <p>When Park &amp; Page is selected for a DTFM breakout, the following drop-down boxes appear:</p> <ul style="list-style-type: none"> <li>• <b>Paging Number</b> – displays a list of hunt groups and users (extensions). Select a hunt group or extension to configure this option.</li> <li>• <b>Retries</b> – the range is 0 to 5. The default setting is 0.</li> <li>• <b>Retry Timeout</b> – provided in the format M:SS (minute:seconds). The range can be set in 15-second increments. The minimum setting is 15 seconds and the maximum setting is 5 minutes. The default setting is 15 seconds</li> </ul> |
| <b>Breakout (DTMF 2)</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | The number to which a caller is transferred if they press 2 while listening to the mailbox greeting rather than leaving a message (*2 on Embedded Voicemail in IP Office mode)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Additional configuration information

For additional configuration information, see the section “DND, Follow Me, and Forwarding” in the chapter **Configure user settings** in *Administering Avaya IP Office™ Platform with Web Manager*.

For additional configuration information, see [DND, Follow Me, and Forwarding](#) on page 866.

## Configuration settings

Display the users associated with the user rights and allows these to be changed.

These settings are mergeable.

For a Server Edition network, these settings can be configured at the network level and are then automatically replicated in the configuration of all systems in the network. They can only be seen and edited at the individual system configuration level if record consolidation is switched off.

| Field                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

# Chapter 38: WAN Port

## System Settings > WAN Port

Use these menus to configure physical and virtual WAN ports.

Click **Add/Edit WAN Port** to open the Add WAN Port page where you can provision a firewall. When you click **Add/Edit WAN Port**, you are prompted to specify the server where the WAN port will be configured.

- This type of configuration record is not available on subscription mode systems.

## Add WAN Port — Sync PPP

Navigation: **System Settings > WAN Port > Add/Edit WAN Port > Sync PPP**

Use these settings to configure a WAN port.

On IP500 V2 systems, these settings configure the leased line connected to the WAN port on the Control Unit. Normally this connection is automatically detected by the control unit. If a WAN Port is not displayed, connect the WAN cable, reboot the Control Unit and receive the configuration. The WAN Port configuration form is now be added.

These settings are not mergeable. Changes to these settings will require a reboot of the system.

| Field        | Description                                                                                                                                                                                                                                                                                           |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>  | The physical ID of the Extension port,. This parameter is not configurable; it is allocated by the system.                                                                                                                                                                                            |
| <b>Speed</b> | The operational speed of this port. For example for a 128K connection, enter 128000. This should be set to the actual speed of the leased line as this value is used in the calculation of bandwidth utilization. If set incorrectly, additional calls may be made to increase Bandwidth erroneously. |

*Table continues...*

| Field           | Description                                                                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mode</b>     | Default = SyncPPP<br>Select the protocol required. The options are: <ul style="list-style-type: none"> <li>• <b>SyncPPP</b> For a data link.</li> <li>• <b>SyncFrameRelay</b> For a link supporting Frame Relay.</li> </ul> |
| <b>RAS Name</b> | If the <b>Mode</b> is <b>SyncPPP</b> , selects the RAS service to associate with the port. If the <b>Mode</b> is <b>SyncFrameRelay</b> , the RAS Name is set through the DLCIs tab.                                         |

Navigation: **System Settings > WAN Port > Add/Edit WAN Port > Sync Frame Relay**

These settings are for Frame Relay configuration.

These settings are not mergeable. Changes to these settings will require a reboot of the system.

| Field                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Frame Management Type</b> | This must match the management type expected by the network provider. Selecting <b>AutoLearn</b> allows the system to automatically determine the management type based on the first few management frames received. If a fixed option is required the following options are supported: <ul style="list-style-type: none"> <li>• <b>Q933 AnnexA 0393</b></li> <li>• <b>Ansi AnnexD</b></li> <li>• <b>FRFLMI</b></li> <li>• <b>None</b></li> </ul>                                                                                                                                                                                             |
| <b>Frame Learn Mode</b>      | This parameter allows the DLCIs that exist on the given WAN port to be provisioned in a number of different ways. <ul style="list-style-type: none"> <li>• <b>None</b> No automatic learning of DLCIs. DLCIs must be entered and configured manually.</li> <li>• <b>Mgmt</b> Use LMI to learn what DLCIs are available on this WAN.</li> <li>• <b>Network</b> Listen for DLCIs arriving at the network. This presumes that a network provider will only send DLCIs that are configured for this particular WAN port.</li> <li>• <b>NetworkMgmt</b> Do both management and network listening to perform DLCI learning and creation.</li> </ul> |
| <b>Max Frame Length</b>      | Maximum frame size that is allowed to traverse the frame relay network.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## DLCIs

DLCIs are created for Frame Relay connections. These settings are not mergeable. Changes to these settings will require a reboot of the system.

| Field                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Frame Link Type</b> | Default = PPP<br>Data transfer encapsulation method. Set to the same value at both ends of the PVC (Permanent Virtual Channel). The options are: <ul style="list-style-type: none"> <li>• <b>None</b></li> <li>• <b>PPP</b> Using PPP offers features such as out of sequence traffic reception, compression and link level connection management.</li> <li>• <b>RFC 1490</b> RFC 1490 encapsulation offers performance and ease of configuration and more inter-working with third party CPE.</li> <li>• <b>RFC1490 + FRF12</b> Alternate encapsulation to PPP for VoIP over Frame Relay. When selected all parameters on the Service   PPP tab being used are overridden.</li> </ul> |
| <b>DLCI</b>            | Default = 100 This is the Data Link Connection Identifier, a unique number assigned to a PVC end point that has local significance only. Identifies a particular PVC endpoint within a user's physical access channel in a frame relay.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>RAS Name</b>        | Select the RAS Service you wish to use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Tc</b>              | Default = 10<br>This is the Time Constant in milliseconds. This is used for measurement of data traffic rates. The Tc used by the system can be shorter than that used by the network provider.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>CIR</b>             | (Committed Information Rate) Default = 64000 bps This is the Committed Information Rate setting. It is the maximum data rate that the WAN network provider has agreed to transfer. The committed burst size (Bc) can be calculated from the set Tc and CIR as $Bc = CIR \times Tc$ . For links carrying VoIP traffic, the Bc should be sufficient to carry a full VoIP packet including all its required headers. See the example below.                                                                                                                                                                                                                                               |
| <b>EIR</b>             | (Excess Information Rate) Default = 0 bps This is the maximum amount of data in excess of the CIR that a frame relay network may attempt to transfer during the given time interval. This traffic is normally marked as De (discard eligible). Delivery of De packets depends on the network provider and is not guaranteed and therefore they are not suitable for UDP and VoIP traffic. The excess burst size (Be) can be calculated as $Be = EIR \times Tc$ .                                                                                                                                                                                                                       |

## Advanced

These settings are used for Frame Relay connections.

These settings are not mergeable. Changes to these settings will require a reboot of the system.

| Field                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Address Length</b> | The address length used by the frame relay network. The network provider will indicate if lengths other than two bytes are to be used.                                                                                                                                                                                                                                                                                                                               |
| <b>N391</b>           | Full Status Polling Counter<br><br>Polling cycles count used by the CPE and the network provider equipment when bidirectional procedures are in operation. This is a count of the number of link integrity verification polls (T391) that are performed (that is Status Inquiry messages) prior to a Full Status Inquiry message being issued.                                                                                                                       |
| <b>N392</b>           | Error Threshold Counter<br><br>Error counter used by both the CPE and network provider equipment. This value is incremented for every LMI error that occurs on the given WAN interface. The DLCIs attached to the given WAN interface are disabled if the number of LMI errors exceeds this value when N393 events have occurred. If the given WAN interface is in an error condition then that error condition is cleared when N392 consecutive clear events occur. |
| <b>N393</b>           | Monitored Events Counter<br><br>Events counter measure used by both the CPE and network provider equipment. This counter is used to count the total number of management events that have occurred in order to measure error thresholds and clearing thresholds.                                                                                                                                                                                                     |
| <b>T391</b>           | Link Integrity Verification Polling Timer<br><br>The link integrity verification polling timer normally applies to the user equipment and to the network equipment when bidirectional procedures are in operation. It is the time between transmissions of Status Inquiry messages.                                                                                                                                                                                  |
| <b>T392</b>           | Polling Verification Timer The polling verification timer only applies to the user equipment when bidirectional procedures are in operation. It is the timeout value within which to receive a Status Inquiry message from the network in response to transmitting a Status message. If the timeout lapses an error is recorded (N392 incremented).                                                                                                                  |

# Part 5: The Security Menu

# Chapter 39: Security Administration

The security settings for access to an IP Office system are separate from the configuration settings. You can only view and edit the security settings directly from the IP Office. You cannot save the security settings as a file on your PC.

This section provides an overview of the main security settings. For more information, see the *Avaya IP Office™ Platform Security Guidelines* manual.

You can setup security using the following elements:

- Access control to prevent unauthorized use.
- Encryption to guarantee data remains private.
- Message authentication to ensure that the data has not been tampering with.
- Identity assurance to verify the data source.

## Service Users, Roles, and Rights Groups

The IP Office controls access to its settings and services using **Service Users** and **Rights Groups** stored in its security settings.

- Connecting to the IP Office requires entering a **Service Users** username and password.
- The **Rights Groups** to which the **Service Users** belongs define the permissions that the service user has.

| Feature                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Security Administrator</b> | The security administrator is a special user that differs from the service users. You can use their username and password to access and edit the security settings. However, the security administrator cannot access any other IP Office services. You cannot remove or disable this account.                                                                                                                                                                                                                                                                                                                                                              |
| <b>Service Users</b>          | Each service user has a username, a password, and is a member of one or more <b>Rights Groups</b> . The IP Office supports up to 64 service users.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Rights Groups</b>          | <p>The <b>Rights Groups</b> to which a service user belongs sets their permissions. For example:</p> <ul style="list-style-type: none"> <li>• Set whether the service user can view and/or edit the configuration settings.</li> <li>• Set which parts of the configuration settings the service user can access.</li> <li>• Set whether the service user can view and/or edit the security settings.</li> <li>• Set whether the service user can change their password.</li> </ul> <p>When a service user is a member of more than one rights group, they combine the permissions of each rights group. The IP Office supports up to 32 rights groups.</p> |

### Example Rights Assignment

In the example above:

- Service user X can read and write the configuration settings. However, they can only edit operator settings, and can only make changes that are mergeable.
- Service user Y can read and write the configuration settings. They can edit all the configuration settings, including making changes that require an IP Office reboot. They can also access the settings of the Voicemail Pro service.
- Service user Z has the same configuration access as service user Y. However, they can also view and edit the security settings.
- The security administrator can only view and edit the security settings.

### Changing Administrative Users and Rights Groups

You can use IP Office Manager and IP Office Web Manager to edit service users and rights groups. Before making any changes, you must consider the following:

- IP Office in a multi-site network must have consistent service users and rights groups. IP Office Manager and IP Office Web Manager have synchronization tools to assist in achieving this.

- All changes must follow security best practices. For example, following a password policy and only allowing minimal access rights.

## Default Service Users and Rights Groups

The following information is applicable for IP Office R11.1FP2.

### Security Administrator Account

This is the default security administration account and has all rights to all security settings. You cannot remove or disable this account.

### Default Service User Accounts

The following service user accounts are present on the first start-up, and after a security settings reset:

| Name                    | Account Status  | Description/Default Rights                                                                                                 | Default Rights Group Membership                                                     |
|-------------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| <b>Administrator</b>    | <b>Enabled</b>  | This service user is the default account for IP Office configuration. Do not remove, disable, or rename this service user. | <b>Administrator Group</b><br><b>System Status Group</b><br><b>Business Partner</b> |
| <b>AdjunctServer</b>    | <b>Disabled</b> | Subscription mode IP Office systems use this service user to enable COM support for an IP Office application server.       | <b>Adjunct Server</b>                                                               |
| <b>BranchAdmin</b>      | <b>Disabled</b> | The IP Office uses this service user for IP Office branch systems managed by SMGR.                                         | <b>SMGR Admin</b>                                                                   |
| <b>BuisnessPartner</b>  | <b>Disabled</b> | The IP Office uses this service user for configuration access by business partners.                                        | <b>Business Partner</b>                                                             |
| <b>COMAdmin</b>         | <b>Enabled</b>  | Subscription mode IP Office systems using this service user for connection to COM.                                         | <b>COM Admin</b>                                                                    |
| <b>DirectoryService</b> | <b>Enabled</b>  | The IP Office uses this service user for HTTP directory access.                                                            | <b>Directory Group</b>                                                              |
| <b>EnhTcpaService</b>   | <b>Enabled</b>  | The IP Office uses this service user for connection with the Avaya one-X <sup>®</sup> Portal service.                      | <b>TCPA Group</b>                                                                   |
| <b>IPDectService</b>    | <b>Disabled</b> | The IP Office uses this service user for Avaya Wireless DECT system provisioning.                                          | <b>IPDECT Group</b>                                                                 |
| <b>Maintainer</b>       | <b>Disabled</b> | The IP Office uses this service user for back up, restore and upgrade connections.                                         | <b>Maintainer</b>                                                                   |

*Table continues...*

| Name              | Account Status  | Description/Default Rights                                                           | Default Rights Group Membership |
|-------------------|-----------------|--------------------------------------------------------------------------------------|---------------------------------|

| TURN Server     | External               | IP Office Service Rights | TURN Server Connection                                                                                                                                       |

### Additional Rights Groups for Non-Subscription Systems

The IP Office creates these additional default rights groups on non-subscription mode systems. They have no associated default service users.

| Rights Group   | Rights Set             |                          | Rights Enabled  |
|----------------|------------------------|--------------------------|-----------------|
| Manager Group  | Configuration          | IP Office Service Rights | All             |
|                |                        | Manager Operator Rights  | Manager         |
| Operator Group | Configuration          | IP Office Service Rights | All             |
|                |                        | Manager Operator Rights  | Operator        |
| Security Admin | Security Administrator | IP Office Service Rights | All             |
| Backup Admin   | Web Services           | IP Office Service Rights | Backup, Restore |

## Access Control

The IP Office uses service user and rights group settings to control access to the IP Office settings. All connections to an IP Office service require a service user name and password. That service user must be a member of a rights group with permission to access the require service and perform the required actions.

## Example Rights Assignment

In the example above:

- Service user X can read and write the configuration settings. However, they can only edit operator settings, and can only make changes that are mergeable.
- Service user Y can read and write the configuration settings. They can edit all the configuration settings, including making changes that require an IP Office reboot. They can also access the settings of the Voicemail Pro service.
- Service user Z has the same configuration access as service user Y. However, they can also view and edit the security settings.
- The security administrator can only view and edit the security settings.

## Encryption

Encryption ensures no one else can read the data sent to and from the IP Office. Encryption is the application of a complex mathematical process at the originating end, and a reverse process at the receiving end. The process at each end uses the same 'key' to encrypt and decrypt the data:

The IP Office can encrypt any data sent using a number the following algorithms:

| Algorithm | Key size (bits) | Use              |
|-----------|-----------------|------------------|
| DES-40    | 40              | Not supported.   |
| DES-56    | 56              | Not supported.   |
| 3DES      | 112             | Low security.    |
| RC4-128   | 128             | Medium security. |
| AES-128   | 128             | High security.   |
| AES-256   | 256             | High security.   |

In general, the larger the key size, the more secure the encryption. However, smaller key sizes require less processing. The system supports encryption using the Transport Layer Security (TLS) protocol.

## Message Authentication

Message authentication enables detection of any alteration to data to and from IP Office. To support authentication, the originator of the data also sends a signature (called a hash) of the data sent. The receiver can then check that the data and the signature received match.

The IP Office can authenticate data using the following algorithms:

| Algorithm | Hash size (bits) | Use                    |
|-----------|------------------|------------------------|
| MD5       | 128              | Not recommended.       |
| SHA-1     | 160              | 'Acceptable' security. |
| SHA-2     | 256, 384, 512    | 'Strong' security      |

In general, the larger the hash size, the more secure the signature. However smaller hash sizes require less processing.

IP Office supports message authentication using the Transport Layer Security (TLS) 1.0, 1.1, and 1.2 protocol.

## Certificates

Public key cryptography is one of the ways to maintain a trustworthy networking environment. A public key certificate (also known as a digital certificate or identity certificate) is an electronic document used to prove ownership of a public key. The certificate includes information about the key, information about its owner's identity, and the digital signature of an entity that has verified the certificate's contents are correct. If the signature is valid, and the person examining the certificate trusts the signer, then they know they can use that key to communicate with its owner.

For more information, see [Certificate Management](#) on page 762.

## Implementing Security

The IP Office has a range of security features. However, for ease of initial IP Office installation the security features are not enabled by default. Therefore, during installation it is necessary to implement the configuration options listed here.

### Minimum Security

A minimum-security scenario is one where any individual with the correct service user name and password can access the configuration from any PC using IP Office Manager. Passwords can be simple and never age.

- Change the default passwords of all service users and the security administrator
- Set the system **Security Administration** service security level to **Secure, Low**.
- Leave the system service user **Password Reject Action** set to **Log to Audit Trail**.
- Leave the system **Client Certificate Checks** level set to **None**.
- Leave the system **Minimum Password Complexity** set to **Low**.
- Leave the system **Previous Password Limit** set to 0.
- Leave the system **Password Change Period** set to 0.

- Leave the system **Account Idle Time** set to 0.
- Leave the **Certificate Check Level** to **Low** in the IP Office Manager preferences.

### Medium Security

A medium-security scenario uses password complexity restrictions. Passwords cannot be simple and will age.

- Change the default passwords of all service users and the security administrator
- Set the system **Security Administration** service security level to **Secure, Medium**.
- Set the system **Configuration** service security level to **Secure, Medium**.
- Leave the system service user **Password Reject Action** set to **Log to Audit Trail**.
- Leave the system **Client Certificate Checks** level set to **None**.
- Set the system **Minimum Password Complexity** to **Medium**.
- Set the system **Previous Password Limit** to a non-zero value.
- Set the system **Password Change Period** to non-zero value.
- Set the system **Account Idle Time** to a non-zero value.
- Disable all the system **Unsecured Interfaces**.
- Leave the **Certificate Check Level** to **Low** in the IP Office Manager preferences.

### Maximum Security

A maximum-security scenario is one where both configuration and security settings are constrained. Certified individuals with the correct service user name and password can access the configuration from specific PC installations of IP Office Manager. Passwords cannot be simple and will age. IP Office Manager can manage specific systems.

- Change the default passwords of all service users and the security administrator
- Set the system **Security Administration** service security level to **Secure, High**.
- Set the system **Configuration** service security level to **Secure, High**.
- Set the system service user **Password Reject Action** to **Log and Disable Account**.
- Set the system **Client Certificate Checks** level to **High**.
- Set the system **Minimum Password Complexity** to **High**.
- Set the system **Minimum Password Length** to greater than 8.
- Set the system **Previous Password Limit** to greater than 5.
- Set the system **Password Change Period** to a non-zero value.
- Set the system **Account Idle Time** to a non-zero value.
- Install 1024-bit+ third-party certificates in all IP Office server certificates, derived from a trusted certificate authority.
- Install the corresponding trusted CA certificate in each of the IP Office Manager PC's Windows certificate stores.
- Install 1024-bit+ third-party certificates in all IP Office Manager Certificate Stores.

- Install the corresponding certificates in all the system Certificate Stores of all permissible Manager entities, and the trusted CA certificate.
- Disable all the system **Unsecured Interfaces**.
- Set the **Manager Certificate Checks** level to **High** in the IP Office Manager preferences.
- Set the certificate offered to the system in the IP Office Manager preferences.

The above essentially locks the IP Office and corresponding IP Office Manager together. Only recognized (by strong certificate) entities can communicate successfully on the service interfaces. All services use strong encryption and message authentication.

The use of intermediate CA certificates can overcome the limit of 6 certificates in each system IP Office certificate store.

## SRTP

Secure Real-Time Transport Protocol (SRTP) refers to the application of additional encryption and or authentication to VoIP calls (SIP and H.323). The IP Office can apply SRTP to calls between phones, between ends of an IP trunk or in various other combinations.

IP Office supports:

- Individual configuration for RTP and RTCP authentication and encryption.
- HMAC SHA1 as the authentication algorithm.
- AES-CM as the encryption algorithm.
- 80-bit or 32-bit authentication tag.
- Key length of 128-bits.
- Salt length of 112-bits.

You can configure the use of SRTP at the system level. The options are **Best Effort** or **Enforced**. The recommended setting is **Best Effort**. In that scenario, the IP Office uses SRTP if supported by the other end. When using **Enforced**, the IP Office does not allow the call if the other end does not support SRTP.

You can set different SRTP settings for individual trunks and extensions if necessary. The IP Office supports SRTP on SIP Lines, SM Lines, and IP Office Lines.

### Encrypted RTCP

The IP Office supports unencrypted RTCP by default. You can configure encrypted RTCP when required.

For SRTP calls where one end is using encrypted RTCP and the other is unencrypted, the call cannot use direct media. Instead, the IP Office provides SRTP relay for the call.

## Authentication

The IP Office supports applying authentication to the voice (RTP) and or control signal (RTCP) parts of a call. The IP Office applies authentication after applying encryption. That allows authentication at the remote end before needing to decrypt.

- For the initial exchange of authentication keys during call setup, the IP Office uses SDESC for SIP calls and H235.8 for H.323 calls.
- The IP Office only supports SRTP when using an addition method such as TLS or a VPN tunnel to establish a secure data path before call setup.
- A replay attack is when someone intercepts packets and then attempts to use them to for a denial-of-service or to gain unauthorized access. Replay protection records the sequence of packets received. All RTP and RTCP packets in the call stream have a sequential index number. However, the packets can arrive in non- sequential order.

The IP Office protects against replay attacks by using a moving replay window containing the index numbers of the last 64-authenticated packets received or expected. Using this

- The IP Office only accepts packets that have an index ahead of or inside the replay window.

The IP Office rejects previously received packets.

- Rekeying is the sending of new authentication keys at intervals during a secure call. The IP Office does not support rekeying, it sends authentication keys at the start of the call.

## Emergency Calls

The IP Office allows emergency calls from an extension regardless of the SRTP requirements and support.

## SRTP Indication

SRTP call indication depends on the model of phone. The System Status Application and SysMonitor applications can display details of SRTP calls.

## General

### Security > Security Settings > General

#### Security Administrator

The security administrator is a special account that cannot be deleted or disabled. It can be used to access the system's security settings but cannot access the system's configuration settings.

| Field                                | Description                                                                                                                                                                                                                                                     |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Unique Security Administrator</b> | Default = Off<br><br>This setting is no longer used. It is greyed out and set to off, meaning that permission to access and change security settings can also be assigned to other service user accounts through their rights groups memberships.               |
| <b>Name</b>                          | Default = 'security'. Range = 6 to 31 characters.<br><br>The name for the security administrator.                                                                                                                                                               |
| <b>Change Password</b>               | Range = 9 to 31 characters.<br><br>The password for the security administrator. In order to change the security administrator password, the current password must be known. The user's original password is set during the initial configuration of the system. |

| Field                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Minimum Password Complexity</b>       | <p>Default = Medium.</p> <p>The password complexity requirements. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Low</b> - Any password characters may be used without constraint. Password must not contain your user name.</li> <li>• <b>Medium</b> - The password must include characters from at least 2 of the character sets listed below. For example a mix of lower case and upper case. In addition, 3 or more consecutive identical characters of any type is not allowed. <ul style="list-style-type: none"> <li>- Lower case alphabetic characters.</li> <li>- Upper case alphabetical character.</li> <li>- Numeric characters.</li> <li>- Non-alphanumeric characters, for example # or *.</li> </ul> </li> <li>• <b>High</b> - As per medium but requiring characters from at least of the 3 character sets above.</li> </ul> |
| <b>Previous Password Limit (Entries)</b> | <p>Default = 24. Range = 0 (Off) to 24 records.</p> <p>The number of previous password to check for duplicates against when changing the password. When set to <b>0</b>, no checking of previous passwords takes place. This setting is active for attempted password changes on both Security Manager and the system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### Phone Registration

| Field                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Block Default IP Phone Passcodes</b> | <p>Default = On</p> <p>If selected, existing IP phone registrations with default passcodes are not allowed in the system. Administrators must type in passwords for registering the existing phones. If not checked, existing IP phone registrations with default passcodes are allowed for registration with the system. Allowing existing phones to register with default passcodes pose a security risk as outsiders can access the system using those passcodes.</p> |

### Service User Details

These settings control service user names and password/account policies. This setting is active for attempted password changes on all administration interfaces.

| Field                                    | Description                                                                                                                                                                                  |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Minimum Name Length</b>               | <p>Default = 6, Range 1 to 31 characters.</p> <p>This field sets the minimum name length for service user names.</p>                                                                         |
| <b>Minimum Password Length</b>           | <p>Default = 9, Range 1 to 31 characters.</p> <p>This field sets the minimum password length for service user passwords.</p>                                                                 |
| <b>Password Reject Limits (Attempts)</b> | <p>Default = 3, Range 0 (Off) to 255.</p> <p>Sets how many times an invalid name or password is allowed within a 10 minute period before the <b>Password Reject Action</b> is performed.</p> |

*Table continues...*

**Base Configuration**

| Field                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Services Base TCP Port</b> | <p>Default = 50804. Range = 49152 to 65526.</p> <p>This is the base TCP port for services provided by the IP Office. It sets the ports on which the IP Office listens for requests to access those services, using its LAN1 IP address. Each service uses a port offset from the base port value.</p> <ul style="list-style-type: none"> <li>• If this value is changed from its default, the IP Office Manager application must be set value through its <b>File &gt; Preferences &gt; Preferences &gt; Services Base TCP Port</b> setting.</li> <li>• For information on IP Office port used, see the <i>Using IP Office System Monitor</i> manual.</li> </ul> |
| <b>Maximum Service Users</b>  | <p>Default = 64.</p> <p>This is a fixed value for information only. The maximum number of service users that you can configure in the IP Office system's security settings</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Maximum Rights Groups</b>  | <p>Default = 32.</p> <p>This is a fixed value for information only. The maximum number of rights groups that you can configure in the IP Office system's security settings.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### System Discovery

System discovery is the processes used by applications to locate and list available systems. If required, you can disable the IP Office from responding to this process. If you do that, access to the IP Office requires its specific IP address.

| Field                       | Description                                                                                     |
|-----------------------------|-------------------------------------------------------------------------------------------------|
| <b>TCP Discovery Active</b> | <p>Default = On.</p> <p>If enabled, the IP Office responds to TCP discovery requests.</p>       |
| <b>UDP Discovery Active</b> | <p>Default = On.</p> <p>If enabled, the IP Office responds to UDP discovery those requests.</p> |

### Security

These settings cover the per-system security aspects, primarily TLS settings.

| Field                               | Description                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Security Session ID Cache</b>    | <p>Default = 10 hours, Range 0 to 100 hours.</p> <p>This sets how long the IP Office system retains TLS session IDs. If retained, the session ID may be used to quickly restart TLS communications between the system and a re-connecting application. When set to 0, no caching takes place and each TLS connection is renegotiated.</p> |
| <b>HTTP Challenge Timeout (sec)</b> | <p>Default = 10.</p> <p>For HTTP/HTTPS connection attempts, this field sets the timeout for connection validation responses.</p>                                                                                                                                                                                                          |

*Table continues...*

| Field                               | Description                                                                                                  |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>RFC2617 Session Cache (mins)</b> | Default = 10.<br>For HTTP/HTTPS sessions, this field sets the duration for successful logins as per RFC2617. |
| <b>Minimum Protocol Version</b>     | Default = TLS 1.2<br>This sets the minimum TLS protocol version for TLS connections.                         |

### HTTP Ports

These settings set the ports for web-based configuration access to the system.

| Field                    | Description     |
|--------------------------|-----------------|
| <b>HTTP Port</b>         | Default = 80.   |
| <b>HTTPS Port</b>        | Default = 443.  |
| <b>Web Services Port</b> | Default = 8443. |

### Web Socket Proxy

These settings are applicable to WebSocket communication over IP Office lines.

| Field                 | Description                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enabled</b>        | Default = On.<br><ul style="list-style-type: none"><li>When enabled, IP Office Web Manager uses the proxy server to communicate between the Server Edition Primary server and other IP Office nodes.</li><li>When disabled, the WebSocket proxy is disabled. All IP Office line WebSocket communication is closed with 404 <code>NotFound</code>.</li></ul> |
| <b>Enforce Secure</b> | Default = On.<br><ul style="list-style-type: none"><li>When enabled, all proxy communication over IP Office line Websocket uses HTTPS.</li><li>When disabled, all HTTPS IP Office line Websocket communication is closed with 403 <code>Forbidden</code>.</li></ul>                                                                                         |

### Avaya Spaces Keys

| Field                          | Description                                                                                                                                                                            |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Avaya Spaces API Key</b>    | The API key and key secret used for connection between the IP Office and Avaya Cloud Services. For further details, see the <i>IP Office Avaya Workplace Client Installation Notes</i> |
| <b>Avaya Spaces Key Secret</b> |                                                                                                                                                                                        |

## Unsecured Interfaces

Navigation: **Security > Security Settings > System > Unsecured Interfaces**

These features relate to applications that access the system configuration settings using older security methods.

| Field                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System Password</b>              | Range = 0 to 31 characters.<br>The system password is for the following: <ul style="list-style-type: none"> <li>• IP Office Manager access to upgrade IP Office IP500 V2 systems.</li> <li>• UDP/TCP access by SysMonitor if the <b>Monitor Password</b> password is blank.</li> </ul>                                                                                                                                                                   |
| <b>Voicemail Password</b>           | Default = Blank. Range = exactly 31 characters.<br>For IP Office 11.1 FP1 and higher versions, the password for voicemail connection is enforced to 31 characters. <ul style="list-style-type: none"> <li>• This password is also set through the Voicemail Pro client and Web Manager application.</li> <li>• When no password is set, an auto generated password is automatically set on both Voicemail Pro client and Web Manager systems.</li> </ul> |
| <b>Monitor Password</b>             | Default = Blank. Range = 0 to 31 characters.<br>This password is used by SysMonitor for UDP and TCP access. If blank, then SysMonitor uses the <b>System Password</b> .<br>If changing this password with no previous password set, enter the system password as the old password.                                                                                                                                                                       |
| <b>Use Service User Credentials</b> | Default = Off.<br>If enabled, SysMonitor access using UDP or TCP, uses service user names and passwords rather than the <b>Monitor Password</b> . The service user must also be a member of a rights group with <b>System Status &gt; System Monitor - Access</b> enabled.                                                                                                                                                                               |

### Application Controls

These check boxes control which actions the system will support for legacy applications. Different combinations are used by the different applications. A summary of the applications affected by changes is listed in the **Application Support** list.

- For Linux-based IP Office servers, some ports, such as port 69 and 80, are also controlled by the **Solution > ≡ > Platform View > Settings > System > Firewall Settings**.

| Field                      | Description                                                                            |
|----------------------------|----------------------------------------------------------------------------------------|
| <b>TFTP Server</b>         | Default = On.                                                                          |
| <b>TFTP Directory Read</b> | Default = Off.<br>Used by Avaya Wireless DECT for IP Office contacts if using an AIWS. |
| <b>TFTP Voicemail</b>      | Default = Off.                                                                         |
| <b>Program Code</b>        | Default = On.<br>Controls use of the upgrade wizard from within IP Office Manager.     |

*Table continues...*

| Field                       | Description                                                                                                    |
|-----------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>DevLink</b>              | Default = On.<br>Control for DevLink applications, including UDP, TCP and HTTP access by SysMonitor.           |
| <b>TAPI/DevLink3</b>        | Default = Off.<br>Controls support for connections from TAPI and DevLink3 applications.                        |
| <b>HTTP Directory Read</b>  | Default = On.<br>Allows system directory accessed using HTTP rather than HTTPS.                                |
| <b>HTTP Directory Write</b> | Default = On.<br>Allow HTTP rather than HTTPS to import temporary directory records into the system directory. |

## Services

### Navigation: Security > Security Settings > System Services

This tab shows details of the services that the system runs to which service users can communicate.

| Field               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>         | The name of the service. This is a fixed value for information only.                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Host System</b>  | The IP Office system name.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Service Port</b> | This is the port on which the IP Office system listens for attempts to access the service. The routing of traffic to this port must be enabled on firewalls and network devices between the service users and the IP Office system.<br><br>The base port (TCP or HTTP) for each service is offset by a fixed amount from the ports set in System Settings. For information on port usage, see the <i>IP Office Port Matrix</i> document on the Avaya support site. |

| Field                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Service Security Level</b> | <p>Sets the minimum security level the service supports.</p> <ul style="list-style-type: none"> <li>If the IP Office system does not already have an x509 security certificate, selecting a setting other than <b>Unsecure Only</b> will cause the IP Office system to stop responding for up to a minute whilst it generates a self-signed security certificate.</li> </ul> <p>The options are:</p> <ul style="list-style-type: none"> <li><b>Unsecure Only</b> - This option allows only unsecured access to the service. The service's secure TCP port, if any, is disabled. This or disabled are the only options supported for the System Status Interface and Enhanced TSPI services.</li> <li><b>Unsecure + Secure</b> This option allows both unsecured and secure (Low) access. In addition, TLS connections are accepted without encryption, just authentication.</li> <li><b>Secure Low</b> - This option allows secure access to the service using TLS and weak (for example DES_40+MD5) encryption and authentication or higher.</li> <li><b>Secure Medium</b> - This option allows secure access to the service using TLS and moderate (for example SHA-256) encryption and authentication or higher.</li> <li><b>Secure High</b> - This option allows secure access to the service using TLS and strong encryption (for example SHA-256) and authentication, or higher. <ul style="list-style-type: none"> <li>Only supported by Linux-based IP Office systems.</li> <li>A certificate is required from the client. For IP Office Manager, the <b>Certificates &gt; Received certificate checks (Management interfaces)</b> setting sets the certificate checks it uses.</li> </ul> </li> <li><b>Disabled</b> - This option is only available for the System Status Interface and Enhanced TSPI services. If selected, access to the service is disabled.</li> </ul> <p>For details of the ciphers supported by <b>Secure Medium</b> and <b>Secure High</b>, see the <i>Avaya IP Office™ Platform Security Guidelines</i> manual.</p> |
| <b>Service Access Source</b>  | <p>Used for the <b>Configuration</b> service. Sets the supported modes for IP Office Manager access to the IP Officesystem:</p> <ul style="list-style-type: none"> <li><b>Server Edition Manager</b> - If selected, the IP Office system can only be configured using IP Office Manager in its Server Edition mode. This is the default for Server Edition systems. <ul style="list-style-type: none"> <li>Opening the configuration of a Server Edition system in IP Office Manager running in any mode other than Server Edition mode should be avoided unless absolutely necessary for system recovery. Even in that case, IP Office Manager will not allow renumbering, changes to the voicemail type, and changes to H.323 lines.</li> </ul> </li> <li><b>Avaya Aura System Manager</b> - If selected, the IP Office system can only be configured using SMGR in Branch Mode. This is the default for centrally managed systems.</li> <li><b>Unrestricted</b> - The IP Office system can be configured using IP Office Manager in its normal simplified and advanced view modes.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Default Settings

| Name                    | Service Port | Service Security Level | Service Access Source |
|-------------------------|--------------|------------------------|-----------------------|
| Configuration           | 50805        | Secure Medium          | Unrestricted          |
| Security Admin          | 50813        | Secure Medium          | –                     |
| System Status Interface | 50809        | Secure Medium          | –                     |
| Enhanced TSPI Access    | 50814        | Secure Medium          | –                     |
| HTTP                    | 80, 443      | Secure Medium          | –                     |
| Web Services            | 8443         | Secure Medium          | –                     |
| External                | 50821        | Disabled               | –                     |

## Rights Groups

**Navigation:** Security > Security Settings > Rights Groups

A rights group is a set of permissions to access various features and services. The rights groups to which a service user belongs sets what that service user can do. If the service user is a member of several rights groups, they gain the combined permissions of both rights groups.

**Configuration**

This tab sets the configuration settings access for service user's who are members of this Rights Group.

**IP Office Service Rights**

| Field                              |                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------|
| <b>Read All Configuration</b>      | If selected, rights group members can read the system configuration.                              |
| <b>Write All Configuration</b>     | If selected, rights group members can make changes to the system configuration.                   |
| <b>Merge Configuration</b>         | If selected, rights group members can save configuration changes using a merge.                   |
| <b>Default Configuration</b>       | If selected, rights group members can default the system configuration.                           |
| <b>Reboot/Shutdown Immediately</b> | If selected rights group members can reboot and shutdown the system.                              |
| <b>Reboot When Free</b>            | If selected, rights group members can select reboot when free when rebooting the system.          |
| <b>Reboot At Time Of Day</b>       | If selected, rights group members can select reboot at a specific time when rebooting the system. |

**Manager Operator Rights**

This setting controls what types of configuration records Manager will allow members of the Rights Group to viewed and what actions they can perform with those types of records. The **Administrator** and **Manager** rights group members are also able to access embedded file management.

| Role                 | Actions | Configuration Record Types                                                                                                                                            |
|----------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Administrator</b> | All     | View, edit create and delete all configuration records.                                                                                                               |
| <b>Manager</b>       | View    | View all except WAN Port.                                                                                                                                             |
|                      | Edit    | Extension, User, Hunt Group, Short Code, Service, RAS, Incoming Call Route, Directory, Time Profile, Firewall Profile, IP Route, Least Cost Route, Account Code, ARS. |
|                      | New     | As edit except Short Code.                                                                                                                                            |
| <b>Operator</b>      | Delete  | As edit except Short Code.                                                                                                                                            |

## Security Administrator

This tab sets the security settings access for Service user's who are members of this Rights Group. These settings are ignored and greyed out if a Unique Security Administrator has been enabled in General Settings.

| Field                                  | Description                                                                                                                                                                                                                                                                                               |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Read All Security Settings</b>      | Members of the Rights Group can view the system's security settings.                                                                                                                                                                                                                                      |
| <b>Write All Security Settings</b>     | Members of the Rights Group can edit and return changes to the system's security settings.                                                                                                                                                                                                                |
| <b>Reset All Security Settings</b>     | If selected, members of the Rights Group can reset the security settings to default values.                                                                                                                                                                                                               |
| <b>Write Own Service User Password</b> | If selected, members of the Rights Group can change their own password when requested to do so by the system. That request may be the result of the <b>Force new password</b> or <b>Account Password Change Period (days)</b> settings. The new password change is requested automatically at login time. |

## System Status

This tab sets whether members of the group can access the system using the System Status Application (SSA).

| Field                          | Description                                                                                                                                                                                                                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System Status - Access</b>  | If selected, members of the Rights Group can view the system's current status and resources using the System Status Application (SSA).                                                                                                                                                              |
| <b>Read All Configuration</b>  | The System Status application includes tools to take a snapshot of the system for use by Avaya for diagnostics. That snapshot can include a full copy of the system's configuration settings. This setting must be enabled for the SSA user to include a copy of the configuration in the snapshot. |
| <b>System Control</b>          | If enabled, the SSA user is able to use SSA to initiate system shutdowns and memory card shutdown/restarts.                                                                                                                                                                                         |
| <b>System Monitor - Access</b> | If enabled, members of the Rights Group can use the System Monitor application to perform detailed diagnosis of system problems.                                                                                                                                                                    |

### IP Office Service Rights

These settings are used by users in rights groups for external components using web services to configure and manage the system.

| Field                               | Description                                                                                                                                                   |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Voicemail Pro Basic</b>          | If selected, the rights group members can read the configuration and perform backup, restore, and upgrade.                                                    |
| <b>Voicemail Pro Standard</b>       | If selected, the rights group members can update the configuration and perform backup, restore, and upgrade.                                                  |
| <b>Voicemail Pro Administrator</b>  | If selected, the rights group members can update the configuration and security settings.                                                                     |
| <b>one-X Portal Administrator</b>   | If selected, the rights group members can update the configuration and security settings. Does not include backup and restore.                                |
| <b>one-X Portal Super User</b>      | If selected, the rights group members can perform backup and restore.                                                                                         |
| <b>Web Control Administrator</b>    | If selected, the rights group members can update the configuration settings.                                                                                  |
| <b>Web Control Security</b>         | If selected, the rights group members can update the security settings.                                                                                       |
| <b>WebRTC Gateway Administrator</b> | If selected, the rights group members can update the configuration settings.                                                                                  |
| <b>Management API Read</b>          | If selected, support the use of the management API to access system configuration settings.                                                                   |
| <b>Management API Write</b>         | If selected, support the use of the management API to change system configuration settings.                                                                   |
| <b>Media Manager Administrator</b>  | If selected, the rights group members can update Media Manager configurations and settings. The rights group members can also access all archived recordings. |
| <b>Media Manager Standard</b>       | If selected, the rights group members can have read-only access to Media Manager configurations and access to the recordings.                                 |

*Table continues...*

| Field                            | Description                                                                                                                                                                                                                                     |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reporter Administrator</b>    | If selected, the rights group members can have configuration access to Integrated Contact Reporter.                                                                                                                                             |
| <b>one-X CTI API</b>             | If selected, support use of one-X CTI API commands.                                                                                                                                                                                             |
| <b>Adjunct Server Connection</b> | Used to support a websocket connection between an IP Office system and an IP Office application server supporting that system.                                                                                                                  |
| <b>TURN Server Connection</b>    | Allow the name and password details of the rights group's associated service user to be sent to IP Office User Portal sessions. They then use those details to connect to the TURN server specified in <b>System   LAN   Network Topology</b> . |

## Certificates

### Navigation: Security > Security Settings > Certificates

Services between the system and applications can, depending on the settings of the service being used for the connection, require the exchange of security certificates. The system can either generate self-signed certificate or use certificates from a trusted source can be loaded.

#### Identity Certificate

These settings relate to the X.509v3 certificate that the system uses to identify itself when connecting another device using TLS. For example, a PC running IP Office Manager set to **Secure Communications**.

The system's certificate is advertised (used) by services which have their **Service Security Level** set to a value other than **Unsecure Only**.

By default, each IP Office server provides a self-generated certificate, generated when the system is first installed. However, the certificate can also come from other sources:

- An alternate identity certificate for the system from added using the **Set** button.
  - For secondary, expansion and application servers, this can be an identity certificate generated for that server from the web control menus of the primary server.
- For subscription mode systems, **Automatic Certificate Management** can be selected. COM then automatically provides the system with an appropriate identity certificate and certificate updates.

| Field                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Offer Certificate</b>               | Default = On.<br><br>This is a fixed value for indication purposes only. This sets whether the system will offer a certificate in the TLS exchange.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Offer ID Certificate Chain</b>      | Default = On<br><br>When enabled, the IP Office advertises a chain of certificates during TLS session establishment. <ul style="list-style-type: none"> <li>• The chain of certificates starts with the system's identity certificate</li> <li>• It then adds any certificates it finds in its trusted certificate store with the same Common Name in their "Issued By" Subject Distinguished Name field.</li> <li>• If the Root CA certificate is found in the trusted certificate store, that is also included in the certificate chain.</li> <li>• A maximum of six certificates are supported in the certificate chain.</li> </ul> |
| <b>Issued To</b>                       | Default = IP Office identity certificate.<br><br>For information only. The common name of certificate issuer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Certificate Expiry Warning Days</b> | Default = 60, Range = 30 to 180<br><br>IP Office Manager can display a warning when a system's security certificate is due to expire. This setting is used to set the trigger for certificate warnings.                                                                                                                                                                                                                                                                                                                                                                                                                                |

The following settings are only shown for subscription mode systems. They allow COM to provide the system with its identity certificate and to automatically update the certificate when required.

| Field                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Automatic Certificate Management</b> | <p>Default = Disabled</p> <p>Supported for subscription mode systems only. When enabled, the system uses an identity certificate supplied by COM along with a copy of the COM root certificate. The maintenance and renewal of the identity certificate and its trust chain are performed automatically.</p>                                                                                                                                                                                                                                                                                                                                               |
| <b>SAN Details Origin</b>               | <p>If the identity certificate issued to the system by COM needs to include any location specific subject alternate name values, this field can be used to define those values.</p> <ul style="list-style-type: none"> <li>• <b>Migrate from existing ID certificate</b> - When generating a new certificate for the system, use the SAN details from its existing identity certificate.</li> <li>• <b>Generate form current LAN configuration</b> - When generating a new certificate, create the SAN details from the system's existing LAN and SIP settings.</li> </ul>                                                                                 |
| <b>Automatic Phone Provisioning</b>     | <p>Default = Enabled</p> <p>This additional option is supported when using <b>Automatic Certificate Management</b>. When enabled, phone certificates on phones that support certificate download, are automatically updated when the system identity certificate is updated.</p> <ul style="list-style-type: none"> <li>• New and default phones obtain the certificate using the normal trust on first use process.</li> <li>• When an update occurs, the <code>46xxsettings.txt</code> file is updated to includes details of both certificates. Following a restart, the phones fetch the new certificate using the old certificate details.</li> </ul> |

The following settings can be used to manage the current identity certificate.

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Set</b>  | <p>Using <b>Set</b> allows you to load an identity certificate and its associated private key.</p> <ul style="list-style-type: none"> <li>• This control is not shown for subscription mode systems using <b>Automatic Certificate Management</b>.</li> </ul> <p>The IP Office supports:</p> <ul style="list-style-type: none"> <li>• 1024, 2048 and 4096 bit RSA keys. Use of 4096 RSA keys may impact system performance.</li> <li>• SHA-1, SHA-256, SHA-384, and SHA-512 signature algorithms. Using signature size larger than SHA-256 may impact system performance.</li> </ul> <p>The source may be:</p> <ul style="list-style-type: none"> <li>• Current User Certificate Store.</li> <li>• Local Machine Certificate Store.</li> <li>• File in the PKCS#12 format.</li> <li>- Pasted from clipboard in PEM format, including header and footer text. This method must be used for PEM (.cer) and password protected PEM (.cer) files. The identity certificate requires both the certificate and private key. The CER format does not contain the private key. For these file types, select <b>Paste from clipboard</b> and then copy the certificate text and private key text into the Certificate Text Capture window.</li> </ul> <p><b>Using a file as the certificate source:</b></p> <p>In Manager, when using the file option, the imported file (.p12, .pfx or .cer) can only contain the private key and identity certificate data. It cannot contain additional Intermediate CA certificates or the Root CA certificate. The Intermediate CA certificates or the Root CA certificate must be imported separately into the IP Office Trusted Certificate Store. This does not apply to Web Manager.</p> <p> <b>Note:</b></p> <p>Web Manager does not accept the file of type CER with extension .cer. That file type can only be used in Manager.</p> |
| <b>View</b> | <p>Displays details of the current identity certificate. The certificate view menu can also be used to install the certificate (but not its private key) into the viewing PCs local certificate store. This can be used by the PC for secure connection to the system or to export the certificate from the PC.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Regenerate</b> | <p>This command generates a new identity certificate:</p> <ul style="list-style-type: none"> <li>For system's using the system's own self-generated self-signed identity certificate, this command generates a replacement for the current identity certificate.</li> <li>For subscription mode system's, this command requests a replacement identity certificate from COM. Alternatively, it can be used to request an identity certificate for another server.</li> </ul> <p><b>! Important:</b></p> <ul style="list-style-type: none"> <li>Regeneration takes up to a minute, during which time system performance is impacted. Therefore, only perform this action during a maintenance window. The regeneration takes places after saving the security settings.</li> </ul> <p>When clicked, the <b>Regenerate Certificate</b> window prompts you to enter the values in the following table.</p> |

| Setting                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Signature</b>                   | <p>Default = SHA256/RSA2048.</p> <p>Select the signature algorithm and the RSA key length to use for the new self-signed identity certificate. The options are SHA256/RSA2048 or SHA1/RSA1024.</p>                                                                                                                                                                                                                                                                                                                   |
| <b>Subject Name</b>                | <p>Default = None</p> <p>Specifies the common name for the subject of this certificate. The subject is the end-entity or system that owns the certificate (public key). Example: <code>ipoffice-0123456789AB.avaya.com</code>. If left blank, a system generated subject name is used.</p>                                                                                                                                                                                                                           |
| <b>Subject Alternative Name(s)</b> | <p>Default = None</p> <p>Specify any Subject Alternative Name (SAN) values to include in the certificate.</p> <ul style="list-style-type: none"> <li>Each entry consists of a prefix, followed by the colon and then the value. Supported prefixes are DNS, URI, IP, SRV and email.</li> <li>Multiple entries can be added, each separated by the comma. The input field has a maximum size limit of 511 characters.</li> <li>Example: <code>DNS:192.168.0.180,IP:192.168.0.18,URI:SIP:example.com</code></li> </ul> |
| <b>For Different Machine</b>       | <p>Default = Off</p> <p>This option is only shown for subscription mode systems using <b>Automatic Certificate Management</b>.</p> <p>When selected, the address details of the other server and the duration of the certificate (maximum 825 days) are requested. After generating the certificate, the browser automatically downloads the certificate file.</p>                                                                                                                                                   |

### Trusted Certificate Store

This section displays a list of the certificates held in the system's trusted certificate store and allows management those certificates. Up to 25 X.509v3 certificates can be placed into the store.

When adding a certificate, the source can be:

- Current User Certificate Store.
- Local Machine Certificate Store.
- A file in one of the following formats:
  - PEM (.cer)
  - password protected PEM (.cer)
  - DER (.cer)
  - password protected DER (.cer)
- Pasted from clipboard in PEM format, including header and footer text.

This method must be used for PKCS#12 (.pfx) files. Select **Paste from clipboard** and then copy the certificate text into the **Certificate Text Capture** window.

### Certificate Checks

| Field                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Certificate Expiry Warning Days</b>             | <p>Default = 60. Range = 30 to 180 days.</p> <p>Set the number of days before the expiry of any stored certificate, at which IP Office Manager, IP Office Web Manager, and System Status Application will display warnings</p>                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Use different certificate for SIP telephony</b> | <p>Default = None</p> <p>The possible settings are <b>None</b>, <b>SIP Trunks</b> or <b>SIP &amp; SM Trunks</b>, <b>SIP Phones</b>.</p> <ul style="list-style-type: none"> <li>• When set to <b>None</b>, all secure telephony communications use the system's default identity certificate and settings.</li> <li>• When set to any other option, an extra set of options similar to those shown for <b>Identity Certificate</b> section are displayed. These can be used to define the certificate used for secure telephony communications. The certificate to use is uploaded to the system's certificate store using the <b>Set</b> button.</li> </ul> |

## SCEP Settings

These settings are used for branch system's which are under centralized management through SMGR.

Simple Certificate Enrollment Protocol (SCEP) is a protocol intended to ease the issuing of certificates in a network where numerous devices are using certificates. Rather than having to individually administer the certificate being used by each device, the devices can be configured to request a certificate using SCEP.

These settings are normally set during the systems initial configuration.

| Field                       | Description                                         |
|-----------------------------|-----------------------------------------------------|
| Active                      | Default = Off.                                      |
| Request Interval (sec)      | Default = 120 seconds. Range = 5 to 3600 seconds.   |
| SCEP Server IP Address/Name | Default = Blank.                                    |
| SCEP Server Port            | Default = 80 for HTTP and 443 for HTTPS.            |
| SCEP URI                    | Default = /ejbca/publicweb/apply/scep/pkiclient.exe |
| SCEP Password               | Default = Blank.                                    |

# Part 6: The Applications Menu

## Applications menu options

### Solution > Applications

This menu is used to access various other applications or the settings for those applications.

| Application                           | Server Edition | IP500 V2 | Application Server | UCM |
|---------------------------------------|----------------|----------|--------------------|-----|
| File Manager                          | Yes            | Yes      | Yes                | Yes |
| IP Office Manager                     | Yes            | –        | Yes                | Yes |
| one-X Portal                          | Yes            | –        | Yes                | Yes |
| Voicemail Pro - System Preferences    | Yes            | –        | Yes                | Yes |
| Voicemail Pro - Call Flow Management  | Yes            | –        | Yes                | Yes |
| WebRTC Configuration                  | Yes            | –        | Yes                |     |
| Media Manager                         | Yes            | –        | Yes                | –   |
| Centralized Media Manager Audit Trail | Yes            | Yes      | Yes                | –   |

# Chapter 41: File Manager

## Solution > Applications > File Manager

This menu allows access to some of the folders on the server. It is intended for:

- Upload and download of files to and from the /system/primary folder used by the telephony service.
- Management of the custom prompts folder used by the voicemail service.

|   |                                                                                        |
|---|----------------------------------------------------------------------------------------|
| 1 | Graphic representation of disk capacity for the currently selected system.             |
| 2 | Click to load a server into the File Manager.                                          |
| 3 | The system folder directory. Select a folder to display the contents in the file list. |
| 4 | File search tool.                                                                      |
| 5 | File management tool bar. Select a file in the file list to enable the tools.          |
| 6 | File list.                                                                             |

# Chapter 42: IP Office Manager

## Solution > Applications > IP Office Manager

This command launches a locally installed instance of the IP Office Manager application and then automatically loads the IP Office service configuration file from the server. For details of using IP Office Manager, refer to *Administering Avaya IP Office™ Platform with Manager*.

**\* Note:**

- In order to open a client application (for example IP Office Manager), you must log into IP Office Web Manager using the IP Office LAN 1 IP address.

**\* Note:**

- This option is not supported by current browsers. The option is not available in later versions of IP Office Web Manager.

This action requires the IP Office service user account using IP Office Web Manager to have sufficient rights and to be shared on all the IP Office servers.

## Manager software version

When used, the command checks whether IP Office Manager is already installed, and if so, the version of the application.

| Scenario                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Manager version is current       | If the Manager version is current, Manager launches without a login prompt and loads the configuration file for the server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Manager version is not current   | If the Manager version is not current, you are prompted to download and install the latest version and a link is provided. You can continue to use the currently installed version or download the current version. Upgrading to the current version requires a browser restart.                                                                                                                                                                                                                                                                                                                                                 |
| <b>Manager is not installed:</b> | <p>If Manager is not installed, you are prompted to download and install the latest version and a link is provided. Once Manager is installed, a browser restart is required before launching Manager.</p> <ul style="list-style-type: none"><li>• Note that the version of IP Office Manager installed is not the full version. It runs in English only and does not include the files needed for actions such as IP500 V2 system upgrades, phone firmware support, SD card recreation, etc. The full administration suite installer can be downloaded from <a href="http://support.avaya.com">support.avaya.com</a>.</li></ul> |

## **Synchronizing Server Edition passwords**

In order to open IP Office Manager for a Server Edition solution, all IP Office systems in the solution must have a service user with common credentials. See [Synchronize Service User and System Password](#) on page 110.

# Chapter 43: one-X Portal

## Navigation: Solution > Applications > one-X Portal

Select **one-X Portal** to launch a administration menus of the one-X Portal service if that service is running on the server. For details of using the portal administrator menus, refer to *Administering Avaya one-X Portal for IP Office*.

### **Note:**

- In order to open a client application (for example IP Office Manager), you must log into IP Office Web Manager using the IP Office LAN 1 IP address.

# Chapter 44: Voicemail Pro - System Preferences

**Navigation: Solution > Applications > Voicemail Pro - System Preferences**

This menu provides access to the system preferences of the voicemail service running on the server.

|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System Fax Number</b>                     | Default = Blank<br><br>Use this field to set the number of the fax machine to which all incoming faxes are to be directed. If you are using a fax board, the number that you enter must match the extension number that is connected to the fax board of the fax server computer.                                                                                                                                                                                                                                                                                                                                         |
| <b>Use as a Prefix</b>                       | If your fax system does not use prefix addressing, leave this box unchecked. For this feature to work, you also need to set up a short code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Enable Fax Sub-Addressing</b>             | Most fax servers perform fax forwarding based on DTMF signaling received with the fax call. Select the Enable Fax Sub-Addressing check box so that the DTMF signal is passed to the fax server after the call has been answered so that the fax can be forwarded to the e-mail address of the intended recipient.                                                                                                                                                                                                                                                                                                         |
| <b>Archive Solution</b>                      | Sets how the voicemail server should treat call recordings when VRL is selected as the recording destination: <ul style="list-style-type: none"> <li>• <b>Media Manager:</b> Save the recordings in .opus format for collection by the system's VRL application, for example Media Manager. <ul style="list-style-type: none"> <li>- When using this format, all recordings are authenticated. That is, the <b>VRL</b> and <b>VRLA</b> methods of recording are the same.</li> </ul> </li> <li>• <b>External:</b> Save the recordings in .wav format for collection by a 3rd-party call archiving application.</li> </ul> |
| <b>Enable Voicemail Pro Client Interface</b> | Default = Yes.<br><br>Used to manage communication between the Voicemail Pro server and the client.<br><br>When set to No, Voicemail Pro clients cannot connect to this Voicemail Pro server. When set to Yes, communication between the server and clients is allowed.                                                                                                                                                                                                                                                                                                                                                   |
| <b>Minimum Protocol Version</b>              | Sets the minimum TLS protocol used for TLS links to the voicemail server. The options are TLS 1.0 or TLS 1.2. Note that changes to this setting require the voicemail service to be restarted to take effect.                                                                                                                                                                                                                                                                                                                                                                                                             |

## \* Note:

If you are using Voicemail Pro in a distributed environment, a distributed server delivers a recorded message to the central Voicemail Pro server on completion of the recording. However, the presentation to the Voicemail Pro server for message waiting indication (MWI) and access via telephone might be delayed because of the internal processing of the message and the network latency. The delay might be up to 2 minutes in high traffic situations.

| <b>SMTP Sender</b><br>These settings are used to configure the SMTP server and the server account that Voicemail Pro server uses for sending e-mails through SMTP.<br>Multiple servers can be configured. The first entry specifies the default SMTP server used for sending e-mails if there is no other entry matching the domain specified in the e-mail destination address. Additional servers can be added when different settings are required for sending e-mails to specific domains. For example, the default can be configured for the customer's internal network exchange server with additional entries added for e-mails to external e-mail domain addresses such as yahoo.com.<br>VPNM, distributed Voicemail Pro servers, and primary/backup Voicemail Pro servers all use SMTP to exchange information and messages between Voicemail Pro servers. When that is the case, the first entry in the SMTP Sender list must be the one used and needs to be configured for that service with the domain and server setting both matching the IP address or fully-qualified domain of the Voicemail Pro server. |                                                                                                                                                                                                                                                                                                                                                                                                                                  |

For information on SMTP logging see <i>Avaya IP Office Platform Voicemail Pro Administration</i> .                                                                                                                                                                                                                                                                           |
| <b>Add SMTP Sender</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Click to open the SMTP Sender Configuration window.                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Test Connection</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Click to validate the SMTP configuration. When clicked, Voicemail Pro serves the SMTP server test connectivity request based on the input provided in the SMTP Sender Configuration window and provides a success or failure response. You must fill up all the four fields to test the connection. However, Voicemail Pro uses the values provided in the <b>Mail Server</b> and <b>Port</b> fields to validate the connection. |

| Field              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mail Domain</b> | <p>Default = Blank.</p> <p>This field is used differently depending on whether it is the first entry in the list or not.</p> <p><b>First server entry in the list:</b></p> <p>This is the default outgoing e-mail setting. It also sets the mail destination domain on which the Voicemail Pro server filters incoming messages (see below) and so is repeated in the SMTP Receiver settings.</p> <p>For messaging between Voicemail Pro servers, the first entry in the SMTP Sender list must be the one configured and used. Each server uses the SMTP server service on the same server computer as the voicemail service. For example a Windows-based server uses the SMTP e-mail provided by the IIS on the same server. The voicemail service also uses the domain set to filter incoming SMTP mails received by the SMTP server. For this to work, the domain entered should be the fully-qualified name of the server on which the Voicemail Pro server is running, for example vmpro1.example.com. Any incoming messages where the recipient mail domain is not exactly the same as the specified domain are ignored. The recipient can either be vmsyncmaster, vmsyncslave, or the name or extension of a mailbox on the Voicemail Pro server, for example Extn201@vmprocentral.example.com or 201@vmprocentral.example.com.</p> <p><b>Subsequent entries:</b></p> <p>The domain specifies that these settings should be used for e-mails sent to the matching domain. The entry must be a fully-qualified name resolvable by DNS or an IP address.</p> |
| <b>Mail Server</b> | <p>Default = Blank.</p> <p>Specifies the IP address or fully-qualified domain name of the SMTP server to which messages are sent. Voicemail Pro supports SMTP communication over both - SSL/TLS and plain text.</p> <p><b>First server entry in the list:</b></p> <p>Where messaging between Voicemail Pro servers is being used (central, backup and or distributed servers), the first entry is used and will match the domain set above.</p> <p><b>Subsequent entries:</b></p> <p>It will be the address of the e-mail server that will handle e-mails for recipients other than another Voicemail Pro server on the network.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Port</b>        | <p>Default = Blank.</p> <p>The port number on the SMTP server to which the messages are sent. Port number for an external SMTP server can be different depending on whether you want to send the messages in secure mode or non-secure</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Housekeeping

Navigation: **Applications > Voicemail Pro - System Preferences > Housekeeping**

Use the Housekeeping settings to:

- Set the duration after which the Voicemail Pro server deletes messages and recordings automatically.
- Set the default playback order of messages. Playback can be set to **Oldest First** or **Newest First**.

### Note:

The housekeeping deletion settings do not apply to the messages forwarded to an Exchange server. The messages that are forwarded to an Exchange server are deleted from the Voicemail Pro server in accordance with the **Deleted messages** settings.

| Field                    | Description                                                                                                                                       |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>New Messages</b>      | This status is applied to messages where neither the header nor the message content has been played.                                              |
| <b>Old Messages</b>      | This status is applied to messages where the user has played the message content but has not marked the message as saved.                         |
| <b>Saved Messages</b>    | This status is applied to messages that have been marked as saved by the user.                                                                    |
| <b>Unopened Messages</b> | This status is used for messages where, in Intuity emulation mode, the user has played the message header but has not played the message content. |
| <b>New Recordings</b>    | This status is used for recordings that have not been played.                                                                                     |

## SNMP Alarm

Navigation: **Applications > Voicemail Pro - System Preferences > SNMP Alarm**

IP Office can be configured to generate alarms. These alarms can be sent using SNMP, SMTP e-mail, or Syslog alarm formats. These settings are used to set the levels at which the Voicemail Pro server will indicate to the IP Office to send an alarm.

| Field                       | Description                                                                                                                                                                                                                          |

## Voicemail Recording

Navigation: **Applications > Voicemail Pro - System Preferences > Voicemail Recording**

Use the Voicemail Recording page to configure an SFTP connection on a Linux-based Voicemail Pro server to transfer call recordings to the Voice Recording Library (VRL) application Avaya IP Office ContactStore .

Before you configure the Voicemail Recording settings, you must have configure an SFTP server running on the computer that runs the ContactStore application. For details on the SFTP server requirements.

| Field                      | Description                                     |
|----------------------------|-------------------------------------------------|
| <b>FTP User Name</b>       | The user name used to log in to the FTP server. |
| <b>FTP Password</b>        | The password used to log in to the FTP server.  |
| <b>Remote FTP Location</b> | <IP address>?                                   |
| <b>Remote FTP Host</b>     | The FTP server host name.                       |
| <b>Test Connection</b>     | Click to test the connection.                   |

## Alarms

Navigation: **Applications > Voicemail Pro - System Preferences > Alarms**

The Voicemail Pro client can display the alarm calls that have been configured for the Voicemail Pro to perform.

The Voicemail Pro is limited to 2 outgoing alarm calls at the same time (subject to voicemail port availability). Any additional alarm calls are delayed until the existing alarm calls have been completed.

| Field            | Description                                                                                                                                                                                                                                                                                                 |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Add Alarm</b> | Click to configure the following alarm settings.                                                                                                                                                                                                                                                            |
| <b>Target</b>    |                                                                                                                                                                                                                                                                                                             |
| <b>Time</b>      | Default = 00:00.<br>Set the alarm time in 24-hour format (hh:mm or hhmm). A time value can be entered or a call variable can be used. If left blank or if the call variable used is not a valid time value, the call flow user will be asked to enter a time the same as if <b>Ask Caller</b> was selected. |

# Chapter 45: Voicemail Pro - Call Flow Management

## Solution > Applications > Voicemail Pro - Call Flow Management

This option displays a menu to download the voicemail call flow for local editing and to upload the edited call flow.

| Option                                                   | Description                                                                                                    |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Download Voicemail Pro Offline Configuration File</b> | This option downloads the voicemail server's call flow. It can then be edited and uploaded back to the system. |
| <b>Upload Voicemail Pro Offline Configuration File</b>   | This option uploads an edited offline call flow back to the server.                                            |

- For further details, refer to *Administering IP Office Voicemail Pro*.
- To download and install the Voicemail Pro client, select **Solution > ≡ > Platform View > AppCenter**.

# Chapter 46: WebRTC Configuration

## Solution > Applications > WebRTC Configuration

These menus are supported on the same server as the Avaya one-X® Portal for IP Office service. The settings are used by the **WebRTC Gateway** services. For details, refer to *Deploying IP Office Server Edition*.

The **WebRTC Gateway** service is used for WebRTC clients connecting through Avaya one-X® Portal for IP Office. For example:

- The Avaya one-X® Portal for IP Office Chrome browser client.
- The Avaya Calling Chrome browser extension for Avaya Calling.

### \* Note:

- IP Office User Portal uses the separate WebRTC gateway provided by the IP Office service rather than Avaya one-X® Portal for IP Office. Refer to the **System Settings > System > LAN1 > Network Topology** menu settings. See [Network Topology](#) on page 498.

| <b>Gateway Listen Port</b>   | Default = 42004.<br>The local listen port used by the WebRTC Gateway to accept SIP connections.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>SIP Trunk Listen Port</b> | Default = 42008.<br>Local listen port used by WebRTC Gateway to accept SIP trunk connections.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Logging Level</b>         | Default = Info.<br>Available log levels for the WebRTC Gateway. Changing the log level causes the WebRTC Gateway to restart.<br>The options are <ul style="list-style-type: none"> <li>• <b>Error</b></li> <li>• <b>Warn</b></li> <li>• <b>Info</b></li> <li>• <b>Debug</b></li> <li>• <b>Trace</b></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Allow Origins</b>         | Default = *<br>Type the Domain names and IP addresses you want IP Office to accept connections from. If there are more than one entry, separate the entries by a semicolon (;). These Domain names and IP addresses are added to the WebRTC Gateway's CORS filter. WebRTC Gateway accepts WebSocket connections only from the Domain names and IP addresses whitelisted in the field. The Gateway maintains a list of Domain names and IP addresses to comply with Cross-Origin Resource Sharing (CORS) that enables cross-domain requests from Web browsers to servers and Web APIs. The * in this field allows connections from all Domains and IP addresses including Chrome extensions.<br>Example: "203.0.113.56"; "203.0.113.57"; "*.example.com"<br>If the above values entered in the field, connections from the IP addresses 203.0.113.56, 203.0.113.57, and any domains ending with example.com is allowed. |

# Chapter 47: Web License Manager

## **Navigation: Solution > Applications > Web License Manager**

On systems using PLDS licensing, this option opens the admin menus for the WebLM service running on the server.

### **Login Credentials**

WebLM credentials are managed separately from IP Office system passwords and are not part of single sign on. You must change the default password for the admin user after the first login. The default credentials are:

- User ID: admin
- Password: weblmadmin

# Chapter 48: Media Manager

## Solution > Applications > Media Manager

This set of menus are shown if the server is running the Media Manager service for the archiving of call recordings. That option is supported on the Server Edition primary server and on IP Office Application servers. Refer to *Administering Avaya IP Office™ Platform Media Manager*.

- Systems running in subscription mode can use either Media Manager or Centralized Media Manager as their service for archiving call recordings.

For details of the later, see [Centralized Media Manager](#) on page 712.

| Name                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Days to Retain Calls</b>       | <p>Default = 180 days. Range = 0 to 180 days.</p> <p>The number of days for which the database retains the call details. After this, Media Manager deletes the call recordings.</p> <ul style="list-style-type: none"> <li>• To disable the deletion, enter 0.</li> <li>• Note: Media Manager also starts deleting call recordings as soon as the allocated storage is full.</li> </ul>                                                                                                                                                                                                                    |
| <b>Audit Retain Period (Days)</b> | <p>Default = 180 days</p> <p>The number of days for which the Audit Trail or recordings are retained in IP Office Media Manager. The minimum value for this field is 1 day and the maximum 365 days.</p>                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Active Connector</b>           | <p>Default = Blank</p> <p>The connector being used for remote archiving copies of recordings. The drop-down menu lists all the available connectors that have been configured. Changing the connector results in a change in the archive destination. However, the recordings from the previous archives are still available.</p>                                                                                                                                                                                                                                                                          |
| <b>Call Storage Type</b>          | <p>Default = Local Hard Drive</p> <p>Sets the destination that Media Manager use as its primary storage for recordings collected from the <b>Handover Folder</b>.</p> <ul style="list-style-type: none"> <li>• <b>Local Hard Drive</b> - Use the local hard drive partition specified by the <b>Call Storage Path</b> setting.</li> <li>• <b>Hosted Storage</b> - Use the cloud-based storage specified by the <b>Hosted Storage Type</b> settings.</li> </ul>                                                                                                                                             |
| <b>Call Storage Path</b>          | <p>Default = Blank.</p> <p>This field is available when the <b>Call Storage Type</b> is set to <b>Local Hard Drive</b>.</p> <ul style="list-style-type: none"> <li>• If the additional drive was added using the path <code>/additional-hdd#1</code>, enter <code>/additional-hdd#1/partition1</code>. The additional drive path used can be seen in the server's <b>Platform View</b> menus.</li> <li>• If you must change the value after you have already started recording, copy all the sub-directories and files from the old directory to the new directory before you resume recording.</li> </ul> |
| <b>Hosted Storage Type</b>        | <p>This field is available when the <b>Call Storage Type</b> is set to <b>Hosted Storage</b>. The supported options are <b>Amazon S3 Bucket</b>, <b>Google Cloud Storage Bucket</b>, and <b>Microsoft Azure Blob Storage</b>.</p> <p>Additional fields are shown depending on the selected <b>Call Storage Type</b>. For details, see the <i>Administering Avaya IP Office™ Platform Media Manager</i> manual.</p>                                                                                                                                                                                         |
| <b>Send Email</b>                 | <p>Default = No</p> <p>The option to select whether the system must send emails for alarms and events.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Table continues...

| Name                              | Description                                                                                                                                                                                                       |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SMTP Mail Server</b>           | Default = Blank<br>The SMTP mail server that IP Office Media Manager uses to send email messages about alarms and events. If you leave this field blank, system cannot send email messages for alarms and events. |
| <b>SMTP Port</b>                  | Default = Blank<br>The SMTP port to which the service sends email messages.                                                                                                                                       |
| <b>Secured Connection</b>         | Default = No<br>The option to indicate whether the connection is secured. A secured connection uses Transport Layer Security (TLS) protocol to communicate.                                                       |
| <b>SMTP User Name</b>             | Default = Blank<br>The user's name for the SMTP server. You can leave this field blank if SMTP server does not require sender authentication. If required, set the user's name here.                              |
| <b>SMTP Password</b>              | Default = Blank<br>The password for the SMTP server. You can leave this field blank if SMTP server does not require sender authentication. If required, set the password here.                                    |
| <b>SMTP Mail "From" Address</b>   | The address from which the SMTP emails containing the alarms and events originate.                                                                                                                                |
| <b>Send Alarm/Event Emails To</b> | The email addresses to which alarms and events must be sent. You can add more than one email address by adding a semi-colon (;) between two email addresses.                                                      |

## Connectors

### Applications > Media Manager > Connectors

For details of adding and editing connectors, see the *Administering Avaya IP Office™ Platform Media Manager* manual.

| Name             | Description                                                                                                                                                                                                      |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Add</b>       | The drop-down menu to select a connector. The options are <b>DVD</b> , <b>NAS</b> , <b>Google drive</b> , <b>Amazon S3 Bucket</b> , <b>Google Cloud Storage Bucket</b> and <b>Microsoft Azure Blob Storage</b> . |
| <b>Name</b>      | The name of the connector.                                                                                                                                                                                       |
| <b>Type</b>      | The type of connector selected.                                                                                                                                                                                  |
| <b>Active</b>    | The state of the connector.                                                                                                                                                                                      |
| <b>Reachable</b> | The field that indicates whether the connector is reachable.                                                                                                                                                     |

*Table continues...*

| Name                                | Description                                        |
|-------------------------------------|----------------------------------------------------|
| <b>Pending Files #</b>              | The files that are yet to be archived.             |
| <b>Last Successful Archive Time</b> | The time the connector was last used successfully. |

## Recordings

**Applications > Media Manager > Recordings**

System administrators can use this menu to view and manage call recordings. Access to call recordings for individual users should be configured through their web self-administration settings.

| Name                  | Description                                                               |
|-----------------------|---------------------------------------------------------------------------|
| <b>Call Date</b>      | The date of the call.                                                     |
| <b>Length</b>         | The duration of the recording.                                            |
| <b>Parties</b>        | The users that participated in a conference call.                         |
| <b>Call Direction</b> | The field indicates whether the call was Internal, Incoming, or Outgoing. |
| <b>Agents</b>         | The agents involved in the call.                                          |

*Table continues...*

| Name           | Description                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Owner</b>   | The owner of the recording. Each recording has an owner; the owner is the number of the extension that recorded the call. Any one of the following can be an owner: <ul style="list-style-type: none"> <li>• Calling party extension</li> <li>• Called party extension</li> <li>• Hunt group extension</li> <li>• A line number</li> <li>• An account code</li> <li>• An agent extension</li> </ul> |
| <b>Targets</b> | The phone numbers of the recipients of the call.                                                                                                                                                                                                                                                                                                                                                    |
| <b>Skills</b>  | The skill set of the agent involved in the call.                                                                                                                                                                                                                                                                                                                                                    |
| <b>Call ID</b> | The unique identification number associated with the call recording.                                                                                                                                                                                                                                                                                                                                |

## Migration

### Applications > Media Manager > Migration

IP Office Release 11 does not support Contact Recorder. However, existing customers of Contact Recorder can migrate their call record database to Media Manager, which is the only archiving solution in IP Office Release 11. The migration process includes migration of only the metadata of the call records stored in Contact Recorder locally, or remotely on DVD or NAS. The migration process does not move the actual media files. Using the migrated metadata, Media Manager identifies the call recordings and provides playback, downloading, and housekeeping facility. VRLA records migrated from Contact Recorder can still be verified for tampering using the Media Manager interface. Thus Media Manager becomes a single interface for all call records, whether archived through Media Manager for newer recordings or the older recordings archived through Contact Recorder.

Existing Contact Recorder users can migrate to Media Manager through Web Manager. Administrators can migrate the Contact Recorder database to Media Manager using **Applications > Media Manager > Migration**. For detailed instructions, refer to *Administering Avaya IP Office™ Platform Media Manager*.

 **Note:**

Contact Recorder customers must back up their database prior to upgrading to IP Office Release 11.

|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Apply Filter</b> | <p>Use the button to refine your search. You can filter your search based on any one of the following criteria or both:</p> <ul style="list-style-type: none"><li>• <b>Start Date and End Date:</b> Filters the recordings used between these two dates.</li><li>• <b>Event Type:</b> Filters the recordings based on the type of use.</li></ul> |
| <b>Clear Filter</b> | Use the button to clear the filter.                                                                                                                                                                                                                                                                                                              |

# Chapter 50: Centralized Media Manager Recordings

## Applications > Media Manager > Centralized Media Manager Recordings

This menu allows system administrators to view and manage call recordings. Access to call recordings for individual users should be configured through their web self-administration settings.

| Name           | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Call Date      | The date of the call.                                                                                                                                                                                                                                                                                                                                                                        |
| Length         | The duration of the recording.                                                                                                                                                                                                                                                                                                                                                               |
| Parties        | The users that participated in a conference call.                                                                                                                                                                                                                                                                                                                                            |
| Call Direction | The field indicates whether the call was Internal, Incoming, or Outgoing.                                                                                                                                                                                                                                                                                                                    |
| Agents         | The agents involved in the call.                                                                                                                                                                                                                                                                                                                                                             |
| Owner          | The owner of the recording. Each recording has an owner; the owner is the number of the extension that recorded the call. Any one of the following can be an owner: <ul style="list-style-type: none"><li>• Calling party extension</li><li>• Called party extension</li><li>• Hunt group extension</li><li>• A line number</li><li>• An account code</li><li>• An agent extension</li></ul> |
| Targets        | The phone numbers of the recipients of the call.                                                                                                                                                                                                                                                                                                                                             |
| Skills         | The skill set of the agent involved in the call.                                                                                                                                                                                                                                                                                                                                             |
| Call ID        | The unique identification number associated with the call recording.                                                                                                                                                                                                                                                                                                                         |

### Filter

| Name                            | Description                                                                                                                                              |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Recording Range (Date and Time) | The date and time range between which the call was recorded. Use the calendars to select the dates and the adjacent drop-down menus to specify the time. |

*Table continues...*

| Name                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Recording Length</b> | <p>The length of the recording. Select one of the signs and enter the time in seconds. The available signs are:</p> <ul style="list-style-type: none"> <li>• = Equal to the recording length you have specified.</li> <li>• &lt; Less than the recording length you have specified.</li> <li>• &gt; Greater than the recording length you have specified.</li> <li>• &gt;= Greater than or equal to the recording length you have specified.</li> <li>• &lt;= Less than or equal to the recording length you have specified.</li> </ul> |
| <b>Call Direction</b>   | The direction of the call, that is, whether the call is Internal, Incoming, or Outgoing. Use the drop-down menu to select a Filter criterion.                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Parties</b>          | The parties involved in the call. Type the names of the parties. For more than one party, type the names separated by a comma.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Agents</b>           | The agents involved in the call. Type the names of the agents. For more than one agent, type the names of agents separated by a comma.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Target Number</b>    | The phone number of the recipient of the call. Type the target number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Skills</b>           | The skill set of the agent involved in the call.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Call ID</b>          | The unique identification number associated with the call recording.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Button              | Description                                                                                                                                                                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Apply Filter</b> | Click to apply the filter. All the recordings matching your search criteria are displayed on the right pane.                                                                                                                                                                                                                 |
| <b>Show All</b>     | The system displays all the recordings on the right pane.                                                                                                                                                                                                                                                                    |
| <b>Delete</b>       | Use the button to delete the selected recordings. You can select one or more recording using the check boxes corresponding to the recordings.                                                                                                                                                                                |

Your browser downloads the selected recordings as a zipped file.</li> </ol> |

# Part 7: Backup

# Chapter 51: Backup and Restore

This chapter looks at how the web manager menus can be used to configure backup and restore operation between servers.

- If the IP Office server hard disk has sufficient capacity, you can use it to receive backups from other IP Office servers. However, this is not a suitable solution for its own backups. Therefore, the recommendation is to backup to another IP Office server.
- Within a primary/secondary server pair, you can configure reciprocal backups.
- The preferred option is a separate backup server. This can be done by installing an IP Office Application server with a sufficiently large hard disk (see [Disk space required for backups](#) on page 645) and no services (Voicemail Pro and Avaya one-X Portal) enabled.

## Warning:

- Backup/restore is not supported between different server software release levels. Any exceptions are specifically documented in software release notes and migration documents.
- You cannot restore data to a server unless either the IP Address or the system id (LAN1 MAC address) match the server from which it was backed up.
- Backup and restore action must only be performed using servers inside a secure, trusted network.

## Backup and restore policy

It is essential to implement a comprehensive, robust and secure backup policy as part of a Business Continuity plan before any failure or other data restoration requirement. It is not possible to define a single approach that would meet all possible customer needs. Each installation should be assessed and an backup policy implemented. .

### Backup Key Information

The backup process supported by web manager only includes specific data, see [Backup data sets](#) on page 646. There is key information which, though included in the backup data, should also be recorded separately in case it is necessary to rebuild a failed sever:

- The ignition settings for each server should be recorded. For example, IP address and host name settings, server role, etc. These details may be required if a full reinstallation of the server becomes necessary before any data restoration operation.

In addition, the following are not included in the web manager backup processes and so must be backed up using other manual processes.

- Copies of any PLDS license key files used by the system.
- If using web manager to load custom voicemail prompts, copies of those prompt files.
- Copies of any custom phone settings files plus phone screen saver and background images.

### Backup Schedule

In addition to performing backups before major system changes such as an software upgrade, you must consider having a regular backup schedule.

- Periodic configuration backup for every IP Office.
- Periodic configuration backup for one X Portal – Server Edition Primary server and Application Server only
- Periodic configuration backup for Voicemail Pro – Server Edition Primary server only
- Periodic voice mailbox and recording data backup – Server Edition Primary server only
- The period and number of unique instances selected should reflect the frequency of change, the consequence due to data loss, and the storage capacity of the backup data server. It should also be borne in mind that the backup server used will only retain up to 14 backups, after which any further backup will cause the automatic deletion of the oldest previous backup.
- The timing of backup operation: This should be done when little or no traffic is present on the target system(s), but the backup process itself is not service-affecting.

### Additional Backup Options

This documentation only looks at the backup/restore process provided through the server's own web manager menus. The IP Office Manager and Voicemail Pro client application also provide methods for backing up the current IP Office service configuration and the voicemail configuration/mailbox contents respectively. Therefore also consider:

- Manual backup of the IP Office service configurations before major configuration changes.
- Manual backup of the Voicemail Pro before major configuration changes.

## Backup and restore protocols

Backup and restore is only supported using another IP Office server as the backup server. If necessary, an IP Office Application Server can be installed without enabling the Voicemail Pro and one-X Portal for IP Office services on that server.

 **Warning:**

- Backup and restore action must only be performed using servers inside a secure, trusted network.

The server being backed up requires a remote server connection to the backup server. That connection is configured with the settings below (see [Creating a remote server connection](#) on page 648). For a set of networked servers, the connection from the primary server is used for all the servers.

| Protocol | Port | Path                       | User Name/Password     | Notes                                                                                                    |
|----------|------|----------------------------|------------------------|----------------------------------------------------------------------------------------------------------|
| HTTPS    | 5443 | /avaya/backup              | none                   | HTTPS backup is enabled by default.                                                                      |
| HTTP     | 8000 | /avaya/backup              | none                   | HTTP backup is disabled by default. To enable it on the backup server, see Enabling HTTP backup support. |
| SFTP     | 22   | /var/www/html/avaya/backup | Administrator account. | —                                                                                                        |

## Enabling HTTP backup support

By default, HTTP support for backup/restore is disabled. You can enable it using the following process on the backup server.

 **Security alert:**

- Backup and restore action must only be performed using servers inside a secure, trusted network.

### Enabling HTTP Backup Support on the Backup Server

1. Login to the web manager menus of the backup server.
2. Select the servers **Platform View** option.

3. Within the platform view menus, select **Settings > System > HTTP Server**.
4. Select the **Enable HTTP file store for backup/restore** option and click **Save**.

## Disk space required for backups

The space required for a backup is highly variable. It depends on the number of servers included in the backup and the data sets selected. However, the largest and most significant backup is that required for voicemail.

The following tables show the potential space required for a worst case full backup. That is, one that assumes all the users have used their voicemail mailbox and other facilities to their maximum capacity.

The minimum disk size column indicates the disk hard disk size required to have a sufficiently large backup quota (see above) for at least one maximum full backup.

#### Backup for a Sever Edition Network

| Users | Maximum Full backup | Minimum Backup Server Disk Size |
|-------|---------------------|---------------------------------|
| 100   | 35GB                | 160GB                           |
| 750   | 78GB                | 214GB                           |
| 1500  | 127GB               | 275GB                           |
| 2000  | 158GB               | 320GB                           |
| 2500  | 189GB               | 360GB                           |

#### Backup for an IP Office Application Server/UCM

| Users | Maximum Full backup | Minimum Backup Server Disk Size |
|-------|---------------------|---------------------------------|
| 20    | 30GB                | 160GB                           |
| 50    | 32GB                | 160GB                           |
| 100   | 34GB                | 160GB                           |
| 150   | 37GB                | 165GB                           |

## Checking the backup server's backup quota

Backup is supported to a server with a hard disk of 160GB or larger. The actual portion of that space, the backup quota, available for backup usage can be checked using the process below. On servers with a smaller hard disk, no backup quota is supported.

### Estimating the Backup Quota

The approximate space that will be allocated for the backup quota can be calculated as follows:

- Backup Quota = (0.8 x Hard Disk Capacity) – 92GB if the Hard Disk Capacity is greater than 160GB, otherwise zero.
  - The capacities are all approximate. The quoted disk capacity from a disk manufacturer or a virtual server platform will differ from the capacity reported by the operating system.
  - For example: For a 500GB hard disk, the backup quota is approximately 308GB.

### Checking the Backup Server's Backup Quota

Once a server is installed, the actual space allocated for backups can be checked as follows:

1. Login to the backup server's web manager menus.
2. Click and select **Platform View**.
3. On the **System** tab, note the **Quota available for backup data** value. Note this is the total space usable for backups, it does not account for the space already used by any existing backups.
4. Click **Solution** to exit the platform view.

## Backup data sets

Each backup can include multiple selected servers. Within that backup a number of different data sets can be selected for inclusion in the backup.

The table summarizes the data included in the different backup data sets. Some data sets are greyed out if the related service is not running on one of the servers included in the backup.

When performing a restore it is also possible to select which servers and which data sets are included in the restore operation.

| Data Set           | Options                     | Contents                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Creating a remote server connection

Once the backup server has been configured, a remote server connection is required on the server to be backed up. In a network of servers, the remote connection s defined on the primary server.

### Procedure

1. In the Web Manager menu bar, click **Solution**.
2. Click **Solution Settings** and select **Remote Server**.
3. Click **Add Remote Server**.
4. Enter a name that identifies the connections use.
5. Set the **Protocol** to **HTTPS**, **HTTP** or **SFTP** as required.
  - These are the only protocols supported for backup/restore operations.
  - **HTTP** is only supported if the backup server has had HTTP enabled. See [Enabling HTTP backup support](#) on page 644.
6. Set the **Port** to match the selected protocol. The default ports are not necessarily correct.
  - For **HTTPS**, set the port to 5443.
  - For **HTTP**, set the port to 8000.
  - For **SFTP**, set the port to 22.
7. Set the **Remote Path** to `/avaya/backup`.
8. For **HTTP/HTTPS**, no **User Name** or **Password** details are required. For SFTP, use the details of a Web Manager administrator account.
9. Click **Save**.
10. The new remote server connection is now shown in the list of remote servers. It can now be selected for backup and restore actions.

## Backing up a server/servers

The system backs up the configuration of the server, application and user data in a single file set. You can use this backup file to restore the server or a failed server upgrade. The system backs up the configuration of the application to a local drive, in a predefined directory. You can take a backup of the primary server on a remote file server, which can optionally be the secondary server.

## Before you begin

- Create a remote server connection for the backup server. See [Creating a remote server connection](#) on page 648.

## About this task

You can take a back up of the primary server on a remote file server using Web Manager:

## Procedure

1. In the Web Manager menu bar, click **Solution**.
2. In the Solution page, select the servers that you want to backup.
3. Click **Actions** and select **Backup**.
4. Select which data sets you want to include in the backup. See [Backup data sets](#) on page 646 for details of the different sets contents.
5. In the **Backup Label** field, type a label for the backup.
6. In **Select Remote Server** drop down list, select the remote server that you have set.
7. To back up at a scheduled time:
  - a. In **Select Remote Server** drop down list, select the remote server that you have set.
  - b. Under **Schedule Options**, enable **Use Schedule**.
  - c. In the **Select Schedule** list, select the schedule option that you created.
  - d. Set a **Start Date** and a **Start Time**.
  - e. To configure a recurring backup, set **Recurring Schedule** to **Yes** and then set the **Frequency** and **Day of Week**.
8. Click **OK**.
9. The progress of the backup process is shown on the **Solution** menu.

# Restoring from the backup server

The following process is used to restore previously backed up data.

### Warning:

- Backup/restore is not supported between different server software release levels. Any exceptions are specifically documented in software release notes and migration documents.
- You cannot restore data to a server unless either the IP Address or the system id (LAN1 MAC address) match the server from which it was backed up.

- Close any Voicemail Pro client before attempting a restore. The restore process requires the voicemail service to restart. That will not occur if the Voicemail Pro client is connected to the service and will lead to incorrect restoration of data.
- During the restore process, the services being restored are restarted. This will end any calls using those services.

### Procedure

1. In the Web Manager menu bar, click **Solution**.
2. Select the servers onto which you want to restore data sets.
3. Click **Actions** and select **Restore**.
4. Select the **Remote Server** connection that points to the backup server.
5. Click **Get Restore Points**.
6. The system displays the backup data sets that it has for the selected servers.
7. Highlight the data sets that you want to restore.
8. Click **OK**.
9. The progress of the backup process is shown on the **Solution** menu.

## Restoring a failed server

The backup data can be used to attempt to restore a server that has failed.

### Procedure

1. Reinstall the original server software, ensuring that the same original IP address and host name settings are used.
2. Reignite the server back to its original role. If the server includes an additional hard drive containing call recordings for Media Manager, ensure that the option to reformat the additional drive is not selected during the server ignition.
3. Login to the server and complete its initial configuration.
4. If the server was part of a network, use the options within Manager to add it back into the network and ensure that the connections between the primary, secondary and expansions are all present.
5. At this stage, use the restore process (see [Restoring from the backup server](#) on page 649) to reload the original data.

# Part 8: VMPro Auto Attendants

# Chapter 52: Voicemail Pro Auto-Attendants

From IP Office R11.1 FP2, the system supports auto-attendants provided by Voicemail Pro but configured within IP Office Web Manager (these auto-attendants cannot be configured through IP Office Manager).

- This is separate from the auto-attendant services supported on IP500 V2 systems using embedded voicemail.

An auto-attendant consists of several greeting prompts that the callers hear and a set of definitions of what the system should do when the caller presses any particular telephone key. Once you have configured an auto-attendant, it can be used as the destination for incoming calls.

The system allows you to configure multiple auto-attendants:

- IP500 V2 systems support up to 40 auto-attendants.
- IP Office Server Edition and Select systems support auto-attendants depending on the Voicemail channel limit of the server.

For each, you can configure which actions are performed when the caller presses a key 0 to 9, \* and #.

| Feature                                   | Description                                                                                                                                                                                                                                                                                             |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Greetings and Time Profiles</b>        | Each auto-attendant can use time profiles to control which of up to 3 greeting is played to a caller. This allows different greetings, such as “Good morning”, “Good afternoon” or ““Sorry, we’re closed at the moment”” to be played based on the day of the week, time of day or even specific dates. |
| <b>The Menu Announcement</b>              | Following the currently active greeting (if any), the caller hears the menu announcement. This should list the auto-attendant actions that have been configured. For example “Press 1 for .., press 2 for ....”.                                                                                        |
| <b>Actions</b>                            | Separate actions can be defined for each of the standard telephone keys (0 to 9, * and #). Actions include transfer to a specified destination, transfer to another auto-attendant, transfer to an extension specified by the caller, etc.                                                              |
| <b>Text-to-Speech (TTS)</b>               | For subscription mode systems, the greetings and menus used by the auto-attendants can be generated using text-to-speech. This provides consistency in the prompt voice used whilst be able to make rapid changes.                                                                                      |
| <b>Automatic Speech Recognition (ASR)</b> | For subscription mode systems, automatic speech recognition can be used to detect the caller’s response to options provided by the auto-attendant.                                                                                                                                                      |

## Google TTS Prompt Language

Whilst the auto-attendant greeting and announcement prompts are recorded in a language of your choice, some of the auto-attendant actions may play additional prompts provided by the system. In that case, the language used for those system provided prompts is determined in several ways.

| System Type                       | Language Setting                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Fixed Language</b>             | If the system's <b>Google Speech AI</b> , or the auto-attendant's/system conferences <b>Speech AI</b> is set to a specific language, that language is used for all the system and TTS prompts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Call Locale Based Language</b> | <p>If the system's <b>Google Speech AI</b> language is set to <b>Off</b>, the language used for the auto-attendant's system prompts is determined from the locale associated with the call.</p> <ul style="list-style-type: none"> <li>• <b>Incoming Call Route Locale:</b> If the caller is external, the incoming call route locale is used if set.</li> <li>• <b>User Locale:</b> If the caller is internal, the user locale is used if set.</li> <li>• <b>System Locale:</b> If no user or incoming call route locale is set, the system locale is used unless overridden by a short code locale.</li> <li>• <b>Short Code Locale:</b> The short code locale is used, if set, if the call is routed to voicemail using the short code. This overrides the other locale settings.</li> </ul> |

## Text-to-Speech (TTS) Prompts

Subscription mode systems can use text-to-speech (TTS) generated prompts for a range of features. TTS is supported in a number of languages and with various voice choices, as shown in the table below.

Whenever the settings for a TTS prompt are changed, the next time the prompt is requested, including preview through the web administration menus, the resulting prompt is cached by the system as a local file. This removes the initial delay that can occur the first time a TTS prompt is played.

| Language | Number of Voices | Genders         |
|----------|------------------|-----------------|
| Arabic   | 3                | Female and Male |

*Table continues...*

| Language                 | Number of Voices | Genders         |
|--------------------------|------------------|-----------------|
| Czech                    | 1                | Female only     |
| Danish                   | 1                | Female only     |
| Dutch                    | 5                | Female and Male |
| English (Australian)     | 4                | Female and Male |

## Enabling Google Speech and the Default Voice

### About this task

Subscription systems can use Google speech to provide text-to-speech prompts and automatic speech recognition. These can be used with auto-attendants and system conferences.

#### Note:

- When enabled, the Google TTS is used for all Voicemail Pro TTS functions, overriding any locally installed TTS service.

### Procedure

1. Select **System > Voicemail**.

2. Enable **Google Speech AI**.
3. Select the default **Speech Language** and **Speech Voice** the system should use.
  - The choices are used as the system defaults. They can be overridden within each auto-attendant. The language can be overridden within Voicemail Pro call flows.
4. Save the updated settings.

## Auto-Attendant Fallback Options

Whilst auto-attendants are intended to let callers choose the required destination for their call themselves, there may be cases where this fails. For example, when the system does not detect any response from the caller or when it cannot match the response to any of its configured options.

There are a number of fallback routes that can be applied to calls in such scenarios:

| Stage                                   | Fallback Route                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Fallback Action</b>                  | <p>This option is used when the number of times the auto-attendant has waited for a valid response exceeds the <b>Menu Loop Count</b>. It can be configured to perform a chosen auto-attendant action. Otherwise, the system ends the call.</p> <ul style="list-style-type: none"> <li>• Note that this option may be overridden by the <b>Maximum Inactivity</b> timeout if it is reached first. See 'External Call Fallback' below.</li> </ul> |
| <b>Park and Page Fallback Number</b>    | <p>If the caller selects a <b>Park &amp; Page</b> action, their call is parked and waits to be unparked. If the call is still parked after a number of page attempts configured for the action, it is transferred to the action's configured <b>Fallback Number</b>.</p>                                                                                                                                                                         |
| <b>External Call Fallback Extension</b> | <p>This is an incoming call route setting. For external calls routed to an auto-attendant from an incoming call route, it is used if for some reason the auto-attendant service is not available.</p>                                                                                                                                                                                                                                            |

## Auto-Attendant Consent Example

In the following example, the business wants to record external calls to its sales group using the group's automatic recording settings. However, it needs to provide those callers with an option to opt-out of being recorded and to have that choice recorded in the system's log files.

Two sales groups are configured. Each with the same members but only one with automatic call recording of external calls configured.

A Sales auto-attendant was added.

## Enabling Google Speech and the Default Voice

### About this task

Subscription systems can use Google speech to provide text-to-speech prompts and automatic speech recognition. These can be used with auto-attendants and system conferences.

#### **Note:**

- When enabled, the Google TTS is used for all Voicemail Pro TTS functions, overriding any locally installed TTS service.

### Procedure

1. Select **System > Voicemail**.
2. Enable **Google Speech AI**.
3. Select the default **Speech Language** and **Speech Voice** the system should use.
  - The choices are used as the system defaults. They can be overridden within each auto-attendant. The language can be overridden within Voicemail Pro call flows.
4. Save the updated settings.

## Displaying the list of Auto-Attendants

Use the following process to display the list of auto-attendants configured on the system.

### Procedure

1. From the menu bar, select **Call Management** and then **Auto Attendants**.
2. The list of auto-attendants already configured on the system is displayed.
  - You can filter the list, for more details see Filtering the list section.
  - You can search the list, for more details see Searching the list section.
  - You can sort the list, for more details see Sorting the list section.
  - To edit a record, click on the  pencil icon adjacent to it.
  - To delete a record, click on the  trash can icon adjacent to it.
  - To add a new record, click on the **+ Add** button at the top of the list.

## Adding a new Auto-Attendant

Use the following process to add a new auto-attendant.

### Procedure

1. Click **+ Add Attendant**.
2. Use the form to enter the auto-attendant details. See [Voicemail Pro Auto-Attendant Settings](#) on page 663.
3. When you have configured the auto-attendant as required, click **Create**.
4. The new auto-attendant is added to the list.

## Deleting an Auto-Attendant

Use the following process to delete an auto-attendant.

### Important:

- Before deleting an entry, check that it is not being used as the destination for any other functions such as an auto-attendant action or incoming call route.

### Procedure

1. Click on the  trash can icon next to the entry to delete.
2. Click **Yes** to confirm the deletion.

### Related links

[Managing Auto-Attendants \(Voicemail Pro\)](#) on page 659

---

## Deleting multiple Auto-Attendants

- Before deleting an entry, check that it is not being used as the destination for any other functions such as an auto-attendant action or incoming call route.

### Procedure

1. Select the check box to the left of each entry that you want to delete.
  - You can select multiple entries. Note that moving to another page clears the existing selections.
  - To select all the entries, click the check box in the header row. You are prompted whether to include all entries on the pages not currently being displayed.
2. Click **Delete**.
3. Click **Yes** to confirm the deletion.

# Chapter 54: Voicemail Pro Auto-Attendant Settings

## Call Management > Auto Attendants > +Add

This section describes the auto-attendant settings used for subscription systems using Voicemail Pro. For auto-attendants provided by embedded voicemail on IP500 V2 systems, see Auto Attendant section.

These are split into two tabs.

| Tab                    | Description                                                                                      |
|------------------------|--------------------------------------------------------------------------------------------------|
| <b>Auto Attendants</b> | This tab defines the general settings of the auto-attendant and its greetings and announcements. |
| <b>Action</b>          | This tab defines the functions provided by the individual telephone keys.                        |

## Auto-Attendant

These settings are used to define the operation of the auto-attendant service whilst it waits for the caller to select an option from the configured actions.

For a visual summary of how these settings interact, see [Auto-Attendant Callflow](#) on page 656.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

### Auto-Attendant Settings

| Field       | Description                                                                                                                                                                                                               |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b> | Range = Up to 12 characters<br><br>The name for the auto-attendant. Set a name that acts as a reminder of the auto-attendants role. The name is then also shown in other menus used to route calls to the auto-attendant. |

It allows selection of a particular voice used for any text-to-speech features.</p> <p>See <a href="#">Text-to-Speech (TTS) Prompts</a> on page 654.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Greeting and Announcement Settings

When a caller reaches an auto-attendant, they first hear the attendant's current greeting (if any) and then the attendant's menu announcement.

- The greeting used is the first one (from up to 3 defined greetings) for which the greeting's associated time profile is currently active. This allows you to define greetings for different times of day (for example “*Good Morning*”, “*Good Afternoon*” and “*Sorry, we are currently closed*”) or different greetings for business and non-business days.
- The menu announcement should contain the instructions for the caller regarding the keys they can press and other actions.
- Each time a caller goes round the auto-attendant loop, they can respond (with key presses or speech) whilst any greeting and announcement menu prompt is being played.

| Field                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Menu Announcement</b> | <p>The menu announcement should contain the instructions for callers about the actions they can perform. For example; <i>"Press 1 for reception. Press 2 for sales, ..."</i></p> <p>It is used as follows:</p> <ul style="list-style-type: none"> <li>• When a call first reaches the auto-attendant, it is played to the caller after whichever greeting is currently active.</li> <li>• If the <b>Menu Loop Count</b> is not zero, it is played again at the start of each repeat loop.</li> <li>• The caller can respond by pressing a key whilst the announcement is being played. On subscription mode systems, if <b>Speech AI</b> is enabled they can also respond by speaking whilst the announcement is played.</li> <li>• After the announcement is played, the auto-attendant waits for a response for the time set by the <b>Maximum Inactivity</b> setting.</li> </ul> |
| <b>Menu Loop Count</b>   | <p>Default = 0 (<i>No Repeat</i>)</p> <p>This setting sets the number of times the auto-attendant will repeat the <b>Menu Announcement</b> and then wait for a valid response.</p> <p>If the caller does not respond or their response is not matched to an action:</p> <ul style="list-style-type: none"> <li>• If 0, the default, they hear the <b>No Match Prompt</b> prompt and the <b>Fallback Action</b> setting is used.</li> <li>• If non-zero but the number of repeat loops has not been reached, they hear the <b>No Match Prompt</b> and then the <b>Menu Announcement</b> again and the auto-attendant waits for a response again.</li> <li>• If non-zero and the number of repeat loops has been reached, they hear the <b>No Match Prompt</b> prompt and the <b>Fallback Action</b> setting is used.</li> </ul>                                                      |
| <b>No Match Prompt</b>   | <p>This prompt is heard when the caller does not respond in time or if their response does not match a configured action. For example; <i>"Sorry, no response was recognized."</i></p> <ul style="list-style-type: none"> <li>• Note that this prompt is also heard by callers who are about to be redirected to the <b>Fallback Action</b>. Therefore a prompt like <i>"Please try again"</i> would not be appropriate.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

The following settings are common to the menu announcement, greetings and error message. The greetings and announcements can be recorded from the phone, use an uploaded file or be provided by text-to-speech. Whichever method was last used or configured overrides any previous prompt.

| Field                          | Description                                                                                                                                                                                                                                                                   |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Dial To Record Greeting</b> | <p>Default = Automatically assigned. Not changeable.</p> <p>This field indicates the short code that can be dialed in order to record the greeting from an internal extension.</p> <p>See <a href="#">Recording Auto-Attendant Prompts Using Short Codes</a> on page 683.</p> |

## Actions

This tab defines the actions available to callers dependent on which DTMF key they press or, on subscription mode systems, based on automatic speech recognition of keywords. To change an action, click on the appropriate button.

The **Fallback Action** action applied is the user does not make a recognized choice is configured separately through the **No Match Prompt** prompt settings.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

### Settings: Keys/Events

The following actions can be assigned to the selected keys.

| Action              | Description                                                                                                           |
|---------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>0 to 9, *, #</b> | These keys correspond to the standard telephone dial pad key. Clicking on a key allows configuration of its settings. |
| <b>Fax</b>          | If configured, the <b>Fax</b> option is used when the system detects fax tone.                                        |

| Action                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Fallback Action</b>   | <p>Default = Drop Call</p> <p>This option is used when the number of times the auto-attendant has waited for a valid response from the caller has exceeded the <b>Menu Loop Count</b>. It is preceded by the <b>No Match Prompt</b> and then the configured action is performed.</p> <p>All actions are supported except <b>Park &amp; Page</b>, <b>Replay Menu Greeting</b>, <b>Speak By Name</b> and <b>Speak By Number</b></p> <p>You can choose whether to mention this option in the <b>Menu Announcement</b>. For example, if set to transfer to your receptionist, add "... or wait to for our operator."</p>                                                                                                                                                                                                                                                         |
| <b>Menu Announcement</b> | <p>The menu announcement should contain the instructions for callers about the actions they can perform. For example; "Press 1 for reception. Press 2 for sales, ..."</p> <p>It is used as follows:</p> <ul style="list-style-type: none"> <li>• When a call first reaches the auto-attendant, it is played to the caller after whichever greeting is currently active.</li> <li>• If the <b>Menu Loop Count</b> is not zero, it is played again at the start of each repeat loop.</li> <li>• The caller can respond by pressing a key whilst the announcement is being played. On subscription mode systems, if <b>Speech AI</b> is enabled they can also respond by speaking whilst the announcement is played.</li> <li>• After the announcement is played, the auto-attendant waits for a response for the time set by the <b>Maximum Inactivity</b> setting.</li> </ul> |

### Settings: Key Actions

| Action                      | Description                                                                                                                     |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Not configured</b>       | Perform no action.                                                                                                              |
| <b>Dial By Conference</b>   | <p>Allow the caller to dial the conference ID they require.</p> <p>See <a href="#">Dial By Conference</a> on page 670.</p>      |
| <b>Dial By Name</b>         | <p>Prompt the caller to dial the name of the user they require.</p> <p>See <a href="#">Dial By Name</a> on page 671.</p>        |
| <b>Dial By Number</b>       | <p>Allow the caller to dial the extension number they require.</p> <p>See <a href="#">Dial By Number</a> on page 673.</p>       |
| <b>Leave Message</b>        | <p>Redirect the caller a specified mailbox to leave a message.</p> <p>See <a href="#">Leave Message</a> on page 674.</p>        |
| <b>Supervised Transfer</b>  | <p>Transfer the caller to the specified extension number.</p> <p>See <a href="#">Supervised Transfer</a> on page 675.</p>       |
| <b>Park &amp; Page</b>      | <p>Park the call and make an announcement to the a specified group.</p> <p>See <a href="#">Park &amp; Page</a> on page 676.</p> |
| <b>Replay Menu Greeting</b> | <p>Replay the auto-attendant's menu announcement.</p> <p>See <a href="#">Replay Menu</a> on page 678.</p>                       |

| <b>Unsupervised Transfer</b>       | Transfers the caller to the specified extension number.<br>See <a href="#">Unsupervised Transfer</a> on page 681.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Transfer To Auto Attendant</b>  | Transfers the caller to another auto-attendant.<br>See <a href="#">Transfer to Auto Attendant</a> on page 682.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Speak By Name</b>               | Allow the caller to select from listed names using speech.<br>See <a href="#">Speak By Name</a> on page 679.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Speak By Number</b>             | Allow the caller to speak the extension number required.<br>See <a href="#">Speak By Number</a> on page 680.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Destination</b>                 | The destination depends on the action: <ul style="list-style-type: none"> <li>• <b>Leave Message, Supervised Transfer and Unsupervised Transfer</b> – Use the drop-down to select the target extension.</li> <li>• <b>Transfer To Auto Attendant</b> – Use the drop-down to select another existing auto-attendant.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Speech Recognition Keywords</b> | This option is only available on subscription mode systems and when <b>Speech AI</b> is set to a specific language. It allows the action to be triggered by speech recognition of keywords. <ul style="list-style-type: none"> <li>• The keywords must be unique. The same word cannot be used for another key.</li> <li>• Up to 3 keywords are supported per key, separated by commas. Note that using more keywords in total reduces the chances of a match.</li> <li>• Avoid using proper names. These are less likely to be matched as they may not match existing words in the speech recognition dictionaries used by Google.</li> <li>• Encourage matches by ensuring that the keywords are part of the announcements played to callers. For example, “Say whether you want Sales or Support” rather than “Say what department you want”.</li> </ul> |
| <b>Consent Directive</b>           | When a caller selects a particular action, the actions <b>Consent Directive</b> value is included in the system logs. These options allow you record whether the caller has indicated their consent to some action, for example call recording.<br>See <a href="#">Auto-Attendant Consent Example</a> on page 657. <ul style="list-style-type: none"> <li>• <b>Consent Not Applicable</b> – Indicates that the caller has not been prompted to select whether they consent to call recording.</li> <li>• <b>Consent Given</b> – Indicates that the caller has been prompted for their consent and has consented.</li> <li>• <b>Consent Denied</b> – Indicates that the caller has been prompted for their consent and has not consented.</li> </ul>                                                                                                         |

## Dial By Conference

This action allows the caller to select the conference they want to join by dialing the conference ID. For example, “If you know the conference you want, dial the conference number.”.

The behavior of the action depends on the auto-attendant’s **Direct By Conference** setting.

- **If enabled:** The caller’s key press to select the action is included in the digits they dial for a conference match. For example, if menu key 3 is used for the action, a caller can dial 3 and then 01 for conference 301.
- **If not enabled:** The caller’s key press to select the action is not included in the digits they dial for a conference match. For example, if menu key 3 is used for the action, a caller must dial 3 and then 301 for conference 301.

## Dial By Name

This action allows callers to dial the name that want and then hear a list of matches from which they can make a selection. For example, “To select from a list of names, press 1”.

Callers selecting this option are asked to dial the name of the user they require and then press #. They then hear a list of possible matches from which they can make a selection. The list uses the recording mailbox name prompts of matched users.

- The name matching uses the auto-attendant’s **Name Match Order** setting to either match against first or last names.
- The name used for matching is the user’s **Full Name** if set, otherwise their **Name** is used.

Users are excluded from matching if they:

- Are marked as **Ex Directory** in their user settings.
- Do not have a recorded mailbox name prompt. Normally user’s are asked to record a name when they first access their mailbox. See [Recording User Name Prompts](#) on page 685.

Dial By Name assumes that a standard ITU lettered dialing pad is being used.

### How Dial By Name works

1. The caller is prompted to dial the name they require and then press #.
  - For example: Dialing **527** matches names starting with JAS (for example "Jason") and KAR (for example "Karl").
  - Callers can also press **\*#** to exit without making a selection.
2. Depending on the number of matches found:
  - If no matches are found, the caller is given the option to retry.
  - If 10 or less matches are found, the matching mailbox name greetings are played as part of a list. For example, "Press 1 for ..., Press 2 for ..., Press 3 for ...".
  - If more than 10 matches are found, the caller is prompted to either press **#** to hear the first 10 matches or to dial more characters to reduce the number of matches. If they select to play the list, after each set of 10 matches they can either make a selection or follow the prompts for other options.

---

## Dial By Number

This action allows the caller to select the extension they want by dialing the extension number. It can be used to allow callers to directly access user and group extension numbers.

For example, “If you know the extension you want, dial the extension number.” or “If you know the extension you want, press 1 followed by the extension number”.

The behavior of the action depends on the auto-attendant’s **Direct By Number** setting.

- **If enabled:** The caller’s key press to select the action is included in the digits they dial for a extension match. For example, if menu key 2 is used for the action, a caller can dial 2 and then 01 for extension 201.
- **If not enabled:** The caller’s key press to select the action is not included in the digits they dial for extension match. For example, if menu key 2 is used for the action, a caller must dial 2 and then 201 for extension 201.

## Park & Page

This action parks the caller whilst the system performs a page to a specified user or group extension number. The page message includes the park slot number assigned to the parked call so that anyone who hears the page can unpark it.

- Whilst parked, the caller hears music on hold.
- The system uses the prompt you have configured for the button to announce that there is a parked call. It then states the park slot number which can be used to unpark the call.

## Action Settings

| Key                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Park Slot Prefix</b>            | <p>The park slot prefix number. Maximum is 8 digits. A 0-9 will be added to this prefix to form a complete park slot ID for the parked call.</p> <p>The system the park slot prefix to create park slot for a call by adding an extra digit (0-9). For example, if you set 62080 as the prefix, the system uses a number between 620800 and 620809 to park calls.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Paging Number</b>               | Select the user or group which the system will page in order to announce the parked caller.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Retry Count</b>                 | The number of page retries. The range is 0 to 5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Retry Timeout</b>               | <p>Default = 15 seconds.</p> <p>The time, in minutes and seconds, between paging retries. The value can be set in 15 second increments up to a maximum of 5 minutes. The default is 15 seconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Fallback Number</b>             | The extension number to which the park called should be presented if, after the final page and retry timeout, the call is still parked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Replay Menu

This action replays the auto-attendants **Menu Announcement** recording. For example, “To hear the options again, press #”.

Replaying the greeting does not count as a loop for auto-attendant’s **Menu Loop Count**.

## Recording Auto-Attendant Prompts Using Short Codes

The **Dial To Record Greeting** values shown in the auto-attendant menus indicates a short code which can be used to play and record the associated auto-attendant prompt.

- These short codes can be dialed from any internal extension.
- The short codes can only be used if the auto-attendants **Enable Local Recording** setting is enabled.
- Recording a prompt using this method overrides any previously uploaded audio file or TTS settings for the prompt.

### Using a Short Code

When using the short codes, you will be prompted as follows:

- Press **1** to hear the current recorded prompt if any.
- Press **2** to record a new prompt.
  - After the tone, record the prompt. Note that the prompt must be at least 3 seconds in length.
  - Press **2** again to end recording.
- Press **3** to save the new prompt.

### Short Codes List

- **Optional Greeting 1** – Dial **\*81** followed by the **AA Number** . For example, **\*8101** for the first auto-attendant.

- **Optional Greeting 2** – Dial \*82 followed by the **AA Number**. For example, \*8201.
- **Optional Greeting 3** – Dial \*83 followed by the **AA Number**. For example, \*8301.
- **Menu Announcement** – Dial \*84 followed by the **AA Number**. For example, \*8401.
- **No Match Prompt** – Dial \*87 followed by the **AA Number**. For example, \*8701.
- **Park & Page Prompts** – Dial \*80 followed by the action key being used (0 to 9) and then the **AA Number**. For example, for a park & page action on button 2 of the first auto-attendant, dial \*80201. These prompts are used as part of the page call made by the system.
  - For the \* key, dial \*8510 followed by the **AA Number**. For example, \*851001 for the first auto-attendant.
  - For the # key, dial \*8511 followed by the **AA Number**. For example, \*851101.

### How are the Dialing Codes Configured?

The dialing codes use system short codes which are automatically added to the system configuration when the first auto-attendant is created. Editing or deleting those system short codes will affect the operation of the codes shown in the auto-attendant menus.

These short codes use the **Auto Attendant** feature.

## Using Pre-Recorded Prompt Files

You can use pre-recorded audio files as prompts for the auto-attendant.

- Prompt file uploading is only supported when using IP Office Web Manager. It cannot be done from the IP Office Manager menu.
- The file must be a .wav file in Mono PCM 16-bit format, either 8, 16 or 22KHz. Maximum length 10 minutes.

#### To upload an audio file:

1. Note that uploading a file will override any previously recorded audio file or TTS setting.
2. For the greeting and menu announcement prompts, click on the **Audio Output** and select **Audio File (wav)**.
3. Click on **Upload** and select the recording file. Alternatively, drag and drop the file into the text box.
4. Click on **Upload**.
5. Use the playback controls to test the recording.

## Recording Auto-Attendant Prompts Using Text-to-Speech

On subscription mode systems, Text-to-Speech (TTS) can be used to provide the auto-attendant greetings and menu announcement prompts.

- TTS prompts are only available when **Google Speech AI** is enabled. See [Enabling Google Speech and the Default Voice](#) on page 655.
- The language used for TTS prompts is set by the auto-attendant's **Speech AI** setting.
- The voice used is set by the auto-attendant's **Speech Voice** setting. See [Text-to-Speech \(TTS\) Prompts](#) on page 654.
- You can enter up to 250 words as a prompt.
- Commas are treated as a short pause, semi-colons as a long pause.
- If using IP Office Web Manager, you can preview the prompt by clicking on the  icon. Note that there is a short delay whilst the new prompt is created and downloaded.
- Following any changes, once a prompt is played or previewed, it is cached by the system in order to remove any future playback delay.

### To create a TTS prompt:

1. Note that configuring TTS will override any previously recorded audio file.
2. Click on the **Audio Output** and select **Text To Speech**.
3. Enter the required text into the text box.
  - Use a comma to add a short pause.
  - Use a period to add a long pause.
  - To add emphasis to a particular word, add \_ underscores before and after the word.
4. The following steps are only supported using IP Office Web Manager. Click on the  to preview the prompt.
  - There is a short delay the first time the prompt is created following any changes. The prompt file is then cached by the system for future use.
  - For long prompts, use the playback controls to select which part of the prompt is played.
5. Make any changes required to the text.

## Recording User Name Prompts

The **Dial By Name** and **Speak By Name** features only include users who have recorded a mailbox name (and are not set as ex-directory). By default, users are asked to record a name when they first access their mailbox.

However, in some scenarios this may need to be done separately. The method for recording the user name depend on how they access their mailbox and the mode in which the voicemail service is running.

### Visual Voice

If the user accesses voicemail mailbox using the visual voice menu on their phone, they can use the following process to record their name:

1. Access visual voice.
2. Scroll down to and select **Name**.
3. Record a name.
4. When happy with the recording, press **Select**.

### Intuity Mailbox Mode

If the user access their voicemail mailbox using spoken prompts, for example by dialing \*17, they can use the following process to record their name:

1. Access the mailbox prompts.
2. Press **5**.
3. Press **5** again.
4. The user will hear their current name recording, if any.
5. After the tone, record a name and press **1**.
6. The name is played again.
  - To accept the recording, press **#**.
  - To record the name again, press **1**.

### IP Office Mailbox Mode

If the user access their voicemail mailbox using spoken prompts, for example by dialing \*17, they can use the following process to record their name:

1. Access the mailbox prompts.
2. Press **\*05** to select the option to record your name.
3. Press **1** to hear your current recording.
4. Press **2** to record your name. When prompted, speak your name. The maximum recorded length is 5 seconds.
5. Press **2** when you have finished recording your name.
6. Press **1** to listen to your new recording. Review the recording and select one of the following options:
  - To save the new recording: Press **3**.
  - To record your name again: Press **2**.

---

## Routing External Calls to an Auto-Attendant

Once an auto-attendant has been created, it becomes selectable as a destination in other menus, for example incoming call routes. This is shown by entries prefixed with **AA:** in the drop-down lists of selectable destinations.

## Related links

[Routing Calls to a Voicemail Pro Auto-Attendant](#) on page 687

---

## Routing Internal Calls to an Auto-Attendant

Typically auto-attendants are not used for handling internal calls. However, it can be useful:

- To test the operation of an auto-attendant whilst it is being configured.
- As a number to which users can transfer external caller's who have been misdirected.

### Short Codes for Auto-Attendant Access

An internally dialable number to access an auto-attendant can be created using the **Auto Attendants** short code feature. For example:

- *\*99XX/Auto Attendant/"AA:"N* - This short code will allow calls to any auto-attendant using the **AA Number** when dialing. For example, \*9901 for the first auto-attendant.
- *\*99/Auto Attendant/"AA:AutoAttend01"* - This short code allows calls to a specific auto-attendant using the auto-attendant **Name** setting.

## Conference Types

The system supports conferences consisting of multiple internal and external parties.

| Conference Type                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ad-Hoc Conferences</b>          | An ad-hoc conference is one created by the system on the fly. For example, when a user with two calls in progress conferences those calls using their phone. For ad-hoc conferences, all internal users are treated as moderators.<br><br>See <a href="#">Ad-Hoc Conferencing</a> on page 698.                                                                                                                                                                                                                          |
| <b>Meet-Me Conferences</b>         | A meet-me conference is one started using a specific fixed conference ID number. This allows the use of various features to route and place calls into specific meet-me conferences.                                                                                                                                                                                                                                                                                                                                    |
| <b>Personal Meet-Me Conference</b> | Each user's own extension number is treated as their personal meet-me conference number. That user is the conference's only moderator. Other participants can join a personal meet-me conference at any time, however the audio conference only starts when the owner also joins. If the user's optional conference PIN has been configured, the system prompts other callers for the PIN when they try to access the personal meet-me conference.<br><br>See <a href="#">Personal Meet-Me Conferences</a> on page 700. |

*Table continues...*

| Conference Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System Meet-Me Conferences</b> | System meet-me conferences are configured by system administrators. Each system conference has a fixed conference ID and appears in the list of available destinations for auto-attendant actions, DDI numbers, incoming call routes, etc. Each system conference can be configured with multiple moderators, separate PINs for moderators and other participants, etc.<br><br>See <a href="#">System Conferences</a> on page 704. |

---

## Conference Participants

The following terms are used for the different roles people can have within a conference.

- **Participant** – Any member of a conference.
- **Delegate** – Any participant of a conference who is not a moderator.
- **Moderator** – Moderators have extra functions. For example they can drop and mute other participants. Who is or can be a moderator depends on the conference type:
  - **Ad-Hoc Conferences** – Any internal participant is automatically also a moderator.
  - **Personal Meet-Me Conferences** – The conference owner is the only moderator.
  - **System Conferences** – A participant of a system conference can become a moderator in either of 2 ways:
    - Specified internal users can be added to the conference's moderator list. Those users are automatically moderators.
    - If the optional moderator PIN is set, any caller who enters that PIN joins the conference as a moderator. This allows external callers to be moderators (though without ability to drop/mute other participants).
- **Owner** – Personal meet-me conferences are owned by the user with the same extension number as the conference ID. They are also automatically the conference's only moderator.

## User Conference Controls

Internal users who join a conference may also have access to controls which allow them to mute/unmute other parties and to drop other parties. The range of controls will depend on the conference type and whether the user is a moderator or a delegate.

## Phone Controls

Users with Avaya 1400, 1600, 9400, 9500, 9600, and J100 Series phones (except the J129) can view the list of conference participants. Using the list, they can access options to mute and drop themselves and other participants.

On these phones, programming **Conference Meet Me** buttons allows the user to receive indication of when a particular conference is in progress and to access that conference.

## User Portal Controls

Users with access to the User Portal can display details of the access settings for their own personal meet-me conference and for any system conferences for which they have been added to the moderator list. They also receive notification when other participants have joined their personal meet-me conference and are waiting for them to join.

When they join any conference, the portal displays a list of participants and controls for muting/dropping participants.

## one-X Portal

This application provides the user with a display of conference participant and controls to manage their conference participation. It can also provide the user with controls for scheduling conferences and sending invitations to other conference participants.

## SoftConsole

This application display details of conferences in progress to assist with transferring callers into a conference. It also provides menus for starting two meet-me conferences.

# Conference Capacities

For full details on system capacities, refer to *Avaya IP Office™ Platform Guidelines: Capacity*.

The following table summarizes the overall system capacity for conference calls and maximum participants in any individual conference call. This capacity limits apply to all conference types.

| System Mode              | Total Conference Participants | Maximum Conference Size |
|--------------------------|-------------------------------|-------------------------|
| IP Office Server Edition | 256                           | 256                     |
| IP Office Select         | 512                           | 256                     |
| IP Office Subscription   |                               |                         |
| IP500 V2                 | 128                           | 64                      |

## System Meet-Me Conferences

System meet-me conferences use the same resources as above. However, in addition there are limits on the number that can be configured.

|                | Maximum Configured |
|----------------|--------------------|
| IP500 V2       | 30                 |
| Other networks | 120                |

In an IP Office Server Edition/Select network, these conferences are hosted on the primary server. If a secondary server is present, that server will host the system conferences during primary server resilience.

## Conference ID Numbers

Every conference is assigned a conference ID number. That number can be used with other features (short codes, programmable buttons) in order to join that conference.

- Ad-hoc conferences are automatically assigned a conference ID number when started. Each ad-hoc conference uses the first available ID from 100 upwards.
- Meet-me conferences use pre-set conference IDs set as follows:
  - Personal meet-me conferences use a conference ID that matches the extension number of the conference owner and moderator.
  - System meet-me conferences use the conference ID specified when the conference settings are configured.
  - It is advisable not to use conference ID's that are near the range that may be in use for ad-hoc conferences as above (100 plus). Once a conference ID is in use by an ad-hoc conference, it is no longer possible to join the conference using the various conference meet me features.

## Conference Notes

| Feature                                   | Details                                                                                                                                                                                                                            |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Other Uses of Conference Resources</b> | System features such as call intrusion, call recording and silent monitoring all use conference resources for their operation. On IP500 V2 systems, each Embedded Voicemail call in progress also reduces the conference capacity. |

*Table continues...*

| Feature                                 | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Automatically Ending Conferences</b> | <p>The behavior for the system automatically ending a conference varies as follows:</p> <ul style="list-style-type: none"> <li>• A conference remains active until the last extension or trunk with reliable disconnect leaves. Connections to voicemail or a trunk without reliable disconnect (for example an analog loop-start trunk) will not hold a conference open.</li> <li>• The <b>Drop External Only Impromptu Conference</b> setting controls whether a conference is automatically ended when the last internal party exits the conference.</li> </ul> |
| <b>Analog Trunk Restriction</b>         | In conferences that include external calls, only a maximum of two analog trunk calls are supported. This limit is not enforced by the system software.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Recording Conferences</b>            | If call recording is supported, conference calls can be recorded just like normal calls. Note however that recording is automatically stopped when a new party joins the conference and must be restarted manually. This is to stop parties being added to a conference after any "advice of recording" message has been played.                                                                                                                                                                                                                                   |
| <b>IP Trunks and Extensions</b>         | Conferencing is performed by services on the system's non-IP interface. Therefore a voice compression channel is required for each IP trunk or extension involved in the conference.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Call Routing</b>                     | A short code routing calls into a conference can be used as an Incoming Call Route destination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Conference Tones</b>                 | The system provides conference tones. These will be either played when a party enters/leaves the conference or as a regularly repeated tone. This is controlled by the Conferencing Tone ( <b>System   Telephony   Tones &amp; Music</b> ) option.                                                                                                                                                                                                                                                                                                                 |

## Conference Phones

The system does not restrict the type of phone that can be included in a conference call.

| Feature                        | Details                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use Mute</b>                | When not speaking, use of the mute function helps prevent background noise from your location being added to the conference call. This is especially important if you are attempting to participate handsfree.                                                                                                                                                               |
| <b>Handsfree Participation</b> | While many Avaya telephones can be used fully handsfree during a call, that mode of operation is intended only for a single user, seated directly in front of the phone. Attempting to use a handsfree phones for multiple people to listen to and participate in a call will rarely yield good results. See below for details of conference phones supported by the system. |

*Table continues...*

| Feature                            | Details                                                                                                                                                                                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Dedicated Conference Phones</b> | To allow multiple people in one room to speak and listen to a conference call, the system supports the following conference phones: <ul style="list-style-type: none"> <li>• B100 Conference Phones (B179 and B199).</li> <li>• Audio Conferencing Unit (ACU).</li> </ul> |
| <b>Group Listen</b>                | The <b>Group Listen</b> function can be used via a programmable button or short code. It allows the caller to be heard through a phone's handsfree speaker while only being talked to via the phone's handset.                                                            |

## Context Sensitive Conferencing

On 1400, 1600, 9400, 9500, 9600, and J100 Series telephones there have been changes to the display and handling of calls put on hold pending transfer. For those phones there have also been changes to which calls are conferenced when a **Conference** button or **Conf** display option is pressed on the telephone.

- Previously, pressing **Conference** would put the user's current call and all held calls into a conference. That included any calls that had been put on hold pending transfer by pressing **Transfer**.
- The result of pressing **Conference** on the telephone now depends on which call is currently highlighted on the phone display and what other calls are held or held pending transfer.

| Which call is highlighted on the display | Other condition (in priority order)  | Result when Conference is pressed:                                                                      | Calls Conferenced |            |                       |
|------------------------------------------|--------------------------------------|---------------------------------------------------------------------------------------------------------|-------------------|------------|-----------------------|
|                                          |                                      |                                                                                                         | Connected Call    | Held Calls | Held Pending Transfer |
| <b>Connected call</b>                    | <b>No call held pending transfer</b> | Conferences the connected call and all held calls.                                                      | ✓                 | ✓          | —                     |
|                                          | <b>Call held pending transfer</b>    | Conferences the connected call and the held pending transfer call. Any other held calls are unaffected. | ✓                 | —          | ✓                     |

| <b>Held pending transfer call</b>        | <b>Connected call</b>               | Conferences the held pending transfer call to a connected call. Any other held calls are unaffected.                   | ✓                 | —          | ✓                     |
|                                          | <b>Held calls</b>                   | Conferences the call held pending transfer with all other held calls.                                                  | —                 | ✓          | ✓                     |

Note that this new behavior only applies to conferences being initiated from the telephone. The original behavior of conferencing all calls still applies if the conference function is initiated from elsewhere such as from an application like one-X Portal.

- **Changing which call is currently highlighted**

On phones with a set of cursor keys (four cursor keys around an **OK** key), the up and down cursor key can be used to change the current highlighted call (or call appearance if idle). This can be done even whilst there is a currently connected call. On touchscreen phones, the cursor buttons on the right-hand edge of the screen can be used for the same purpose.

The method of highlighting is:

- **- 1400/1600 Series Telephones**

On these phones only details of a single call are shown on the display at any time. The displayed call is the currently highlighted call.

- **- 9400/9500/9600/J100 Series Telephones**

On most phones in these series, the background of the shading is changed for the currently selected call. The exceptions are 9611, 9621, 9641, J159 and J179 telephones where a yellow symbol is shown on the right of the highlighted call.

# Chapter 59: Ad-Hoc Conferencing

An ad-hoc conference is one created by the system on the fly. For example, when a user with two calls in progress conferences those calls using their phone. For ad-hoc conferences, all internal users are treated as moderators.

---

## Dropping External Party Only Conferences

### About this task

It may be desirable to prevent ad-hoc conferences from continuing if there are no internal users involved. This can be enabled for the whole system.

### Procedure

1. Select **System Settings**.
2. Click **System**.
3. Select **Drop External Only Impromptu Conference**.
  - If enabled, when the last remaining internal user exits the conference, the conference is ended regardless of whether it still includes other external parties
  - If disabled, the conference is only ended when the last party exits the conference.
4. Click **Update**.

## Adding Callers to an Ad-Hoc Conference

The method of starting an ad-hoc conference depends on the particular phone or softphone being used. It will typically involve putting an existing call on hold, making an additional call and then

selecting a conference option. The same method can usually be used for adding additional parties to an existing conference.

If necessary, controls for starting and adding users to an ad-hoc conference can be created using short codes and programmable buttons. Note that when used to add a party to an existing conference, these controls also work with existing meet-me conferences.

**Related links**

[Ad-Hoc Conferencing](#) on page 698

# Chapter 60: Personal Meet-Me Conferences

Each user's own extension number is treated as their personal meet-me conference number. That user is the conference's only moderator. Other participants can join a personal meet-me conference at any time, however the audio conference only starts when the owner also joins. If the user's optional conference PIN has been configured, the system prompts other callers for the PIN when they try to access the personal meet-me conference.

- Participants who join a personal meet-me conference before the owner, are put on hold until the owner joins. Whilst on-hold they hear repeated tones.
- If the user has a audio conference PIN set, callers joining the user's personal meet-me conference are prompted to enter that PIN.
- Personal and system meet-me features can create conferences that include only one or two parties. These are still conferences that are using resources from the system's conference capacity.

## Setting a User's Personal Conference PIN

### About this task

If the user has a audio conference PIN set, other callers attempting to joining their personal meet-me conference are prompted to enter that PIN.

- Putting an **L** before the PIN, disables the user's personal audio conference.

### Procedure

1. From the menu bar, select **Call Management** and then **Users**.
2. Locate the user you want to edit and click the  icon next to them.
3. On the **User** tab, select **Audio Conference PIN**.
4. Enter a numeric PIN code of up to 15 digits.
5. Click **Update**.

## Routing Internal Callers to a Meet-Me Conference

Internal users can join personal meet-me and system conferences using short codes or a programmable button.

### Using Short Codes

The **Conference Meet Me** short code feature can be used to create short codes that put the user into a meet me conference.

The default short code for this is \*66\*N# where N is the conference ID of the conference required.

- Internal users can also use the short codes to transfer callers into a conference.
- The same short codes can also be used by external callers to join the conference by setting the short code as the destination in features such as an auto-attendant transfer.
- For personal meet-me conferences, the short code can also specify a music source to use rather than tones if the conference owner has not already joined. System meet-me conferences use the conference's own separate **Hold Music** setting.

### Using a Programmable Button

The **Conference Meet Me** button feature can be used to create a programmable button to join a personal meet-me or system conferences. The button can also be used to transfer other caller's into a conference.

- If the button is configured with a specific conference ID, the button also shows the status of the conference.
- If the button is configured without a conference ID, when pressed the user is prompted to enter the required conference ID.

This option is not supported on J139 and non-Avaya phones.

[Personal Meet-Me Conferences](#) on page 700

## Personal Meet-Me Conference Callflow

The following flowcharts provide a simplified callflow for a personal meet-me conference.

### Personal Meet-Me Conference

### Get Owner's Audio Conference PIN

If the conference owner has an **Audio Conference PIN** set, other participants are required to enter that PIN in order to join the conference.

### Join The Conference

Participants can join the conference ahead of the owner. However, if that is the case, they will hear an announcement that the conference will not start until the moderator joins followed by tones or music-on-hold. The conference starts once the owner also joins the conference.

If the owner subsequently leaves the conference, the other participants hear ones or music-on-hold again until the owner rejoins.

# Chapter 61: System Conferences

System meet-me conferences provide:

- Optional participant PIN.
- Multiple optional moderators based on listed internal users and/or caller's who enter the optional moderator PIN.
- Automatic conference prompts for access control in per-conference selectable language.
- Recording per system conference.

## System Conference Examples

The system conference features allow the configuration of various different types of conference:

| Conference Type                                 | Method                                                                                               |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------|
| <b>Simple Conference</b>                        | A conference with no PIN codes, no moderators.                                                       |
| <b>Simple Conference with Access Control</b>    | A simple conference with a PIN code required for entry but no moderators.                            |
| <b>Moderated Conference</b>                     | A conference which does not start until a listed moderator joins and ends when no moderator remains. |
| <b>Moderated Conference with Access Control</b> | As above but with a PIN code required for entry.                                                     |
| <b>External Moderated Conference</b>            | Using a moderator PIN to allow external callers to assume the moderator role.                        |

## Adding a System Conference

### About this task

The number of system conferences that you can configure is limited as follows:

|                | Maximum Configured |
|----------------|--------------------|
| IP500 V2       | 30                 |
| Other networks | 120                |

This is in addition to the overall capacity limits for all conference types. See [Conference Capacities](#) on page 692.

### Procedure

1. Select **Call Management > Conferences**.
2. Click **+ Add**.
3. Configure the system conference settings. See [System Conference Settings](#) on page 706.
4. Click **Save**.

## Deleting a System Conference

### About this task

- Before deleting an entry, check that it is not being used as the destination for any other functions such as an auto-attendant action or incoming call route.

### Procedure

1. Select **Call Management > Conferences**.
2. Click on the  trash can icon next to the entry to delete.

3. Click **Yes** to confirm the deletion.

| Field                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Delegate Pin</b>   | <p>Optional. Range = Up to 30 digits.</p> <p>If set, the system will prompt callers, other than those in the <b>Moderator List</b> list, to enter a PIN before it allows them to join the conference.</p> <p>The system allows 3 PIN entry attempts before disconnecting the caller.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Moderator Pin</b>  | <p>Optional. Range = Up to 30 digits.</p> <p>If set, callers who enter this PIN rather than the <b>Delegate Pin</b> are added to the conference as a moderator. This allows moderators who are not in the <b>Moderator List</b> including external callers. Note however that external callers will not be able to access moderator controls other than starting/stopping the conference by their presence.</p>                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Hold Music</b>     | <p>Default = <b>Tone</b></p> <p>If the conference has been configured with moderators, this music is played to other participants who join the conference when no moderator is present. The music is also played if any present moderators leave the conference.</p> <ul style="list-style-type: none"> <li>• <b>Tone</b> – Play repeated system tones to participants whilst waiting for a conference moderator.</li> <li>• <b>System</b> – Use the system's default music-on-hold. This option is only shown in a music-on-hold file has been uploaded.</li> <li>• If other music sources have been configured, they can also be selected from the drop-down list.</li> </ul> <p>Before the hold music is played, participants will hear a prompt informing them of the reason for hearing the music.</p> |
| <b>Speech AI</b>      | <p>Default = Same as system</p> <p>On subscription systems, this and other text-to-speech options are available if the <b>System   Voicemail</b> setting for <b>Google Speech AI</b> is enabled.</p> <ul style="list-style-type: none"> <li>• If set to <b>Same as System</b>, the settings of the <b>System   Voicemail</b> form are used for TTS prompts.</li> <li>• If set to <b>Custom</b>, the <b>Language</b> and <b>Voice</b> fields below can be used.</li> </ul>                                                                                                                                                                                                                                                                                                                                   |
| <b>Language</b>       | <p>Default = Matches the system locale.</p> <p>Set the language used for prompts provided by the system for the system conference.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Voice</b>          | <p>Sets the voice to be used with the speech language. The number of voices available varies depending on the speech language selected.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Recording Type</b> | <p>Default = <b>Manual</b></p> <p>Sets the method by which recording of the system conference is controlled:</p> <ul style="list-style-type: none"> <li>• <b>Manual</b> – Recording can be started/stopped by moderators.</li> <li>• <b>Private</b> – No recording allowed.</li> <li>• <b>Automatic</b> – Automatically start recording the conference when started. The recording can be stopped/restarted by moderators.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                       |

Table continues...

| Field                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Recording Destination</b>        | <p>Default = <b>Conference Mailbox</b></p> <p>Sets the destination for system conference recordings. Note that the selected option may also affect the maximum recording length:</p> <ul style="list-style-type: none"> <li>• <b>Conference Mailbox</b> - Place calls into a standard group mailbox, using the conference ID as the mailbox number. Maximum recording length 60 minutes. Message waiting indication and visual voice access can be configured by adding <b>C&lt;conference ID&gt;</b> to a user's source numbers.</li> <li>• <b>Conference VRL</b> - Transfer the conference recordings to the systems VRL application (on subscription systems, set by the <b>System &gt; System &gt; Media Archival Solution</b> setting). Maximum recording length 5 hours.</li> </ul> |
| <b>Meeting Arrival Announcement</b> | <p>Default = Off</p> <p>If enabled, the system plays this prompt to callers before they join the conference. If conference PIN codes have been defined, it is played before the request to the caller to enter their PIN code.</p> <ul style="list-style-type: none"> <li>• <b>Audio Output</b> – Use an uploaded audio file. See .The file must be a .wav file in Mono PCM 16-bit format, either 8, 16 or 22KHz. Maximum length 10 minutes. To upload a file click on <b>Upload</b> and select the required file. Alternatively, click and drag the file onto the download box.</li> <li>• <b>Text-to-Speech</b> – Use a prompt generated using TTS. Up to 200 characters.</li> </ul>                                                                                                    |

## Routing External Calls to a System Conference

External callers can be routed to a conference using a number of methods:

- The conference ID appears as **Conf:<id>** in the **Destination** drop-down list for many functions:
  - From an **Incoming Call Route**, the **Destinations** drop-down includes system meet-me conferences configured on the system.
  - Through an auto-attendant, the configured conferences appear in the list of targets for **Unsupervised Transfer** actions.
- Using the **Dial By Conference** action, callers routed to an auto-attendant can dial the conference ID required.
- For other scenarios, the conference ID can be used as the number to which a call should be routed using the format **\*<ID>#**. For example in the telephone number field of a short code.

# Part 10: Centralized Media Manager

# Chapter 62: Centralized Media Manager

**Centralized Media Manager** is a cloud-based service supported for subscription mode IP Office systems. When supported by a system, the **Voice Recording Library** option becomes available in the IP Office configuration as a destination for manual and automatic call recording.

- **Centralized Media Manager** differs from **Local Media Manager** which runs on the same server as the Voicemail Pro service. For details of **Local Media Manager**, see the *Administering Avaya IP Office™ Platform Media Manager* manual.
- The **Subscription** menu shows if **Centralized Media Manager** is supported. See [Subscription](#) on page 450. The number of subscriptions controls the maximum number of supported recordings.
  1. 150,000
  2. 300,000
  3. 500,000
  4. 750,000
  5. 1,000,000
- **Centralized Media Manager** supports recording of up to 5 hours length.
- Centralized Media Manager automatically deletes each recording after a set number of days. By default that is 30 days. You can increase the retention period to up to 365 days.
  - For longer term storage, the copying of recordings to external Google storage can be configured. See [Archiving Recordings to External Storage](#) on page 723.
- Users can access the recording library through their user portal (see [Configuring User Access to the Recording Library](#) on page 714).
  - You can configure which users are able to access the library and which recordings they can access.
  - You can configure whether they can download recordings.
- You can access an audit trail that shows who has played and or downloaded recordings.
- If for any reason, connection between the customer system and **Centralized Media Manager** is not available, any new recordings waiting to be collected are deleted after 24-hours.

## Select local or centralized Media Manager

Use the following process to select which application the IP Office uses to store call recordings.

### Procedure

1. Select **System Settings** and then **System**.
2. Select **Media Archival Solution** and select the source required:

| Option                           | Description                                                                                                                                                                                                                                                                      |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Local Media Manager</b>       | Use the local Media Manager service running on the same server as the voicemail service. <ul style="list-style-type: none"><li>• For details of <b>Local Media Manager</b> configuration, see the <i>Administering Avaya IP Office™ Platform Media Manager</i> manual.</li></ul> |
| <b>Centralized Media Manager</b> | Use the centralized service provided by the cloud-based servers for subscription IP Office systems.                                                                                                                                                                              |

3. Click **Update**.

## Setting How Long Recordings are Kept

Centralized Media Manager automatically deletes each recording after a set number of days. By default that is 30 days. You can increase the retention period to up to 365 days.

- For longer term storage, the copying of recordings to external Google storage can be configured. See [Archiving Recordings to External Storage](#) on page 723.

### Procedure

1. Select **System Settings** and then **System**.
2. Select **Voicemail**.
3. Use the **Maximum Recording Retention (Days)** field to set how long recordings should be kept in the recording library before it is automatically deleted. It can be set to a value from 1 to 365 days.
4. Click **Update**.

## Configuring User Access to the Recording Library

You can configure access to the voice recording library for individual users. This allows them to list and play recordings through their web browser using the User Portal application. Refer to *Using the IP Office User Portal*.

### Procedure

1. Access the user's settings through **Call Management | Users**.
2. Select **Web Self-Administration**.
3. Select **Enable Media Manager Replay**.
4. Use the addition options to configure what recordings the user can access:

| Name                                | Description                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enable Media Manager Replay</b>  | <p>Default = Off.</p> <p>When enabled, the user can replay call recordings through web self-administration.</p> <ul style="list-style-type: none"> <li>• Note: For users where Media Manager is provided by a separate application server, recordings are viewed and accessed using the address of the application server rather than that of the IP Office system.</li> </ul>     |
| <b>Replay All Recordings</b>        | If selected, the user can view and replay all recordings.                                                                                                                                                                                                                                                                                                                          |
| <b>Replay Own Recordings</b>        | If selected, the user can view and replay their own call recordings. When enabled, the <b>Replay Recordings For Group</b> and <b>Replay Recordings For Others</b> options are also available.                                                                                                                                                                                      |
| <b>Replay Recordings For Group</b>  | These menus allows the selection of groups for which the user is able to view and replay recordings.                                                                                                                                                                                                                                                                               |
| <b>Replay Recordings For Others</b> | The field can be used to enter a list of numbers, separated by semi-colons, for which the user can view and playback recordings. Those numbers can be accounts codes, line numbers, user extensions and group extension numbers. The list can be 127 characters in length.                                                                                                         |
| <b>Download Recordings</b>          | <p>If selected, the user is able to download recordings as a separate file.</p> <ul style="list-style-type: none"> <li>• Downloaded files are outside of the control of the system. Therefore, if you allow users to download files, it is your responsibility to ensure that they comply with local privacy and data protection laws regarding the use of those files.</li> </ul> |

5. Click **Update**.

## Changing the Recording Source in the User Portal

Some systems may have previously used a local server and then switched to a cloud-based server. In that case they will have recordings stored both locally and centrally. In that case, using the process below in their user portal allows a user select from which source they are viewing stored recordings.

### Procedure

1. Within the user portal application, click on the logged in user name top-right.
2. Click on **Media Retrieval Preference**.
3. The menu that appears indicates the current recordings source.
4. To change source, click on the current source and select the source required.

| Preference                       | Description                                                                         |
|----------------------------------|-------------------------------------------------------------------------------------|
| <b>Local Media Manager</b>       | Recordings are stored and managed by an application running locally on your system. |
| <b>Centralized Media Manager</b> | Recordings are stored and managed by an application running on cloud-based servers. |

5. Click **Save**.

# Chapter 63: Viewing Recordings

Through web manager you can access and manage all recordings in the recordings library.

- Access is controlled by the user rights of the service user account used to log in to web manager. The account must be a member of a rights group that includes **External > Media Manager Standard** or **External > Media Manager Administrator** permission.

## Procedure

1. Click **Applications**.
2. Click **Voice Recordings Library**.
3. By default all recordings are listed. Use the filter settings to change the recordings listed. See [Applying a Recording Filter](#) on page 716.

## Related links

[Applying a Recording Filter](#) on page 716

---

## Applying a Recording Filter

You can apply a filter to the recordings displayed. This allows you to focus on only particular recordings

## Procedure

1. Display the recordings library. See [Viewing Recordings](#) on page 716.
2. To remove any existing filter settings, click **Show All**.
3. Enter the filter criteria that you want applied. You can use one or all of the following filter options. Any filter left blank is treated as matching all recordings.
  - **Recording Range (Date and Time)** – Select a start and end date and a start and end time for the recordings you want to see. Note that you need to set all 4 settings in order to apply a time and date filter. The values apply to the start of the recording.

- **Recording Length (sec)** – Select an operators and then the length in seconds. The operators are:
    - < - Only show calls shorter than the set length.
    - > - Only show calls longer than the set length.
    - = - Only show calls of exactly the set length.
  - **Call Direction** – If set, only show **Internal**, **Incoming** or **Outgoing** calls.
  - **Parties** – Only show recordings that involve any of the matching extension numbers as part of the call. You can enter the extension number or numbers of users and groups on your system.
    - To enter multiple numbers, separate each extension number with a , comma. For example 201, 202.
    - To enter a range of numbers, enter the start and end number with a - hyphen between them. For example 201-220.
  - **User Name** – The name of the user.
  - **Target Number** – The extension number of the original call target. For example, an incoming external call may have been originally targeted to a particular group extension number.
  - **Target Name** – The name of the original call target.
  - **Call ID** – The unique ID assigned to a recording.
4. Click **Apply Filter**.
- If required, you can save the filter settings. The settings are then automatically reapplied when you next access the menu. Click **Save Filter**.

---

## Playing Recordings

You can playback a recording directly from the browser.

### Procedure

1. Sort and filter the list of recordings to display the recording that you want play. See [Applying a Recording Filter](#) on page 716.
2. Click on the ► icon next to the recording you want to play.
3. The playback bar is displayed and the playback starts automatically.

- Pause and restart the playback by clicking the **||** and **▶** icons.
- The slider shows the progress of the playback. You can click the slider to select which part of the recording you hear.
- Use the **🔊** icon to mute/unmute the playback.

#### Related links

[Viewing Recordings](#) on page 716

---

## Downloading Recordings

The recordings are downloaded in Opus file format which can be played back through most browsers and many media applications.

#### **Warning:**

- It is your responsibility to ensure that any access to and use of recordings complies with all laws and regulations regarding data privacy and recording of calls with third parties (for example GDPR regulations).

#### Procedure

1. Sort and filter the list of recordings to display the recording or recordings that you want to download. See [Applying a Recording Filter](#) on page 716.
  - To download a single recording, click on the  icon next to the recording.
  - To download a set of recordings:
    - a. Select the check box next to the recording or recordings that you want to download.
    - b. Click **Download**.
    - c. Enter a password for the zip file that will contain the recordings.
    - d. Click **Download**. The file or files are downloaded as single ZIP file containing all the selected recordings.
2. The remaining steps depend on the browser. It will display its normal options for downloading a file.

#### Related links

[Viewing Recordings](#) on page 716

---

## Deleting Recordings

You can manually delete recordings ahead of their automatic deletion. The deletion is recorded as part of the audit trail.

### Procedure

1. Sort and filter the list of recordings to display the recording or recordings that you want to delete. See [Applying a Recording Filter](#) on page 716.
2. Select the check box next to the recording or recordings that you want to download.
3. Click **Delete**.

## Archiving Recordings to the External Storage

If separate external storage has been configured (see [Configuring Connection to the Google Storage Bucket](#) on page 724), use the following process to copy existing recordings to that external store. Copied recordings are then viewed and managed via access to the external storage rather than through the user portal or web manager menus.

### Warning:

- It is your responsibility to ensure that any access to and use of recordings complies with all laws and regulations regarding data privacy and recording of calls with third parties (for example GDPR regulations).

### Procedure

1. Access your system's call recordings. See [Viewing Recordings](#) on page 716.
2. Select the calls that you want archived:
  - If you select any files using the check boxes, those are the files copied.
  - If you apply a filter but don't select any files, then all files matching the filter are copied.
  - Otherwise, all current recordings are copied.
3. Click **Archive Recordings** and then **Initiate**.
4. The progress of the file copying is shown.
  - To stop the copying process before it is complete, click **Abort**.
  - Following the process of copying, a listing file is also added to the external storage. See [The Archive Listing Page](#) on page 728.

# Chapter 64: Displaying the Recording Audit Trail

The audit trail allows you to see all activities by users of the recording library. For example, searches for, replaying of and download of recordings. For each event, the user name, date and time and the action are shown.

- Note that audit trail records are only kept for 180 days after which they are automatically deleted.
- Access is controlled by the user rights of the service user account used to log in to web manager. The account must be a member of a rights group that includes **External > Media Manager Standard** or **External > Media Manager Administrator** permission.

## Procedure

1. Click **Applications**.
2. Click **Media Manager Audit Trail**.
3. Use the filter options to select what information you want displayed.
4. Set a **Start Date** and time, and an **End Date** and time. All four values must be set.
5. Click on **Event Type** and select the events that you want included in the audit trail. The options are:
  - **Configuration, Delete, Download, Login, Logout, Replay, Search.**
6. Click **Apply Filter** to display the matching audit trail records.

## Related links

[Exporting the Audit Trail](#) on page 721

---

## Exporting the Audit Trail

The currently displayed audit trail can be exported as a CSV file within a zipped and password protected file.

## Procedure

1. Apply a filter to display the audit trail records required.

2. Click **Export**.
3. Enter a password. This is used to restrict access to zip file that will contain the audit trail.
4. Click **Export**.
5. The file is downloaded by the browser.

**Related links**

[Displaying the Recording Audit Trail](#) on page 721

# Chapter 65: Archiving Recordings to External Storage

Centralized Media Manager automatically deletes each recording after a set number of days. By default that is 30 days. You can increase the retention period to up to 365 days. See [Setting How Long Recordings are Kept](#) on page 713.

If longer term storage is required, this can be done by configuring external storage.

- Currently the only external storage supported is within a Google Storage bucket. This requires knowledge of configuring and managing Google Storage which is not included in this manual.
- Files that are archived are copied from those currently in the voice recording library. The originals remain available in the library until manually or automatically deleted from it.
- During the process of copying recordings to the external storage, the system also creates a HTML file which can be used to view, sort and playback the recordings in the external storage, see [The Archive Listing Page](#) on page 728.
- Access to and use of the list file needs to be configured by the Google Storage bucket administrator, see [Allowing Access to the External Storage by Other Users](#) on page 727.

## **Warning:**

- It is your responsibility to ensure that any access to and use of recordings complies with all laws and regulations regarding data privacy and recording of calls with third parties (for example GDPR regulations).

## Configuring Connection to the Google Storage Bucket

### Before You Begin

This process requires you to have a JSON key file. The key file contains details required for the system to access the Google Storage.

- For details of exporting a key file, see [Google Documentation](#).
- JSON key files are available in two format. The format depends on whether the file was created from the Google Control Panel (GCP)/command line or using the REST API. The GCP/command line format should be used. The file should look similar to the following.

```
{
  "type": "service_account",
  "project_id": "[PROJECT-ID]",
  "private_key_id": "[KEY-ID]",
  "private_key": "-----BEGIN PRIVATE KEY-----\n[PRIVATE-KEY]\n-----END PRIVATE KEY-----\n",
  "client_email": "[SERVICE-ACCOUNT-EMAIL]",
  "client_id": "[CLIENT-ID]",
  "auth_uri": "https://accounts.google.com/o/oauth2/auth",
  "token_uri": "https://accounts.google.com/o/oauth2/token",
  "auth_provider_x509_cert_url": "https://www.googleapis.com/oauth2/v1/certs",
  "client_x509_cert_url": "https://www.googleapis.com/robot/v1/metadata/x509/[SERVICE-ACCOUNT-EMAIL]"
}
```

### Process

1. Access **System Settings > System > Recording Archival Configuration**.
2. Enter the **Bucket Name**.
3. Enter the name for the folder that should be used within the bucket for the recordings.
4. Use the **Service Account Details** settings to upload the JSON key file for the bucket.
5. Click on **Test Connection** and wait for confirmation.
6. If successful, click **Save Configuration**.
7. Click **Update**.

## Archiving Recordings to the External Storage

If separate external storage has been configured (see [Configuring Connection to the Google Storage Bucket](#) on page 724), use the following process to copy existing recordings to that external store. Copied recordings are then viewed and managed via access to the external storage rather than through the user portal or web manager menus.

 **Warning:**

- It is your responsibility to ensure that any access to and use of recordings complies with all laws and regulations regarding data privacy and recording of calls with third parties (for example GDPR regulations).

**Procedure**

1. Access your system's call recordings. See [Viewing Recordings](#) on page 716.
2. Select the calls that you want archived:
  - If you select any files using the check boxes, those are the files copied.
  - If you apply a filter but don't select any files, then all files matching the filter are copied.
  - Otherwise, all current recordings are copied.
3. Click **Archive Recordings** and then **Initiate**.
4. The progress of the file copying is shown.
  - To stop the copying process before it is complete, click **Abort**.
  - Following the process of copying, a listing file is also added to the external storage. See [The Archive Listing Page](#) on page 728.

## Google Administrator Access to the External Storage

**About this task**

Once some recordings have been copied to the external storage (see [Archiving Recordings to the External Storage](#) on page 719), you can access the archive file. When you have the file's URL, you can open the file in a browser window.

You can also share the file URL with other users once you setup permissions for them to access the folder contents.

**Procedure**

1. Log into the Google Cloud Platform using the user account that was used to create the storage bucket.
2. If necessary, select the project under which the storage was created.
3. On the dashboard, locate **Resources** and click on **Storage**.
4. In the objects list, click on the bucket name.
5. Click on the name of the folder used to store the archived recordings.

6. Locate the `VRLArchiveRecordings.html` file. To speed up finding the file, enter `VRL` in the filter box to show only matching file names.

7. Click on the file name to display the file details.

8. The **Link URL** is the value needed for browser access to the list of recordings in the archive.
- **To open the page in the browser:** Right-click on the value and select **Open link in a new window**. The recordings listing page is displayed, see [The Archive Listing Page](#) on page 728. If required, bookmark the address for your future access.
  - **To copy the value in order to share it with another user:** Right-click on the value and select **Copy link address**. Paste the link into the email or document being prepared for the other user. Note that you need to create permissions for the other user to access the files. See [Allowing Access to the External Storage by Other Users](#) on page 727.

# Allowing Access to the External Storage by Other Users

## About this task

Other users can be granted permission to access the archives listing file. In order to do this, the user will need a Google user account.

Access then requires:

- The email address associated with the Google user account is added to the archive bucket's permissions.
- They access the archive using a browser which is logged in using the Google user account.

## Procedure

1. Follow the same process as used for the initial administrator access (see [Google Administrator Access to the External Storage](#) on page 725) to obtain the URL of the listing page.
2. Paste the **Link URL** into the document or email being prepared for sending to the other user.
3. Grant the users email account permission to access the archive folder.
4. In the objects list, click on the bucket name.
5. Click on the name of the folder used to store the archived recordings.
6. Select **Permissions**.
  - Note that the following is only an example. Google storage supports a range of methods and levels at which permissions can be granted. However, in all cases, ensure that the permissions cover access to all the files in the storage folder and any sub-folders.
7. Select **Add members**.
  - a. In **New Members**, enter the email address of the user's Google account.
  - b. From **Select a role**, select `Storage Legacy | Storage Bucket Reader`.
  - c. Click **Save**.
8. Locate the `VRLArchiveRecordings.html` file. To speed up finding the file, enter `VRL` in the filter box to show only matching file names.
9. Click on the file name to display the file details.
10. The **Link URL** is the key value required. Right-click on the value and select **Copy link address**. Paste the link into the email or document being prepared for the other user. Note that you need to create permissions for the other user to access the files.
11. Send the details for accessing the listings file to the user.

## Related links

[Archiving Recordings to External Storage](#) on page 723

## The Archive Listing Page

In order to access the archive listing, you need to be log in with a Google user account that has been granted permission to access the archive folder. See [Allowing Access to the External Storage by Other Users](#) on page 727.

A link for the archive is shown on the **Voice Recordings Library** page. When opened, the archive listing page defaults to showing the recordings in date order.

# Part 11: Configuring Systems

# Chapter 66: Subscriptions

Subscriptions are monthly paid entitlements. They can be divided into two main groups;

- per-user per-month user subscriptions
- per-month application subscriptions for selected applications.

In practice, subscriptions are purchased for a specific duration. For example; 6-months, 1-year, 3-years.

During operation:

- If connection to the subscription server is lost, the IP Office system continues running with the existing subscription entitlements it has already received for 30-days.
- If when connected, any subscription expires, the feature or features associated with the expired subscriptions cease operation immediately.
  - The person responsible for ordering subscriptions must ensure that they are aware of subscription expiry dates. They must renew subscriptions in a timely manner, including time for renewal orders to be processed.

## Related links

[Ordering Subscriptions](#) on page 730

[Subscription Network Requirements](#) on page 735

[Subscription Mode Ports](#) on page 736

[Migrating Existing IP Office Systems to Subscription Mode](#) on page 737

---

## Ordering Subscriptions

Subscription for an IP Office subscription mode system are ordered from the Avaya Channel Marketplace. The subscriptions are ordered against the PLDS ID of the IP Office system.

After ordering the subscriptions, details of the customer number and address of the subscription server are supplied in an email. Those details are required during the initial system configuration.

- The person responsible for ordering subscriptions must ensure that they are aware of subscription expiry dates. They must renew subscriptions in a timely manner, including time for renewal orders to be processed.

#### Related links

[Subscriptions](#) on page 730

---

## Trial Mode

When ordering an IP Office subscription system through the Avaya Channel Marketplace, trial mode can be selected. Trial mode enables the IP Office to operate for up to 30-days using free subscriptions.

- The trial mode IP Office system indicates that it is in 30-day subscription error mode in applications such as the System Status Application and through system alarms.
- Before the 30-day trial period ends, the subscriber can return to Avaya Channel Marketplace and request a conversion to paid-subscriptions mode.

#### Important:

- To avoid any interruptions to customer telephony services, you must request the change to paid-subscriptions before the end of the 30-day trial period. That request must include allowance for sufficient working time to implement the request.

#### Related links

[Subscriptions](#) on page 730

---

## User Subscriptions

Each user on the system requires a subscription. All subscribed users are then able to use an the system's telephone extension (analog, digital or IP) and voicemail features. The following user subscriptions can be ordered: **Telephony User**, **Telephony Plus User** and **Unified Communications User**. The subscriptions are applied to individual users through their **User Profile** setting.

| Feature               | Subscription Mode |                     |                             |

- By default, users on a new or defaulted system are configured a **Telephony User** users.
- Users without a subscription are shown as **Non-licensed User** and cannot use any system features.
- If there are insufficient subscriptions for the number of users configured to a particular profile, some of those users will not receive any services. On suitable Avaya phones, they display as logged out and an attempt to log in displays a no license available warning.

1. Only supports Avaya Workplace Client basic mode (telephony and local contacts only).

## Application Subscriptions

The following application subscriptions can be ordered for a IP Office subscription system:

| Subscription                       | Description                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Receptionist Console</b>        | This subscription is used to enable the IP Office SoftConsole application to answer and redirect calls. The number of subscriptions allows the matching number of users to be configured as IP Office SoftConsole users. Those users still require a user subscriptions for their telephone connection (IP Office SoftConsole is not a softphone). |
| <b>Avaya Call Reporter</b>         | This subscription enables support for the Avaya Call Reporter application, hosted on a separate server.                                                                                                                                                                                                                                            |
| <b>Avaya Contact Center Select</b> | This subscription enables support the Avaya Contact Center Select (ACCS) service hosted on a separate server.                                                                                                                                                                                                                                      |

*Table continues...*

| Subscription           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Media Manager</b>   | <p>This subscription enables support for Media Manager. This can either be locally hosted on an IP Office Application Server or provided centrally by the same cloud-based servers providing the system's subscriptions. In either case:</p> <ul style="list-style-type: none"> <li>• A local Voicemail Pro service running on an IP Office Application Server is used to do the actual recording.</li> <li>• The recordings are then collected by the Media Manager service for archiving.</li> <li>• This option is not supported if using voicemail provided by a Unified Communications Module.</li> </ul> |
| <b>Third-Party CTI</b> | <p>This subscription enables support for CTI connections by third-party applications. This includes DevLink, DevLink3, Third-party TAPI and TAPI WAV.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Customer Operations Manager (COM)

IP Office subscription services are a set of cloud-based services provided by Avaya to support IP Office subscription systems. A separate set of these services is provided for each geographic region to support Avaya business partners and their customer systems in that region.

The key service is Customer Operations Manager (COM). COM provides:

- Subscriptions to the IP Office systems.
- Displays the status of the IP Office systems and information about current alarms, type of system, software level.
- Each business partner has an account that allows them to access COM but only see their own customer's systems. They can create additional COM user accounts and control which of their customer systems those accounts can see.
- Avaya have access to COM for their support staff in order to manage the COM services and to assist business partners when required.
- COM can provide the files used to customize various features such as phone background and screen saver images. This can be configured to provide common files to all the business partner's systems or individual files to individual end-customer systems.
- COM can act as the file server for firmware files used by Vantage phones and Avaya Workplace Client.
- For full documentation of COM, refer to the *Using Customer Operations Manager for IP Office Subscription Systems* manual.

**Additional Support Features**

A number of additional support services can be enabled through settings in the IP Office system configuration.

| Feature                       | Description                                                                                                                                                                                                                              |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Remote Backup/Restore</b>  | Subscription systems can automatically upload daily backups to the cloud. In addition, COM operators can perform both manual backups and restores operation                                                                              |
| <b>Remote Upgrade</b>         | Avaya provide COM with updated IP Office software images. COM operators can use these to perform immediate or scheduled system upgrades.                                                                                                 |
| <b>Log File Collection</b>    | Subscriptions systems can automatically upload all available log files to the cloud each day.                                                                                                                                            |
| <b>Centralized Management</b> | Administrator connections for IP Office Web Manager, SysMonitor and System Status Application can be routed through COM to the customer's IP Office systems. The connects use the TLS tunnel used for the subscriptions.                 |
| <b>Remote Access</b>          | Connections for HTTPS and SSH/SFTP connection can also be routed through COM to the customer IP Office systems. The connects use the TLS tunnel used for subscription.                                                                   |
| <b>Co-located Servers</b>     | When remote access is enabled, access to other servers and services on the same network as the customer IP Office system can be enabled. That includes access to non-IP Office servers and services subject to their own authentication. |

## Subscription Connection Operation

The connection between the IP Office and COM operates are follows:

**Outgoing Connection**

For the connection from the IP Office to COM:

- The destination is a single static IP address resolved by DNS of the subscription server address entered during the system's initial configuration.
- The IP Office alternates between TCP ports 443 and 8443 until successful.
- The link uses the HTTP 'WebSocket' protocol and TLS 1.2 with mutual authentication.
- The link carries a regular heartbeat, subscription information and basic details of the IP Office system (type of servers and software version).
- All other traffic on the link is controlled by the IP Office system settings; there are no access controls elsewhere.
- If the link is interrupted, the IP Office system goes into a 30-day error mode with daily alarms.
  - If connection to the subscription server is lost, the IP Office system continues running with the existing subscription entitlements it has received for 30-days.
    - During the error mode period, all operations and features are unaffected. The system outputs daily alarms in the system logs.
    - Successful reconnection clears the alarms and error mode.
    - If the 30-day error mode period expires, all subscription features and telephony are deactivated.

- If when connected, any subscriptions expire, the feature or features associated with the expired subscriptions cease operation immediately.
- • The person responsible for ordering subscriptions must ensure that they are aware of subscription expiry dates. They must renew subscriptions in a timely manner, including time for renewal orders to be processed.

### Incoming Connection

All incoming traffic from COM is routed to the IP Office through the existing subscription connection established above. It should not require any additional configuration on the customer network if the system has successfully obtained its subscriptions.

## Subscription Network Requirements

In order to obtain its subscriptions and to be remotely monitored and managed through COM, the IP Office system requires the following:

| Feature                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                  |       |                   |         |                |         |                           |                                                                    |                    |                                                                                        |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|-------|-------------------|---------|----------------|---------|---------------------------|--------------------------------------------------------------------|--------------------|----------------------------------------------------------------------------------------|
| <b>Subscription details</b> | <p>Details of the customer ID and subscription server address are provided by email. Those details are entered during the system's initial configuration.</p> <ul style="list-style-type: none"> <li>• For an IP500 V2 SCN, each IP500 V2 requires a License Server Link.</li> <li>• For a Server Edition deployment, only the Primary server has a License Server Link.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                  |       |                   |         |                |         |                           |                                                                    |                    |                                                                                        |
| <b>Internet access</b>      | <p>The system needs to be able to access the external internet. This is normally achieved during initial configuration of the system by entering the default gateway address of the outgoing router on the customer network.</p> <ul style="list-style-type: none"> <li>• That value is used to configure a default IP route in the system configuration with the following settings:</li> </ul> <table> <tr> <th>IP Route Setting</th><th>Value</th></tr> <tr> <td><b>IP Address</b></td><td>0.0.0.0</td></tr> <tr> <td><b>IP Mask</b></td><td>0.0.0.0</td></tr> <tr> <td><b>Gateway IP Address</b></td><td>The address of the external network router on the customer network</td></tr> <tr> <td><b>Destination</b></td><td>The IP Office LAN interface (LAN1 or LAN2) which is connected to the customer network.</td></tr> </table> <ul style="list-style-type: none"> <li>• Maximum round trip delay 200ms.</li> <li>• Minimum connection bandwidth 128kbits/s.</li> <li>• If the customer firewall or router controls the ports used for outgoing internet access, ensure that outgoing HTTPS traffic on TCP ports 8443 and 443 are allowed.</li> </ul> | IP Route Setting | Value | <b>IP Address</b> | 0.0.0.0 | <b>IP Mask</b> | 0.0.0.0 | <b>Gateway IP Address</b> | The address of the external network router on the customer network | <b>Destination</b> | The IP Office LAN interface (LAN1 or LAN2) which is connected to the customer network. |

## Migrating Existing IP Office Systems to Subscription Mode

The process for migrating an existing IP Office Essential Edition or Preferred Edition system to IP Office system can be performed by rerunning the initial configuration menu. The assumed mapping of existing user profiles to their subscription equivalents is as follows:

| Essential/Preferred Edition Mode | Subscription Mode |
|----------------------------------|-------------------|
| Non-Licensed User                | Non-Licensed User |
| Basic User                       | Telephony User    |
| Mobile User                      |                   |
| Office Worker                    | UC User           |
| Power User                       |                   |

## Centralized System Directory

Directory services can be used to import directory records (names and numbers) from external sources. These sets of records are regularly re-imported.

Directory records can come from the following sources:

- **LDAP Import:** The system can import LDAP records for use within directories shown by user phones and applications. LDAP import is configured through the **System Settings > System > Directory Services > LDAP** form. You can use LDAP Version 2 and 3.
- **HTTP Import :** Systems are able to import the directory records from another system using HTTP. HTTP import is configured through the **System Settings > System > Directory Services > HTTP** form by specifying an IP address or multi-site network connection. The records imported can be any or all of the following record types held by the system from which the records are being imported: LDAP imported records, HTTP imported records, configuration records.
- **System Directory Records (Configuration records):** Records can be entered directly into the system configuration through the **System Settings > System Directory > Add/Edit Directory Entry** form. System directory records override matching LDAP/HTTP imported records.

Users with system phone rights (see [System Phone Features](#) on page 850) and a phones with a **CONTACTS** button can add, delete and edit the system directory records of the system on which they are logged in. They cannot edit LDAP or HTTP imported records.

## Server Edition Directory Operation

For a Server Edition network, these settings can only be configured at the network level and they are stored in the configuration of the Primary Server. All other systems in the network are configured to share the directory settings of the Primary Server through the settings at **System Settings > System > Directory Services > HTTP**.

## Directory Record Capacity

The directory capacity depends on the type of system. The figures below are applicable for Release 10.0.

|                    | System                | Number of Directory Records |             |             | Total Number of Directory Records |
|--------------------|-----------------------|-----------------------------|-------------|-------------|-----------------------------------|
|                    |                       | Configuration               | LDAP Import | HTTP Import |                                   |
| Standalone Systems | IP500 V2              | 2,500                       | 10,000      | 10,000      | 10,000                            |
| Server Edition     | Primary Server        | 10,000                      | 10,000      | 10,000      | 10,000                            |
|                    | Secondary Server      | –                           | –           | 10,000      | 10,000                            |
|                    | Expansion System (L)  | –                           | –           | 10,000      | 10,000                            |
|                    | Expansion System (V2) | –                           | –           | 10,000      | 10,000                            |

## Directory Dialing

Directory numbers and names are displayed by user applications such as SoftConsole. The method by which these directories are searched and used depends on the application. Refer to the appropriate user guide.

Directory entries used for dialing can contain **()** and **—** characters in the number. Those characters are ignored in the dialled output. Directory entries containing **?** in the number (used for directory name matching) are not included in the directory for dialing.

Directory names are also viewable through the **Dir** or **Contacts** function on many Avaya phones. They allow the user to select the name in order to dial its associated number.

The directory function groups directory records shown to the phone user into several categories, for example; system, personal, users and groups. Depending on the phone or application, the user may be able to select the category currently displayed. In some scenarios, the categories displayed may be limited to those supported for the action being performed by the user. The typical categories are:

- **External:** Directory records from the system configuration. This includes HTTP and LDAP imported records.
- **Groups:** Groups on the system. If the system is in a multi-site network, it will also include groups on other systems in the network.
- **Users or Index:** Users on the system. If the system is in a multi-site network it will also include users on other systems in the network.
- **Personal:** Available on 1400, 1600, 9400, 9500, 9600, and J100 Series phones. These are the user's personal directory records stored within the system configuration.

On phones that support **Dir** or **Contacts**, the user can filter the currently displayed set of directory names by dialing on their keypad. Additional dialing applies a progressive filter. For example, if the user presses the 5 key (JKL), only names with some part beginning with J, K or L remain listed. If the user then presses the 2 key (ABC), only names with some part beginning with JA, JB, JC, KA, etc. remain listed. As the users presses more keys on their phone, the number of remaining matches reduces.

By default the letter matching is performed simultaneously against all parts of the directory name, ie. first, middle and last name. However, this behavior can be modified for all users using a NoUser source number.

## Speed Dialing

On M-Series and T-Series phones, a **Speed Dial** button or dialing **Feature 0** can be used to access personal directory records using the record's index number.

- **Personal:** Dial **Feature 0** followed by \* and the 2-digit index number in the range 01 to 99.
- **System:** Dial **Feature 0** followed by 3-digit index number in the range 001 to 999.
- The **Speed Dial** short code feature can also be used to access a directory speed dial using its index number from any type of phone.

## Caller Directory Name Matching

Directory records are also used to associate a name with the dialled number on outgoing calls or the received CLI on incoming calls. When name matching is being done, a match in the user's

personal directory overrides any match in the system directory. Note that some user applications also have their own user directory.

- The ( ) and — characters are not used for directory name matching. Directory entries with those characters are ignored for name matching.
- A ? character can be used to match any digit or digits. For example 91?3 will match 9123. Typically a single ? is used at the end of a known dialing string such as an area code.
- The best match is used, determined by the highest number of matched digits.
- There is no minimum number of matches. For example, a directory entry of 9/External can be used to match any external call unless it has a better match.

### Other Name Sources

- SoftConsole has its own directories which are also used for name matching. Matches in the application directory can lead to the application displaying a different name from that shown on the phone.
- Name matching is not performed when a name is supplied with the incoming call, for example QSIG trunks. On SIP trunks the use of the name matching or the name supplied by the trunk can be selected using the **Default Name Priority** setting (**System | Telephony | Telephony**). This setting can also be adjusted on individual SIP lines to override the system setting.
- Directory name matching is not supported for DECT handsets. For information on directory integration, see *Deploying Avaya Wireless DECT with IP Office*.

### Imported Records

Imported directory records are temporary until the next import refresh. They are not added to the system's configuration. They cannot be viewed or edited using Manager or edited by a system phone user. The temporary records are lost if the system is restarted. However the system will request a new set of imported directory records after a system restart. The temporary records are lost if a configuration containing Directory changes is merged. The system will then import a new set of temporary records without waiting for the **Resync Interval**. If an configuration record is edited by a system phone user (see [System Phone Features](#) on page 850) to match the name or number of a temporary record, the matching temporary record is discarded.

### Importation Rules:

When a set of directory records is imported by HTTP or LDAP, the following rules are applied to the new records:

- Imported records with a blank name or number are discarded.
- Imported records that match the name or number of any existing record are discarded.
- When the total number of directory records has reached the system limit, any further imported records are discarded.

For capacity information, see the description for the **Directory** tab.

[General System Configuration](#) on page 738

## Advice of Charge

The system supports advice of charge (AOC) on outgoing calls to ISDN exchanges that provide AOC information. It supports AOC during a call (AOC-D) and at the end of a call (AOC-E). This information is included in the SMDR output.

AOC is only supported on outgoing ISDN exchange calls. It is not supported on incoming calls, reverse charge calls, QSIG and non-ISDN calls. Provision of AOC signalling will need to be requested from the ISDN service provider and a charge may be made for this service.

The user who makes an outgoing call is assigned its charges whilst they are connected to the call, have the call on hold or have the call parked.

- If AOC-D is not available, then all charges indicated by AOC-E are assigned to the user who dialed the call.
- If AOC-D is available:
  - If the call is transferred (using transfer, unpark or any other method) to another user, any call charges from the time of transfer are assigned to the new user.
  - If the call is manually transferred off-switch, the call charges remain assigned to the user who transferred the call.
  - If the call is automatically forwarded off switch, subsequent call charges are assigned to the forwarding user.
  - AOC-D information will only be shown whilst the call is connected. It will not be shown when a call is parked or held.
  - Call charges are updated every 5 seconds.

For conference calls all call charges for any outgoing calls that are included in the conference are assigned to the user who setup the conference, even if that user has subsequently left the conference.

### Enabling AOC Operation

1. **Set the System Currency** The Default Currency (System | Telephony | Telephony) setting is by default set to match the system locale. Note that changing the currency clears all call costs stored by the system except those already logged through SMDR.
2. **Set the Call Cost per Charge Unit for the Line** AOC can be indicated by the ISDN exchange in charge units rather than actual cost. The cost per unit is determined by the system using the **Call Cost per Charge Unit** setting which needs to be set for each line. The values are 1/10,000th of a currency unit. For example if the call cost per unit is £1.07, a value of 10700 should be set on the line.
3. **Applying a Call Cost Markup** It may be a requirement that the cost applied to a user's calls has a mark-up (multiplier) applied to it. This can be done using the Call Cost Markup (User | Telephony | Call Settings) setting. The field is in units of 1/100th, for example an entry of 100 is a markup factor of 1.

[General System Configuration](#) on page 738

---

## Using Locations

Locations are used to apply an number of common settings to lines and extensions that are in the same physical location. For example:

- Apply restrictions to the number of simultaneous calls on internal trunks between different IP Office systems. See [Configuring Call Admission Control](#) on page 831.
- Set the outgoing ARS that should be used when an extension associated with the location makes an emergency call. The aim being to ensure that emergency calls use trunks that match their physical location or using a caller ID number registered to the location. See [Configuration for Emergency Calls](#) on page 776.

For SIP trunks, emergency calls can include sending the address information configured for the dialing extension's location.

- Apply location specific time offset settings to the time display on phones in the location.

### Related links

[General System Configuration](#) on page 738

---

## Caller Display

Caller display displays details about the caller and the number that they called. On internal calls, the system provides this information. On external calls it uses the Incoming Caller Line Identification (ICLID) received with the call. The number is also passed to system applications and can be used for features such as call logging, missed calls and to make return calls.

Analog extension can be configured for caller display via the system configuration (Extension | Extn | Caller Display Type).

**Adding the Dialing Prefix** Some systems are configured to require a dialing prefix in front of external numbers when making outgoing calls. When this is the case, the same prefix must be added to the ICLID received to ensure that it can be used for return calls. The prefix to add is specified through the Prefix field of each line.

**Directory Name Matching** The system configuration contains a directory of names and numbers. If the ICLID of an incoming call matches a number in the directory, the directory name is associated with that call and displayed on suitable receiving phones.

Applications such as SoftConsole also have directories that can be used for name matching. If a match occurs, it overrides the system directory name match for the name shown by that application.

### Extended Length Name Display

In some locales, it may be desirable to change the way names are displayed on phones in order to maximize the space available for the called or calling name. There are two hidden controls which can be used to alter the way the system displays calling and called information.

These controls are activated by entering special strings on the Source Numbers tab of the NoUser user. These strings are:

**LONGER\_NAMES** This setting has the following effects:

- On DS phones, the call status display is moved to allow the called/calling name to occupy the complete upper line and if necessary wrap-over to the second line.
- For all phone types:
- On incoming calls, only the calling name is displayed. This applies even to calls forwarded from another user.
- On outgoing calls, only the called name is displayed.

**HIDE\_CALL\_STATE** This settings hides the display of the call state, for example **CONN** when a call is connected. This option is typically used in conjunction with **LONGER\_NAMES** above to provide additional space for name display.

[General System Configuration](#) on page 738

---

## Parking Calls

Parking a call is an alternative to holding a call. A call parked on the system can be retrieved by any other user if they know the system park slot number used to park the call. When the call is retrieved, the action is known as Unpark Call or Ride Call. While parked, the caller hears music on hold if available.

Each parked call requires a park slot number. Attempting to park a call into a park slot that is already occupied causes an intercept tone to be played. Most park functions can be used either with or without a specified park slot number. When parking a call without specifying the park slot number, the system automatically assigns a number based on the extension number of the person parking the call plus an extra digit 0 to 9. For example if 220 parks a call, it is assigned the park slot number 2200, if they park another call while the first is still parked, the next parked call is given the park slot number 2201 and so on.

Park slot IDs can be up to 9 digits in length. Names can also be used for application park slots.

The **Park Timeout** setting in the system configuration (System | Telephony | Telephony | Park Timeout) controls how long a call can be left parked before it recalls to the user that parked it. The default time out is 5 minutes. Note that the recall only occurs if the user is idle has no other connected call.

There are several different methods by which calls can be parked and unparked. These are:

Using Short Codes

The short code features, Call Park and Unpark Call, can be used to create short codes to park and unpark calls respectively. The default short codes that use these features are:

- \*37\*N# - Parks a call in park slot number N.
- \*38\*N# - Unparks the call in park slot number N.

#### Using the SoftConsole Application

The SoftConsole application supports park buttons. SoftConsole provides 16 park slot buttons numbered 1 to 16 by default.

The park slot number for each button can be changed if required. Clicking on the buttons allows the user to park or unpark calls in the park slot associated with each button. In addition, when a call is parked in one of those slots by another user, the application user can see details of the call and can unpark it at their extension.

#### Using Programmable Buttons

The Call Park feature can be used to park and unpark calls. If configured with a specified park slot number, the button can be used to park a call in that slot, unpark a call from that slot and will indicate when another user has parked a call in that slot. If configured without a number, it can be used to park up to 10 calls and to unpark any of those calls.

#### Phone Defaults

Some telephones support facilities to park and unpark calls through their display menu options (refer to the appropriate telephone user guide). In this case parked calls are automatically put into park slots matching the extension number.

#### Related links

[General System Configuration](#) on page 738

---

## Automatic Intercom Calls

Automatic intercom functions allow you to call an extension and have the call automatically answered on speaker phone after 3 beeps. The extension called must support a handsfree speaker. If the extension does not have a handsfree microphone then the user must use the handset if they want to talk. If the extension is not free when called, the call is presented as a normal call on a call appearance button if available.

### Making Automatic Intercom Calls

The following programmable button functions can be used to make automatic intercom calls:

- **Automatic Intercom**
- **Dial Direct**
- **Dial Intercom**

The following short code function can be used to make automatic intercom calls:

#### Dial Direct

On M-Series and T-Series phones, the code **Feature 66** followed by the extension number can be used to make a direct voice (automatic intercom) call.

### Deny automatic intercom calls

When enabled, any automatic intercom calls to the user's extension are automatically turned into normal calls.

Deny automatic intercom calls can be configured per user on the **User | Telephony | Supervisor Settings** tab. Deny automatic intercom call can also be enabled using the Auto Intercom Deny On short code or the Auto Intercom Deny button action.

## Wide Band Audio Support

IP Office systems support the G.722 64K codec for wide band audio. G.722 can be used with H.323 and SIP trunks. It can also be used with some SIP and H.323 IP telephones (see below). G.722 uses a higher speech sample rate (16KHz) than is used by most other audio codecs (8KHz).

G.722 is only supported by systems that are using IP500 VCM, IP500 VCM V2 and or IP500 Combination cards.

### Avaya Phone Support

Use of G.722 is supported by the following Avaya phones on a IP Office system: 1100/1200 Series, 9600 Series, J100 Series, B179, B199.

### Using the G.722 Codec

The G.722 codec is not available for use by default. If the codec is to be used, it must first be selected in the system's **Available Codecs** list (System | Codecs). The codec can then be used in the system's default codec preference list and or in the individual codec preferences of IP lines and extensions.

The method of codec selection for specific phones will depend on the phone type. Refer to the appropriate installation manual.

### Conferencing

Where devices using G.722 are in a system conference, the system can attempt to ensure that the speech between devices using G.722 remains wide-band even if there are also narrow-band audio devices in the same conference. This is done if the system's High Quality Conferencing option is enabled (**System | Telephony | Telephony**).

### Known Limitations

The following limitations apply to G.722 wide band audio operation:

- Call recording uses G.711.
- Page calls only use G.722 when all devices being paged can use G.722.

- Fax is not supported in G.722, use G.711 or T38.
- Soft tones provided by the system use G.711.
- A maximum of 15 G.722 devices receiving wide-band audio are supported in conferences.

[General System Configuration](#) on page 738

---

## Media Connection Preservation

Media Connection Preservation maintains calls that experience end-to-end signalling loss or refresh failures but that still have an active media path.

**IP Phones:**

With IP Office 9.1 and higher, the following Avaya IP phones attempt to maintain calls when the signal from the host IP Office is lost.

- 9608
- 9611
- 9621
- 9641
- J100 Series

When preserving a call, the phone does not attempt to reregister with their call server or attempt to failover to a standby call server, until the call has ended. Softkey call actions and feature menus do not work during this time due to the loss of signalling path. The phone display is not updated and the only permitted action is to terminate the call.

**IP Office:**

When enabled for a particular IP endpoint type that supports Media Connection Preservation, the call is put into a Preserved state and a Preservation Interval timer is started for that call at the point the signalling loss is detected. The maximum duration of a preserved call on IP Office is two hours. Once put into the Preserved state, a call can only transition to the Terminated state. Call restoration is not supported.

Only the following call types are preserved:

- Connected active calls
- Two party calls where the other end is a phone, trunk, or voicemail
- Conference calls
- Calls on hold and calls to hunt groups are not preserved.

**Phone Display:**

When a call is in a preserved state but the phone's local signalling connection with its host IP Office is still present, the phone call state display is prefixed with a warning icon. Hold, transfer, and conference actions are not available.

## System Configuration

When enabled on **System Settings > System > Telephony**, Media Connection Preservation is applied at a system level to SCN trunks and Avaya H.323 phones that support connection preservation. All systems in a Small Community Network (SCN) must be enabled for end to end connection preservation to be supported.

When enabled on **System Settings > Line > Add/Edit Trunk Line > SIP Line > SIP Advanced**, Media Connection Preservation is applied to the SIP trunk. The value of connection preservation on public SIP trunks is limited. Media Connection Preservation on public SIP trunks is not supported until tested with a specific service provider. Media Connection Preservation is disabled by default for SIP trunks.

When enabled on **System Settings > Line > Add/Edit Trunk Line > SM Line > Session Manager**, Media Connection Preservation is applied to Enterprise Branch deployments. Media Connection Preservation preserves only the media and not the call signaling on the SM Line. Media Connection Preservation does not include support for the Avaya Aura Session Manager Call Preservation feature.

## Configuring IP Routes

The IP Office system acts as the default gateway for its DHCP clients. You can also specify the IP Office as the default gateway statically addressed devices on the same subnet as the IP Office. When those clients and devices want to send data to an IP address on a different subnet, they will send that data to the IP Office system for onward routing.

### • IPv4 Static Routes

For IPv4 traffic, the IP Office can use the **System > IP Route** configuration settings to determine where to forward traffic. You can configure the following as destinations for IP Office static routes:

- **LAN1** - Direct the traffic to the IP Office system LAN1.
- **LAN2** - Direct the traffic to the IP Office system LAN2.
- **Service** - Direct the traffic to a service in the IP Office configuration. The service settings define the details to connect to a remote data service.
- **Tunnel** - Direct the traffic to an IPSec or L2TP tunnel in the IP Office configuration.

The IP Office system provides two methods of defining a default route for IP traffic that does not match any other specified routes.

- **Default Service** - Within the settings for services, one service can be set as the **Default Route (Service | Service)**.
- **Default IP Route** - Create an IP Route record with a blank IP Address, blank IP Mask, and set to the required destination for default traffic.

### • IPv6 Static Routes

Linux-based IP Office R12.1 systems can support IPv6. In that case, you can configure static routes for IPv6 traffic using the **System > IP Route (IPv6)** configuration settings.

- **IPv4 Dynamic Routes (RIP)**

IP500 V2 IP Office systems can support RIP (Routing Information Protocol). The IP Office can use RIP to automatically learn routes for data traffic from other routers that also support RIP.

- By default, static routes entered in the IP Office configuration override any dynamic routes learnt using RIP. This Favor RIP Routes over static routes (**System > System**) setting control this behavior.

## RIP Dynamic Routing

Routers in a network can use Routing Information Protocol (RIP) to automatically advertise details of the routes they know. Through this process, each router can automatically add new network devices to its routing table.

- Each router-to-router link a 'hop'. The routing table can contain routes with up to 15 hops. When more than one route to a destination exists, the IP Office adds the route with the lowest metric (number of hops) to its routing table.
- When an existing route becomes unavailable, after 5 minutes the router marks it as requiring 'infinite' (16) hops. The router advertises this to the network and then removes the route from its routing table.
- The IP Office system also uses 'split horizon' and 'poison reverse' to prevent routes that create loops.
- RIP is a simple method for automatic route sharing and updating within small homogeneous networks. It allows routers to advertise alternate routes when an existing route fails. Within a large network, the exchange of routing information every 30 seconds can create excessive traffic. In addition, the IP Office routing table is limited to 100 static, dynamic, and internal routes.
- When a static route and a dynamic route to the same destination have the same metric, the IP Office uses the static route.
- RIP does not include broadcast (255.255.255.255) and multicast (224.0.0.0) route.

## Creating a Virtual WAN Port Procedure

1. Select  **WAN Port**.
2. Click  and select **PPP**.

3. In the **Name** field, enter either **LINEx.y** where:

- **LINE** must be in uppercase.
- **x** is the line number. For a PRI/T1 module in Slot A, this will be 1. For a PRI/T1 module in Slot B, this will be 5.
- **y** is the lowest numbered channel number to be used by the WAN link minus 1. For example, if the lowest channel to be used is channel 1 then  $y = 1 - 1 = 0$ .

4. In the **Speed** field, enter the total combined speed of the maximum number of channels sets in the Service.

In this example, 12 channels x 64000 bits = 76800.

 **Note:**

The maximum number of channels that can be used will be limited by the number of data channels supported by the system Control Unit and not already in use.

5. In the **RAS Name** field, select the RAS name created when the new Service of that name was created.

6. Click **OK**.

# Chapter 68: On-boarding

On-boarding refers to the configuration of an SSL VPN service in order to enable remote management services to customers, such as fault management, monitoring, and administration. You must use the Web Manager client to configure on-boarding.

For full details on how to configure and administer SSL VPN services, refer to *Deploying Avaya IP Office™ Platform SSL VPN Services*.

The procedure provided below configures IP Office for Avaya support services. Avaya partners can also use an SSL VPN to provide support services.

## Related links

[Configuring an SSL VPN using an on-boarding file](#) on page 751

---

## Configuring an SSL VPN using an on-boarding file

The on-boarding XML file is available from Avaya. It contains the settings required to establish a secure tunnel between IP Office and an AVG server. When you import the on-boarding XML file, it applies the settings and installs one or multiple TLS certificates.

When you configure the SSL VPN service on a new system, you must begin by generating an inventory file of the IP Office system. When you register your IP Office system, the inventory file that you generated is uploaded to the GRT and the inventory data is populated in the Avaya Customer Support (ACS) database. After you enable remote support, you can download the XML on-boarding file from the GRT web site and upload it into your IP Office system.

The on-boarding process configures:

- SSL VPN service configuration
- short codes for enabling and disabling the SSL VPN service
- SNMP alarm traps
- one or more TLS certificates in the IP Office trusted certificate store

Perform this procedure using the Avaya IP Office Web Manager client.

**Warning:**

The process of 'on-boarding automatically creates an SSL VPN service in the system configuration when the on-boarding file is uploaded to the system. Care should be taken not to delete or modify such a service except when advised to by Avaya.

**Before you begin**

Before you begin, you must have the hardware codes and catalog description of your IP Office system. For example, "IP OFFICE 500 VERSION 2 CONTROL UNIT TAA" is a hardware code and catalog description.

**Procedure**

1. Select **Tools > On-boarding**.

The On-boarding dialog box displays.

2. If the hardware code for your IP Office system ends with the letters TAA, select the checkbox next to the prompt **Are you using TAA series hardware?**
3. Click **Get Inventory File** to generate an inventory of your IP Office system.
4. Click **Register IP Office**.

A browser opens and navigates to the GRT web site.

5. Log in to the web site and enter the required data for the IP Office system.
6. Select **Remote Support** for the IP Office system.
7. Click **Download** and save the on-boarding file.
8. Browse to the location where you saved the on-boarding file and click **Upload**.

A message displays to confirm that the on-boarding file has installed successfully.

# Chapter 69: Fax Support

## Fax on IP500 V2 Systems

IP500 V2 systems can terminate T38 fax calls. For a system with an IP500 VCM, IP500 VCM V2 or IP500 Combo cards, **T38** or **G.711** can be used for fax transmission. Each fax call uses a VCM channel unless it is a T38 fax call between compatibly configured call legs. A SIP line or extension must support Re-Invite.

**T38 Fallback** can also be specified. On outgoing fax calls, if the called destination does not support T38, a re-invite is sent for fax transport using **G.711**.

## Configuring Fax on SIP Lines and Extensions:

To configure Fax on SIP Lines and Extensions:

1. On the **VoIP** page for the line or extension, set **Re-Invite Supported** to **On** in order to enable **Fax Transport Support**
2. Select a value in the **Fax Transport Support** field.

Note the following:

- Direct media is supported.
- If **Fax Transport Support** is set to **T38** or **T38 Fallback**, the T38 Fax page is available. The T38 Fax page provides detailed T38 configuration options.

## Configuring Fax on an IP Office Line:

Within a multi-site network, **Fax Transport Support** can also be enabled on the IP Office Lines between the systems. This allows fax calls at one system to be sent to another system.

To configure Fax on an IP Office Line:

1. Set **IP Office Line | Line Settings | Networking Level** to **SCN**.
2. Set **IP Office Line | VoIP | Fax Transport Support** to **Fax Relay**.

## Related links

[Server Edition T38 Fax Support](#) on page 754

## Server Edition T38 Fax Support

□

### Fax on Server Edition Linux Servers

IP Office Linux servers cannot terminate T38 fax and therefore, T38 is negotiated end-to-end. When a SIP ATA fax is connected to an IP Office Linux server, the system directly relays negotiation between the SIP ATA Fax and the SIP provider.

#### Configuring Fax on SIP Lines and Extensions:

To configure Fax on SIP Lines and Extensions, on the **VoIP** page for the SIP line or extension:

1. Set **Re-Invite Supported** to **On** in order to enable **Fax Transport Support**.
2. Select a value in the **Fax Transport Support** field.

Note the following.

- Direct media is supported.
- The **T38 Fax** page is not available.

### Fax on Server Edition IP500 V2 Expansion Systems

Since an IP500 V2 system can terminate T38 fax, an analog fax can be connected to an IP500 V2 Expansion system. Fax transport is configured on the IP Office Line connecting the IP500 V2 system to the Server Edition network.

**Configuring Fax on an IP Office Line:**

To configure Fax on an IP Office Line, on the **Line | IP Office Line | VoIP Settings** page, select a value in the **Fax Transport Support** field. **Fax Relay** is not supported.

Note the following.

- Direct media is supported.
- The **T38 Fax** page is not available.

# Chapter 70: Paging

The IP Office supports flexible paging to any extensions that support auto-answer and also paging to external paging devices. However, no paging options are configured by default on a newly installed IP Office system.

## Paging Scenarios

| Paging Scenario                                                                       | Paged Device Connects to...            | Short Code/ Button Feature |
|---------------------------------------------------------------------------------------|----------------------------------------|----------------------------|
| <b>Phone to Phone</b><br>Simple paging to other system extensions.                    | Digital Station and Avaya H.323 Phones | <b>Dial Paging</b>         |
| <b>Mixed Paging</b><br>Simultaneous paging to phones and a paging speaker.            | Analog Extension (Paging Speaker)      | <b>Dial Paging</b>         |
| <b>Paging Interface Device</b><br>Paging to a paging interface device such as a UPAM. | Analog Extension (IVR Port)            | <b>Dial Extn</b>           |
|                                                                                       | Analog Trunk                           | <b>Dial</b>                |

[Paging to an External Paging Device](#) on page 757

[Mixed Paging](#) on page 758

---

## Paging Capacity

For full capacity details, refer to *Avaya IP Office™ Platform Guidelines: Capacity*.

| IP Office Type        | Paging Group Maximum size |
|-----------------------|---------------------------|
| Server Edition/Select | 512                       |
| IP500 V2              | 64                        |

- Paging groups that include users on a V2 Expansion are limited to 64 members.
- Paging groups that include SRTP endpoints, the maximum size is reduce by 50%.

**Related links**

[Paging](#) on page 756

---

## Phone to Phone Paging

- Paging is supported from all phone types. A page call can be to a single phone or a group of phones.
  - From analog and non-Avaya phones, use a Dial Paging short code.
  - From Avaya feature phones, a programmable button set to Dial Paging can be used.
- Paging is only supported to Avaya phones that support auto answer.
- The page is not heard on phones that are active on another call.
- The page is not heard on phones where the user is set to Do Not Disturb or has Forward Unconditional active.
- On Avaya phones with a dedicated **Conference** button, the user can answer a page call by pressing that button. This turns the page into a normal call with the pager.

**Related links**

[Paging](#) on page 756

---

## Paging to an External Paging Device

**Paging Interface Device**

Uses a paging interface device such as a UPAM or amplifier with analog trunk/extension interface. The device can be connected to an analog trunk port or analog extension port.

If connected to a trunk port:

- Use a short code set to **Dial** and the same **Line Group ID** as the **Outgoing Line ID** set for the analog trunk.

If connected to an extension port:

- Set the analog extension as an **IVR Port** in the system configuration (**Extn > Analog > Equipment Classification**).
- Use a short code or programmable button set to use **Dial Extn**.

## Related links

[Paging](#) on page 756

## Mixed Paging

Uses an amplifier connected to an analog extension port via a 600ohm isolating transformer. Some amplifiers include an integral transformer. Avaya/Lucent branded amplifiers are designed for connection to special paging output ports not provided on systems. They are not suitable for supporting mixed paging.

The transformer and amplifier must be connected when the system is restarted.

If background music is required between pages, the amplifier must support a separate background music connection and VOX switching.

The analog extension port is set as a Paging Speaker in the system configuration (**Extn | Analog | Equipment Classification**).

Short code/programmable button: Use DialPaging.

**Related links**

[Paging](#) on page 756

# Chapter 71: System Events

The system supports a number of methods by which events occurring on the system can be reported. These are in addition to the real-time and historical reports available through the System Status Application (SSA).

## SNMP Reporting

Simple Network Management Protocol (SNMP) allows SNMP clients and servers to exchange information. SNMP clients are built into devices such as network routers, server PC's, etc. SNMP servers are typically PC application which receive and/or request SNMP information. The system SNMP client allows the system to respond to SNMP polling and to send alarm information to SNMP servers.

In order for an SNMP server application to interact with a system, the MIB files provided with the Manager installation software must be compiled into the SNMP server's applications database.

### Note:

- The process of 'on-boarding' (refer to the *Deploying Avaya IP Office™ Platform SSL VPN Services*) may automatically configure SNMP and create a number of SNMP alarm traps. These will override any existing SNMP configuration settings.

## SMTP Email Reporting

The system can send alarms to an SMTP email server. Using SMTP requires details of a valid SMTP email account user name and password and server address. If SMTP email alarms are configured but for some reason the system cannot connect with the SMTP server, only the last 10 alarms are stored for sending when connection is successful. Use of SMTP alarms requires the SMTP server details to be entered in the SMTP tab.

## Syslog Reporting

The system can also send alarms to a Syslog server (RFC 3164) without needing to configure an SNMP server. In addition Syslog output can include audit trail events.

Multiple event destinations can be created, each specifying which events and alarms to include, the method of reporting to use (SNMP, Syslog or Email) and where to send the events. Up to 2 alarm destinations can be configured for SNMP, 2 for Syslog and 3 for SMTP email.

### Related links

[Configuring Alarm Destinations](#) on page 761

---

# Configuring Alarm Destinations

## About this task

The Alarms section of the System Events tab displays the currently created alarm traps. It shows the event destinations and the types of alarms that will trigger the send of event reports. Up to 2 alarm destinations can be configured for SNMP, 2 for Syslog and 3 for SMTP email.

## Procedure

1. In the navigation pane, select **System**.
2. In the details pane, select **System Events** and then select the **Alarms** sub-tab.
3. Use the **Add**, **Remove** and **Edit** controls to alter the traps.
4. Click **Add** or select the alarm to alter and then click **Edit**.
5. For a new alarm, set the **Destination** to either **Trap (SNMP)** or **Syslog** or **Email (SMTP)**.  

Note that once a destination has been saved by clicking **OK** it cannot be changed to another sending mode.
6. The remaining details will indicate the required destination information and allow selection of the alarm events to include.
7. When completed, click **OK**.
8. Click **OK** again.

# Chapter 72: Certificate Management

This section provides an overview of IP Office certificate support and management. For more comprehensive information, refer to the *Avaya IP Office™ Platform Security Guidelines* manual.

## Related links

[Certificate Overview](#) on page 762

[Certificate Support](#) on page 767

---

## Certificate Overview

Public key cryptography is one of the ways to maintain a trustworthy networking environment. A public key certificate (also known as a digital certificate or identity certificate) is an electronic document used to prove ownership of a public key. The certificate includes information about the key, information about its owner's identity, and the digital signature of an entity that has verified the certificate's contents are correct. If the signature is valid, and the person examining the certificate trusts the signer, then they know they can use that key to communicate with its owner.

The system used to provide public-key encryption and digital signature services is called a public key infrastructure (PKI). All users of a PKI should have a registered identity which is stored in a digital format and called an Identity Certificate. Certificate Authorities are the people, processes and tools that create these digital identities and bind user names to public keys.

There are two types of certificate authorities (CAs), root CAs and intermediate CAs. In order for a certificate to be trusted and for a secure connection to be established, that certificate must have been issued by a CA that is included in the trusted certificate store of the device that is connecting. If the certificate was not issued by a trusted CA, the connecting device then checks to see if the certificate of the issuing CA was issued by a trusted CA, and so on until either a trusted CA is found. The trusted certificate store of each device in the PKI must contain the required certificate chains for validation.

### IP Office Root Certificate Authority

IP Office generates a self-signed certificate. For IP500 V2 systems, a certificate is generated automatically on the first start up. On Linux systems, a certificate is generated during the ignition process.

The following entities can act as the certificate authority.

- The Server Edition Primary Server, an Application Server, or a Unified Communication Module (UCM) can act as the root certificate authority for all nodes in the system.
- In Enterprise Branch deployments, the System Manager can act as the root certificate authority.
- Identity certificates can also be purchased and issued by a third party certificate authority.

Regardless of the method used to provide the IP Office identity, the certificate authority which signs the IP Office identity certificate must be trusted by all the clients and endpoints that need to establish a secure connection with IP Office. They must be a part of the PKI. Therefore, the root CA certificate must be downloaded to client devices and placed in the trusted certificate store. If there are intermediate CAs in the certificate chain, either the intermediate CAs must be added to the client device Trusted Certificate Store or the certificate chain must be advertised by IP Office in the initial TLS exchange.

### Certificates and TLS

Telephony signaling like SIP messaging is secured using Transport Layer Security (TLS). TLS provides communication security using certificates to authenticate the other end of the IP Link.

The message exchange in TLS is aimed at verifying the identity of the communicating parties and establishing the keys that will be used to encrypt the signaling data between the two parties.

Typically, the server sends its identity certificate, either self-signed or signed by the CA, to the client. The client must have the CA certificate in its trusted certificate store.

IP Office acts as the TLS server in its interactions with SIP telephony clients. This means that the TLS application on the IP Office must be configured to listen for client connections by enabling TLS in the SIP Registrar on the LAN1 and LAN2 interfaces.

 **Note:**

- Authentication of the client's certificate by the server is not a requirement. IP Office does not support client certificate validation for all SIP endpoint types.
- The E.129 phone does not validate the IP Office identity certificate.

### Related links

[Certificate Management](#) on page 762

[Windows Certificate Store](#) on page 764

## Windows Certificate Store

The certificate store used by Manager to save and retrieve X509 certificates is the default one provided by the Windows operating system. The Windows certificate store is relevant to any application running on Windows that uses certificates for security, either TLS or HTTPS.

 **Warning:**

- Avaya accepts no responsibility for changes made by users to the Windows operating system. Users are responsible for ensuring that they have read all relevant documentation and are sufficiently trained for the task being performed.

### Windows Certificate Store Organization

By default, certificates are stored in the following structure:

Each of the sub folders has differing usage. The Certificates - Current User area changes with the currently logged-in Windows user. The Certificate (Local Computer) area does not change with the currently logged-in Windows user.

Manager only accesses some of the certificate sub folder:

| <b>Certificates (Local Computer) Folder</b>                  | <b>Manager Use</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Windows Certificate Store Import

In order to use certificates – either for security settings or Manager operation – they must be present in the Windows certificate store. Certificates may be placed in the store by the Certificate Import Wizard. The Certificate Import Wizard can be used whenever a certificate is viewed. In order for Manager to subsequently access this certificate the **Place all certificate in the following store** option must be selected:

- If the certificate is to subsequently identify the system, the Other People folder should be used.
- If the certificate is to subsequently identify the Manager, the Personal folder should be used, and the associated private key saved as well.

## Certificate Store Export

Any certificate required outside of the Manager PC must be first saved in the Certificate store, then exported.

If the certificate is to be used for identity checking (that is, to check the far entity of a link) the certificate alone is sufficient, and should be saved in PEM or DER format.

If the certificate is to be used for identification that is, to identify the near end of a link) the certificate and private key is required, and should be saved in PKCS#12 format, along with a password to access the resultant .pfx file.

## Certificate File Naming and Format

**DER:** Distinguished Encoding Rules (DER) format, which is a binary format used to represent a certificate. Typically used to describe just one certificate, and cannot include a private key.

There are four main encodings/internal formats for certificate files. Note that these are encodings, not file naming conventions.

**PEM:** Privacy Enhanced Mail (PEM) is a Base 64 (i.e. ASCII text) encoding of DER, one certificate is enclosed between '-----BEGIN CERTIFICATE-----' and '-----END CERTIFICATE-----' statements. Can contain a private key enclosed between '-----BEGIN PRIVATE KEY -----' and '-----END BEGIN PRIVATE KEY -----' statements. More than one certificate can be included. PEM can be identified by viewing the file in a text editor. This is an unsecure format and not recommended for private key use unless it is protected with a password.

**PKCS#12:** Public Key Cryptography Standard (PKCS) #12. A secure, binary format, encrypted with a password. Typically used to describe one certificate, and its associated private key, but can also include other certificates such as the signing certificate(s). This is the recommended format for private key use.

**PKCS#7:** A Base 64 (i.e. ASCII text) encoding defined by RFC 2315, one or more certificates are enclosed between '-----BEGIN PKCS-----' & '-----END PKCS7-----' statements. It can contain only Certificates & Chain certificates but not the private key. Can be identified by viewing the file in a text editor.

There are many common filename extensions in use:

- .CRT — Can be DER or PEM. Typical extension used by Unix/Android systems' public certificates files in DER format.

- .CER — Can be DER or PEM. Typical extension used by Microsoft/Java systems' public certificates files in PEM format.
- .PEM — Should only be PEM encoded.
- .DER — Should only be DER encoded.
- .p12 — Should only be in PKCS#12 format. Typical extension used by Unix/Android systems' identity certificates/private key pair files. Same format as .pfx hence can be simply renamed.
- .pfx — Should only be in PKCS#12 format. Typical extension used by Microsoft systems' identity certificates/private key pair files. Same format as .p12 hence can be simply renamed.
- .pb7 — Should only be in RFC 2315 format. Typical extension used by Microsoft and Java systems for certificate chains.

# Chapter 73: Configuration for Emergency Calls

This page provides a summary of IP Office emergency call handling. For full details, refer to the *IP Office Emergency Call Configuration* manual.

The configuration of every system must contain at least one short code using the **Dial Emergency** feature. **Dial Emergency** overrides all external call barring that may have been applied to the user whose dialing has been matched to the short code. You must still ensure that no other short code or extension match occurs that would prevent the dialing of an emergency number being matched to the short code.

The short code (or codes) can be added as a system short code or as an ARS record short code. If the **Dial Emergency** short code is added at the solution level, that short code is automatically replicated into the configuration of all servers in the network and must be suitable for dialing by users on all systems. Separate **Dial Emergency** short codes can be added to the configuration of an individual system. Those short codes will only be useable by users currently hosted on the system including users who have hotdesked onto an extension supported by the system.

It is the installers responsibility to ensure that a **Dial Emergency** short code or codes are useable by all users. It is also their responsibility to ensure that either:

- the trunks via which the resulting call may be routed are matched to the physical location to which emergency service should be dispatched
- the outgoing calling line ID number sent with the call matches the physical location from which the user is dialing.
- If the system uses external dialing prefixes, you should also ensure that the dialing of emergency numbers with and without the prefix is allowed.

The blocking or rerouting of emergency calls to a intermediate destination other than the emergency response service may be against local and nation laws.

## Hot Desking Users

In addition to the location requirements above, you must also remember that for users who hot desk, from the networks perspective the user's location is that of the system hosting the extension onto which the user is currently hotdesked. If that is an IP extension then that location is not necessarily the same as the physical location of the server.

## Emergency call setup

Routing of emergency calls is based on a call resolving to a **Dial Emergency** short code. Based on the location value for the extension making the call, routing is performed by the **Emergency**

**ARS** form configured for that location. You must ensure that the short codes in the ARS use lines appropriate for emergency calls from that location.

### Configuring emergency call routing

At its simplest, Create a **Dial Emergency** system short code. Note that the **Line Group ID** value in the **Dial Emergency** short code is overridden if the extension's **Locations** has an **Emergency ARS** defined.

1. Create system short codes for each emergency number used in the system locale. The short codes should use the **Dial Emergency** feature. Add short codes for the same numbers dialed with and without any expected external dialing prefixes.
2. Create an emergency ARS. This should containing shorts codes that take the output of the system short codes created above and dials them to the external trunks that should be used for emergency calls from the system.
3. Create a **Location** for the system and set the **Emergency ARS** to the ARS created above.
4. Set the location as the system's **Location** value on the System | System page.
5. For each **Extn**, set the **Location** defined above.
6. Test the correct operation of emergency dialing.
7. For networks with multiple systems and locations, create additional emergency ARS entries and locations as necessary to ensure that emergency calls from any location are sent using appropriate trunks.

---

## Emergency Call Indication

IP Office R11.1 SP1 added support for a **911 View** or **Emergency View** programmable button.

- A button set to this function indicates to users on the same system when the IP Office has routed an emergency call out one of its external PSTN trunks.
  - The button gives a ring and flashes when there is a connected emergency call in progress.
  - The button remains lit when there are details of previous emergency calls in the IP Office system's emergency call history.
- Pressing the button displays details of currently connected emergency calls (the first 10 such calls).
- After pressing the button, the **History** option displays details of any previously connected emergency calls (the first 30 such calls) and allows deletion of those call details.
- On J189 phones, the details include the location name if the IP Office used a **Location** record as part of the emergency call routing.
- All users on the IP Office share the same emergency call history information. Changes to the emergency call history affect the details shown on all phones on the same system.

# System Alarm Output

You can configure the IP Office system to generate a system alarm for any call that uses a **Dial Emergency** short code. In addition to reporting connected calls, the alarms also report emergency call attempts that fail for reasons such as no available trunks.

Unlike SMDR call records which the IP Office system generates at the end of a call, the IP Office generates emergency call system alarms immediately a call matches a **Dial Emergency** short code. This is important, as the PSAP emergency operator can stay on the line until the first responders arrive.

You can configure the IP Office to send system alarms to SNMP, syslog, or email. On-site notification applications can use the alarm message to offer a variety of features. For example:

- Email/IM/SMS/Pager alerts with escalation and acknowledgments.
- Location maps with additional information. For example; hazardous material warnings.
- Emergency call alert displays for reception/security desks.
- Printing of alerts for physical archiving.

## Alarm Information

The IP Office provides the following information in the alarm:

- The location name.
- The number dialed by the caller.
- If connected, the called number and ELIN presented on the call. Otherwise, the reason for failure.
- The extension's current logged in user, otherwise `NoUser`. For tandem calls, the *Trunk ID*.
- The extension details and system ID plus:
  - For digital and analog extensions, the physical port details.
  - For telecommuter and mobile call control users, the external phone number.
  - For IP phones and softphone clients, the MAC and IP Address details.

# Chapter 74: Ring Tones

Ring tones can be defined in the following terms.

## **Distinctive Ringing - Inside, Outside and Ringback:**

A distinctive ring tone can be given for each of the different call types: an internal call, an external call and a ringback calls (voicemail calls, ringback when free calls, calls returning from park, hold or transfer).

The distinctive ringing patterns used for most non-analog phones are as follows:

- **Internal Call:** Repeated single-ring.
- **External Call:** Repeated double-ring.
- **Ringback Call:** Two short rings followed by a single ring.

### **Note:**

For non-analog extensions, the ringing pattern used for each call type by the system is not configurable.

## **Personalized Ringing:**

This term refers to control of the ringing sound through the individual phones. For non-analog phones, while the distinctive ringing patterns cannot be changed, the ringer sound and tone may be personalized depending on the phone's own options. Refer to the appropriate telephone user guide.

## **Analog Phone Ringing Patterns**

For analog extensions, the ringing pattern used for each call type can be set using the settings on **System Settings > System > Telephony**. The setting for an individual user associated with an analog extension can be configured using the settings on **Call Management > Users > Add/Edit Users > Telephony > Call Settings**.

Note that changing the pattern for users associated with fax and modem device extensions may cause those devices to not recognize and answer calls.

The selectable ringing patterns are:

- **RingNormal** This pattern varies to match the **Locale** set in the **System | System** tab. This is the default for external calls.
- **RingType1:** 1s ring, 2s off, etc. This is the default for internal calls.
- **RingType2:** 0.25s ring, 0.25s off, 0.25s ring, 0.25s off, 0.25s ring, 1.75s off, etc. This is the default for ringback calls.
- **RingType3:** 0.4s ring, 0.8s off, ...

- **RingType4:** 2s ring, 4s off, ...
- **RingType5:** 2s ring, 2s off, ...
- **RingType6:** 0.945s ring, 4.5s off, ...
- **RingType7:** 0.25s ring, 0.24 off, 0.25 ring, 2.25 off, ...
- **RingType8:** 1s ring, 3s off, ...
- **RingType9:** 1s ring, 4s off, ...
- **RingType0:** Same as **RingNormal** for the United Kingdom locale.
- **Default Ring:** Shown on the User | Telephony | Call Setting tab. Indicates follow the settings on the System | Telephony | Tones & Music tab.

### Configuring Ring Tone Override for Groups and Incoming Call Routes

You can configure ring tone override for groups and incoming call routes. **Ring Tone Override** is supported on 1400, 9400, and 9500 series phones.

Note that you can use short codes to configure a ring tone plan by using the “r” character as part of the short code telephone number field. See [Short Code Characters](#) on page 979.

1. In Web Manager, select **System Settings > System > Telephony > Ring Tones**.
2. In the **Ring Tone Plan** table, enter a **Name** for the ring tone. The **Number** field is populated automatically.
3. Under **Ring Tone**, select one of the eight ring tones from the drop down list.
4. Once configured in this table, ring tone names can be selected from the **Ring Tone Override** field at:
  - **Call Management > Group > Add/Edit Group > Group**
  - **System Settings > Incoming Call Route > Add/Edit Incoming Call Route**

# Chapter 75: Music On Hold

Each system can provide music on hold (MOH) from either internally stored files or from externally connected audio inputs. Each system has one system source and then a number of alternate sources (up to 3 alternate sources on IP500 V2 and 31 alternate sources on Server Edition).

You must ensure that any MOH source you use complies with copyright, performing rights and other local and national legal requirements.

## WAV Files

The system can use internal files that it stores in its non permanent memory. The WAV file properties must be in the format listed below. If the file downloaded is in the incorrect format, it will be discarded from memory after the download.

- PCM, 8kHz 16-bit Mono.
- Maximum length: 90 seconds on IP500 V2 systems, 600 seconds on Linux-based systems.

The first WAV file, for the system source, must be called `HoldMusic.wav`. Alternate source WAV file names:

- Up to 27 IA5 characters with no spaces.
- Any file extension.
- On Linux-base systems, the filename is case sensitive.

The files, when specified by the system source or an alternate source setting, are loaded as follows:

- Following a reboot, the system will try using TFTP to download the file or files.
- The initial source for TFTP download is the system's configured **TFTP Server IP Address (System | System | LAN Settings)**. The default for this is a broadcast to the local subnet for any TFTP server.
- Manager can act as a TFTP server while it is running. If Manager is used as the TFTP server, then the wav file or files should be placed in the Manager applications working directory.

### **Note:**

The following Manager settings are disabled by default:

- **Security Settings | Unsecured Interfaces | Applications Controls | TFTP Directory Read**
- **File | Preferences | Preferences | Enable BootP and TFTP Servers**
- On Linux based systems, if no successful TFTP download occurs, the system automatically looks for the files in the `opt/ipoffice/tones/mohwavdir` folder (`disk/tones/mohwavdir` when access using file manager).

- The name of the system music .wav file should be **HoldMusic.wav**. The name of alternate source .wav files should be as specified in the **Alternate Sources** table (**System | Telephony | Tones and Music**) minus the **WAV:** prefix.

### WAV File Download and Storage:

- If no successful TFTP download occurs:
  - On IP500 V2 systems, the system automatically looks for the file in the `system/primary` folder on the System SD card and downloads it from if found.
  - On Linux based systems, the system automatically looks for the file in the folder `opt/ipoffice/system/primary` folder (`disk/system/primary` when accessed using file manager) and downloads it from there if found.
- If a music on hold file is downloaded, the system automatically write a copy of that file to its memory card, overwriting any existing file of the same name already stored on the card.
- For files downloaded from a System SD card, the system will download the file again if the SD card is shutdown and restarted or if files are uploaded to the card using the Embedded File Manager.
- The system will download the file again if new files are copied to the disk or uploaded using File Manager.

### Tone

If no internal music on hold file is available and **External** is not selected as the **System Source**, then the system provides a default tone for music on hold. The tone used is double beep tone (425Hz repeated (0.2/0.2/0.2/3.4) seconds on/off cadence). **Tone** can be selected as the **System Source**, overriding both the use of the external source port and the downloading of **HoldMusic.wav**.

### Controlling the Music on Hold Source Used for Calls

Unless specified, the System Source is used for any calls put on hold by system users. For any call, the last source specified for the call is the one used. The following options allow the source to be changed.

- **Hunt Group** Each hunt group can specify a **Hold Music Source (Group | Group)**. That source is then used for calls presented to the hunt group.

In a multi system network, a hunt group member will hear the music on hold (MOH) from their local system. For example, a call comes in to site A and rings a hunt group with members from system A and system B. If a hunt group member from system B answers a call and puts the call on hold, the caller hears the MOH from system B.

- **Incoming Call Route** Each incoming call route can specify a **Hold Music Source (Incoming Call Route | Standard)**. That source is then used for incoming calls routed by that incoming call route.
- **Short Code** The **h** character can be used in the **Telephone Number** field of short codes to specify the hold music to associate with calls routed by that short code. The format **h( X )** is used where **X** is the source number. This method can be used to specify a hold music source for outgoing calls.

### Checking Music on Hold

The system short code feature Hold Music can be used to listen to the hold music sources. Dial **\*34N#**, replacing **N** with the source number 1 (System Source) or 2 to 32 (Alternate Sources).

---

## System Source

The first source is called the **System Source**. This source is numbered source 1. The possible options for this source are:

| Setting              | Description                                                                                                                                                                                                                                                        |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>WAV</b>           | Use the <code>HoldMusic.wav</code> file. The IP Office loads the file using TFTP, or you can directly add the file using the embedded file manager.                                                                                                                |
| <b>WAV (restart)</b> | Identical to WAV except that for each new listener, the file plays from the beginning. <ul style="list-style-type: none"> <li>• Not supported on IP500 V2 systems.</li> <li>• Cannot be used as a centralized source.</li> </ul>                                   |
| <b>External</b>      | Applicable to IP500 V2 systems. Use the audio source connected to the <b>Audio</b> port on the control unit.                                                                                                                                                       |
| <b>Tone</b>          | Use a double beep tone: 425Hz, 02./0.2/0.2/3.4 seconds on/off. <ul style="list-style-type: none"> <li>• This tone is also used if the system source is set to <b>WAV File</b> but the <code>HoldMusic.wav</code> file has not been successfully loaded.</li> </ul> |

## Alternate Source

You can specify alternate MOH sources on the **System Settings > System > Telephony > Tones and Music** page.

You can assigned the alternate sources as the **Hold Music Source** for an **Incoming Call Route** or a **Group**.

- That assigned MOH source overrides any current MOH source associated with the call.
- The assigned MOH source remains associated with the call as it moves around the IP Office system. This is done using the number of the MOH source (with 1 being the number of the default system source).
- If the call moves to another IP Office system in a multi-site network, the source with the same number of the other system is used if also configured on that system.

## IP500 V2 Alternate Sources

For IP500 V2 systems, you can specify up to 3 alternate sources.

| Source          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WAV:<filename>  | <p>Play a specified file from its start or, if already in use, for where it is already playing.</p> <ul style="list-style-type: none"> <li>The &lt;filename&gt; parameter specifies the file to play: <ul style="list-style-type: none"> <li>Up to 27 IA5 characters with no spaces.</li> <li>Any file extension.</li> <li>On Linux-base systems, the filename is case sensitive.</li> </ul> </li> <li>The file location is /system/primary.</li> <li>The source always starts playback from where it last finished playback.</li> <li>At any moment, all users listening to this source hear the same thing.</li> </ul> |
| XTN:<extension> | <p>Play the source connected to an analog extension port on the IP500 V2 system.</p> <ul style="list-style-type: none"> <li>You must set the analog extensions <b>Equipment Classification</b> as <b>MOH Source</b>.</li> <li>The &lt;extension&gt; parameter specifies the extension's <b>Base Extension</b> number. For example: XTN:224</li> </ul>                                                                                                                                                                                                                                                                    |

## Linux-based IP Office system

For a Linux-based IP Office system, you can specify up to 31 alternate sources.

| Source       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LINE:<X>,<Y> | <p>Use an alternate source from another IP Office system in the network where:</p> <ul style="list-style-type: none"> <li>&lt;X&gt; = The line number of the connection to the other Linux-based IP Office system (not the outgoing group ID).</li> <li>&lt;Y&gt; = The MOH source number on the other Linux-based server. <ul style="list-style-type: none"> <li>WAVRST and WAVDIRRST alternate sources are not supported.</li> </ul> </li> <li>When the IP Office requires the source, it creates a VoIP call to the source IP Office system. This uses call capacity from the trunk and can be subject to CAC limits.</li> <li>The IP Office drops calls to the source after 30 seconds of no use. You can change the time using the NoUser source number <code>HOLD_MUSIC_TIMEOUT=x</code> where x is the number of seconds. The range is 1 to 600 seconds.</li> </ul> |

# Chapter 76: System Date and Time

IP Office servers can obtain their date and time either automatically from a time server or have it set manually.

## How Does the System Use the Date and Time

For files stored on memory cards the system uses the UTC time. For other activities such as call logs, SMDR records, time display on phones; the local system time (UTC + any offsets) is used.

[Manually Changing the System Date and Time](#) on page 790

---

## System Date and Time Options

IP Office servers can obtain their date and time either automatically from a time server or have it set manually.

### Important:

- It is strongly recommended to always use the address of an internet time server to automatically obtain the date and time. An accurate time and date is essential to all features that use security certificates. Manually setting the time and date should be avoided.

### Linux-based IP Office Systems

The date and time source settings are set through the server's **Platform View** menus using the **Settings | System | Data and Time** settings.

The supported options are:

| Option        | Description                                                                                                                                                                                                                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SNTP</b>   | Use the date and time provided by an SNTP time server. The UTC time provided by the time server is then adjusted using the server's timezone setting.<br><br>If you have a network of servers, it is typical to set the primary server to use an external SNTP source and all other servers are set to use SNTP from the primary server's own address. |
| <b>Manual</b> | Enter the date and time through the platform view menu.                                                                                                                                                                                                                                                                                                |

## IP500 V2 Systems

The time and date settings for these systems are configured through their **Time Setting Config Source** settings (**System Settings > System > System**).

The supported options are:

| Option                        | Description                                                                                                                                                                                                                  |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SNTP</b>                   | Get the date and time from an SNTP time server in the same way as Linux based systems above do.                                                                                                                              |
| <b>Voicemail Pro/ Manager</b> | Get the date and time from the Windows PC running either the Voicemail Pro or IP Office Manager applications. This option requires the application to be running when the IP Office is started and for regular time updates. |
| <b>None</b>                   | Get the date and time from values entered via a system phone. See <a href="#">Manually Changing the System Date and Time</a> on page 790.                                                                                    |

## Applying Daylight Saving

You can have the IP Office apply daylight saving time (DST) changes at certain times of the year. How you do this depends on the type of IP Office server and the type of time source you have configured it to use:

| Server Type               | Description                                                                                                                                                                                                                            |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Linux-based Server</b> | Daylight saving adjustments are applied to the SNTP time by defining a <b>Location</b> for the system. The location settings include the time zone the system it is in and whether to apply daylight saving changes for that location. |

*Table continues...*

| Server Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP500 V2 Server | <p>The method of applying daylight saving depends on the time source used by the server:</p> <ul style="list-style-type: none"> <li>• <b>SNTP/None:</b><br/>The <b>System Settings &gt; System &gt; System</b> menu includes settings for specifying when to apply daylight saving.<br/>- The system can still also use a <b>Location</b> to override the timezone and daylight saving settings of the system.</li> <li>• <b>Voicemail Pro/Manager: (Obsolete)</b><br/>If the system is obtaining its time from a Windows PC running Voicemail Pro or IP Office Manager. The PC needs to be configured to apply DST to the time it provides.</li> </ul> |

## Using Locations to Apply DST

In a network of IP Office systems, it may be necessary for some systems or extensions, to have different time and date settings to match where they are physically located. This can be done by adding **Location** entries to the configuration.

Each location can include a time offset from the UTC time and a set of daylight saving settings for the location. You can then:

- Associate IP Office systems with their locations.
- Associated extension and lines with different locations if they require different settings from their host IP Office system.

## Editing the DST Calendar

Based on the system's selected timezone, the IP Office automatically adds a set of dates for when daylight saving is applied and removed. The dates are editable.

- The current dates for applying and removing the DST settings are shown below the **Automatic DST** option on the **System > System** and **Location > Location** menus.
- Each entry specifies when the IP Office should apply an additional time offset, and when the IP Office should remove the additional time offset.
- You can use the adjacent **Edit** and **Delete** buttons to adjust the calendar entries.
- Note that the list can only include 10 entries (20 for IP Office R11.1.3.2 and higher).
  - To add a new entry, you may need to delete an existing entry. After doing that, **Add New Entry** appears at the bottom of the list.

# Checking Automatic Time and Date Operation

Operation of an IP Office server's time and date operation can be checked using the System Status Application. Within System Status Application, the **Resources > Time** menu displays the current date and time, the time source, results of the last time request and other settings.

## Investigating Potential Time and Date Issues

When using an internet based time server, check the following:

1. Check the configured time server address.
2. Check routing from the server to the internet via the customer's network.
  - For Linux-based servers, check the default gateway address for the customer's network is shown in the server's Platform View menus.
  - For all servers, check that the configuration includes a default IP Route to the customer network's default gateway address.

## Manually Changing the System Date and Time

It is strongly recommended that IP Office systems obtain their time and date automatically from an internet based time server. However, if configured otherwise, the following methods can be used to change the current system time and date.

### Linux-based IP Office Systems

For a Linux-based IP Office system, the system date and time can be set through the server's **Platform View** menus using the **Settings | System | Data and Time** settings.

### IP500 V2 Systems

For IP500 V2 systems set to no time server source, date and time changes can be done through the phone menus of a user who has been given **System Phone Rights** (see [System Phone Features](#) on page 850). The user's **Login Code** is used to restrict access to the time and date settings menu on the phone.

How the user accesses the date/time settings depends on the type of phone:

| Phone type                                           | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1400, 1600, 9400, 9500, 9600, and J100 Series</b> | <p>For a user with <b>System Phone Rights</b>, on these phones the user can set the system time and date by selecting <b>Features   Phone User   System Administration</b>.</p> <ul style="list-style-type: none"> <li>• This does not include the 1403, 1603 and J129 phones.</li> <li>• If the system has been configured with a time server, this option can still be used to display time and date information but cannot be used to change it.</li> </ul> |

# Chapter 77: Configuring Time Profiles

Time profiles are configured on **System Settings > Time Profiles**

Time Profiles are used by different services to change their operation when required. In most areas where time profiles can be used, not setting a time profile is taken as meaning 24-hour operation.

Time profiles consist of recurring weekly patterns of days and times when the time profile is in effect.

Time profiles can include time periods on specified calendar days when the time profile is in effect. Calendar records can be entered for the current and following calendar year.

For a Server Edition network, these settings can be configured at the network level and are then automatically replicated in the configuration of all systems in the network. They can only be seen and edited at the individual system configuration level if record consolidation is switched off.

Time profiles are used by the following record types.

## **Hunt Group:**

A time profile can be used to determine when a hunt group is put into night service mode. Calls then go to an alternate Night Service Fallback group if set, otherwise to voicemail if available or busy tone if not.

Setting and clearing hunt group night service can be done using either manual controls or using a system time profile. The use of both methods to control the night service status of a particular hunt group is not supported.

For automatic voice recording, a time profile can be used to set when voice recording is used.

## **User:**

- Users being used for Dial In data services such as RAS can have an associated time profile that defines when they can be used for that service.
- Users can be associated with a working hours and an out of hours user rights. A time profile can then be used to determine which user rights is used at any moment.
- For automatic voice recording, a time profile can be used to set when that voice recording is used.
- For mobile twinning, a time profile can be used to define when twinning should be used.

## **Incoming Call Route:**

Incoming call routes can also use time profiles to specify when calls should be recorded. Multiple time profiles can be associate with an incoming call route, each profile specifying a destination and fall back destination.

## **ARS:**

ARS forms use time profile to determine when the ARS form should be used or calls rerouted to an out of hours route.

### Account Code:

Account Codes can use automatic voice recording triggered by calls with particular account codes. A time profile can be used to set when this function is used.

### Auto Attendant :

Embedded voicemail auto attendants can use time profiles to control the different greetings played to callers.

### Service:

- A Service can use time profiles in the following ways:
- A time profile can be used to set when a data service is available. Outside its time profile, the service is either not available or uses an alternate fallback service if set.
- For services using auto connect, a time profile can be used to set when that function is used. See Service | Autoconnect.

[Overriding a Time Profile](#) on page 792

---

## Overriding a Time Profile

You can use the **System Settings > Time Profiles > Add/Edit Time Profile > Manual Override** setting to manually override a time profile. The override settings allow you to mix timed and manual settings.

The override options are as follows:

- **Set Time Profile Active Until Next Timed Inactive**

Use for time profiles with multiple intervals. Make the time profile active until the next inactive interval.

- **Set Time Profile Inactive Until Next Timed Active**

Use for time profiles with multiple intervals. Make the time profile inactive until the next active interval.

- **Set Time Profile Latch Active**

Set the time profile to active. Timed inactive periods are overridden and remain active.

- **Set Time Profile Latch Inactive**

Set the time profile to inactive. Timed active periods are overridden and remain active.

The illustration below provides an example of each override setting.

A time profile can be overridden using the following methods.

- Using the **Override** settings on the Time Profile configuration page.
- Configure short codes for the time profile. See the description for the “Set Time Profile” short code.
- Configure the Time Profile button action for the time profile. See the description for the “Time Profile” button action.

[Procedures for Applying Licensing](#) on page 801

[Converting from Nodal to Centralized Licensing](#) on page 807

[Migrating Licenses to PLDS](#) on page 808

---

## PLDS licensing

IP Office uses the Avaya Product Licensing and Delivery System (PLDS) to manage licenses. PLDS is an online, web-based tool for managing license entitlements and electronic delivery of software and related license files. PLDS provides customers, Avaya Partners, distributors, and Avaya Associates with easy-to-use tools for managing license entitlements and electronic delivery of software and related license files. Using PLDS, you can perform operations such as license activations, license upgrades, license moves, and software downloads. You can access PLDS from <http://plds.avaya.com/>.

### PLDS license files

Licenses are delivered from PLDS with license files. A PLDS license file is generated for installing on a specific machine. There are two deployment options:

- PLDS Nodal license files are generated for and installed on particular IP Office nodes.
- PLDS WebLM license files are generated for and installed on a WebLM server that can license multiple IP Office nodes.

WebLM centralized licensing is supported in IP Office Server Edition and in IP Office Branch deployments, but not in non-Branch deployments of IP Office Standard mode.

### PLDS host ID

PLDS Nodal license files are machine specific and you must specify the host ID in the **PLDS host ID** field on **System Settings > Licenses > Systems > Manage Licenses**.

| System Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IP500 V2 Systems</b>       | You can find the PLDS host ID in the <b>Licensing</b> tab of IP Office Manager and Web Manager. The PLDS host ID is made of the two digits “11”, followed by the 10 digit feature key serial number printed on the IP Office SD card. If the SD card is changed, the PLDS host ID will also change.                                                                                                                                                                                                                                |
| <b>IP Office Linux Server</b> | The PLDS host ID can be found on the server labeling, the server packaging label, and the system ignition Login screen. The PLDS host ID is derived from the system ID. If the system ID changes, the PLDS host ID will also change.                                                                                                                                                                                                                                                                                               |
| <b>WebLM</b>                  | <p>The WebLM host ID is the Mac address of the WebLM server. The WebLM host ID must be used when generating a PLDS license file for the WebLM server in order to implement a centralized licensing scheme for multiple IP Office systems.</p> <p>The WebLM host ID can be found on the server labeling, the server packaging label, the system ignition Login screen, and through the WebLM management interface.</p> <p>In a virtual environment, the WebLM host ID is a virtual Mac address that starts with the letter “V”.</p> |

## Web License Manager (WebLM)

The Web License Manager (WebLM) is a web-based application for managing licenses. If you use the WebLM server running on the IP Office server, then you can use IP Office Web Manager to log in to the WebLM server by selecting **Applications > Web License Manager**. WebLM credentials are managed separately from IP Office system passwords and are not part of single sign on (SSO).

 **Note:**

- WebLM license management is supported for Server Edition deployments and for Enterprise Branch deployments using the System Manager WebLM server. It is not supported for Standard Mode systems.
- When upgrading from a previous release, all systems must be running the same software level. IP Office Server Edition does not support mixed versioning.

For more information on WebLM, see *Administering standalone Avaya WebLM*.

To establish communication between IP Office and the WebLM server, you must configure the remote server profile on **System Settings > Licenses > Systems > Remote Server**.

 **Note:**

When upgrading from release 9.1, the WebLM server is not started automatically. Perform the following steps to start the WebLM server.

1. Log in to Web Manager.
2. Select **Server Menu > Platform View > System**.

3. Under **Services**, select the WebLM server and click **Start**.

## Server Edition Centralized Licensing

Before release 10, Server Edition deployments used nodal licensing. This type of licensing can still be used in release 10 and higher. However, it is expected that most deployments will prefer to centralize license management using the Avaya Web License Management (WebLM) server. The WebLM server is automatically installed on the Server Edition Primary server. For newly installed systems, centralized licensing is the default configuration.

All systems in the Server Edition solution must use the same **License Source**.

### Nodal licensing

With nodal licensing, license files must be installed on each node in the system. For some licensed features, the required license can be installed on the Server Edition Primary server and used by all nodes in the system. However, for other licensed features, the required license must be installed on the node where the feature is used.

### Centralized licensing

As of release 10, you can use the WebLM server running on the Server Edition Primary server to fully centralize license management. With centralized license management, all licenses are contained in a single PLDS file uploaded to WebLM. All nodes in the solution obtain their licenses from WebLM.

The IP Office Secondary server and Expansion systems can be configured to request licenses directly from the WebLM server, or to use a proxy option. When configured to use the proxy option, the license requests are sent through the IP Office Primary server, which proxies the requests to the WebLM server. The Primary server does not allocate licenses, but only acts as a proxy.

Systems using nodal licensing can be converted to use centralized licensing. Since PLDS license files are generated using the host ID of the server where they reside, you must regenerate the license file using the host ID of the WebLM server that will host the license file.

**PLDS File Location**

How licenses are allocated depends on the location of the PLDS file. For standalone systems, SCN deployments, and Server Edition nodal licensing, each node in the system must have a PLDS file installed.

**Figure 1: PLDS file location for Server Edition Nodal Licensing**

For Server Edition centralized licensing, the PLDS file is located on the WebLM server. The WebLM server can be located on the Primary Server or on a remote server.

**Figure 2: PLDS file location for Server Edition Centralized Licensing**

[Centralized license distribution](#) on page 799

## Nodal license distribution

When the **License Source** is **Local**, the **Reserved Licenses** read-only fields indicate licenses that are required for the currently configured features.

Nodal licensing for a Server Edition solution is based on a combination of licensing done through the Server Edition Primary server plus some server-specific licenses. All the user specific and system specific licenses can be managed from the Server Edition Primary server that also acts as a licensing server. Licenses are entered into the configuration of the Server Edition Primary server and are based on the system ID of that server.

Where a license is used to enable features, such as SIP Trunk channels, on other systems, the Server Edition Primary server only allocates those licenses to other systems after it has met its own license needs.

When another system loses connection to the Server Edition Primary server, any license requirements based on those licenses entered in the Server Edition Primary server's configuration are supported for a grace period of 30 days.

Other server specific licenses are entered into the configuration of the server requiring the feature and are based on the System ID of that system.

| License                                                             | Primary server | Server-specific |
|---------------------------------------------------------------------|----------------|-----------------|
| Server Edition                                                      | ✓              | ✗               |
| Avaya IP endpoints                                                  | ✓              | ✗               |
| Third-party IP endpoints                                            | ✓              | ✗               |
| SIP trunk channels                                                  | ✓              | ✗               |
| IP500 universal PRI channels                                        | ✗              | ✓               |
| Additional voicemail ports <sup>[3]</sup>                           | ✓              | ✗               |
| UMS Web Services <sup>[1]</sup>                                     | ✗              | ✓               |
| Office Worker                                                       | ✓              | ✗               |
| Power User                                                          | ✓              | ✗               |
| Office Worker to Power User upgrade                                 | ✓              | ✗               |
| Receptionist                                                        | ✗              | ✓               |
| CTI Link Pro                                                        | ✗              | ✓               |
| Messaging TTS Pro <sup>[3]</sup>                                    | ✓              | ✗               |
| Voicemail Pro Recording Administrator <sup>[2]</sup> <sup>[3]</sup> | ✓              | ✗               |
| WAV User                                                            | ✗              | ✓               |
| IPSec tunneling                                                     | ✗              | ✓               |

1. For UMS Web Services, which support Hunt Groups, the license can be deployed nodally on the server that hosts the Voicemail Pro application.
2. The Voicemail Pro Recording Administrator license refers to Contact Store. Only one license is required for a Server Edition network.
3. For deployments with dual Voicemail Pro servers, Messaging TTS Pro, Voicemail Pro Recording Administrator, and Additional voicemail ports licenses must be on the Secondary Server.

[Distributing Server Edition Licenses](#) on page 796

## Centralized license distribution

When the license source is WebLM, the **Reserved Licenses** read-only fields indicate licenses that are required for the currently configured features. Editable fields can be used to:

- Request additional licenses from the WebLM server.
- Remove licenses from the IP Office node to apply them elsewhere.

### Important:

When reallocating licenses, always reduce the number on the IP Office node where they are currently applied before applying them on another node. If you exceed the number of licenses available, you will receive an error message.

## Distribution after conversion from Nodal to Centralized licensing

- If the IP Office node needs any of the following licenses, then you must manually configure the respective **Reserved Licenses** editable fields. This will allow the IP Office node to request the licenses from the WebLM server.

- **VMPPro Recordings Administrators**
- **VMPPro TTS Professional**
- **CTI Link Pro**

**Extension Reserved license setting:** When the license source is **Local**, the setting **Extension > VoIP > Reserve License** is set to **None**. Switching the license source to WebLM changes the setting to **Reserve Avaya IP endpoint license**. If required, you must manually change this setting to **Reserve 3rd party endpoint license** or **Both**.

## License allocation in WebLM

You can use WebLM to view the licenses used by each node in IP Office Server Edition. In the WebLM navigation pane on the left, click **Licensed Products**. The Acquired licenses table displays information about the licenses acquired for each client ID. In IP Office, the WebLM client ID for each node is displayed on the license Remote Server page.

## Obtaining the Host ID of the WebLM Server

The WebLM Host ID is required to generate a PLDS license file for centralized licensing. The license file is uploaded to the WebLM server.

### Procedure

1. In Web Manager, select **Applications > Web License Manager**.
2. Log in to WebLM.
3. In the navigation pane on the left, click **Server Properties**.

The Server Properties page displays the Host ID. The host ID is the MAC address of the Server Edition Primary server.

Record the host ID.

[Procedures for Applying Licensing](#) on page 801

## Installing a License File on the WebLM Server

Use Web Manager to log in to the WebLM license server and install a license file.

### Before you begin

Obtain the license file from the Avaya Product Licensing and Delivery System (PLDS) Web site at <https://plds.avaya.com>.

You must know the user ID and password for the WebLM server. WebLM credentials are managed separately from IP Office system passwords and are not part of single sign on.

### Procedure

1. Log in to Web Manager.
2. Select **Applications > Web License Manager**.
3. Log in to the WebLM server.
4. In the left navigation pane, click **Install license**.
5. On the Install license page, click **Browse** to select the license file.

6. Click **Install** to install the license file.

WebLM displays a message upon successful installation of the license file.

If the installation is not successful, for troubleshooting information see *Administering Avaya WebLM*, available on the Avaya support site.

## Configuring the Server Edition License Source

For Server Edition deployments, the license source can be centralized or nodal.

- With centralized licensing, the PLDS license file resides on the WebLM server. The WebLM server is the license source and all nodes in the solution receive licenses from the WebLM server. The WebLM server can run on a remote machine or on the Primary Server.
- With nodal licensing, a PLDS license file is uploaded to each node.

All systems in the Server Edition solution must use the same license source. The license source is defined by the configuration setting **System Settings > Licenses > Server Menu > Manage Licenses > License Source**. Use this procedure to set all nodes to use the same license source.

#### Procedure

1. Log in to Web Manager.
2. Click **Solution > Configure > Set All Nodes License Source**
3. In the Select License Source window, select either
  - **Local/Primary Server** for nodal licensing.
  - **WebLM** for centralized licensing.

All nodes in the solution are set to the same license source.

#### Related links

[Procedures for Applying Licensing](#) on page 801

## Uploading a PLDS License File to IP Office

Use this procedure to upload a PLDS license file for nodal license management. Nodal license management is used for standalone IP500 V2 systems and is an option for Server Edition systems.

#### Before you begin

The PLDS license file must be on the local machine where IP Office Web Manager is running

#### Procedure

1. In IP Office Web Manager, select **System Settings > Licenses > Server Menu > Manage Licenses**.

2. Click **PLDS Licenses** and select **Send To IP Office** and then click **OK**.
3. In the Select PLDS License File window, click **Browse** and navigate to the license file.
4. Select the file and click **OK**.

#### Related links

[Procedures for Applying Licensing](#) on page 801

## Configuring Server Edition Nodal Licensing

With nodal licensing, licenses are managed using license files installed on each node in the system. For information on license distribution, see [Distributing Nodal Licenses](#) on page 798.

### Procedure

1. In IP Office Web Manager, select **System Settings > Licenses**. Click on the **Server Menu** to the right of the Primary Server and then on the License Configuration page, select **Remote Server**.
2. In the **Licence Source** field, select **Primary**.

#### **Note:**

All systems in the Server Edition solution must use the same **License Source**. In Manager, on the Solution page, you can select **Set All Nodes License Source** to configure the setting for all nodes in the solution.

3. Enter the Server Edition Primary server IP address in the **License Server IP Address** field.
4. Under **Reserved Licenses**, the right hand column indicates which licenses have been reserved for this system. Use the left hand column to request additional licenses for this system.
5. Click **OK**.

Licenses are displayed in the table.

6. Repeat steps 1 to 5 for the Server Edition Secondary server and all Server Edition Expansion Systems.

#### Related links

[Procedures for Applying Licensing](#) on page 801

## Configuring Server Edition Centralized Licensing

With centralized licensing, licenses are managed from a central WebLM server.

### Before you begin

You must have a PLDS license file activated with the host ID of the WebLM server

## Procedure

1. In IP Office Web Manager, select **System Settings > Licenses**. Click on the **Server Menu** to the right of the Primary Server and then on the License Configuration page, select **Remote Server**.
2. Ensure **Licence Source** is set to **WebLM**.

 **Note:**

All systems in the Server Edition solution must use the same **License Source**. In Manager, on the Solution page, you can select **Set All Nodes License Source** to configure the setting for all nodes in the solution.

3. The WebLM server can be located on the Server Edition Primary server or on a separate server. Enter the domain name or IP address of the WebLM server in the **Domain Name (URL)** field.

Note that the domain name URL must use `https://`.

4. If required, change the path to the WebLM server in the **Path** field.
5. Under **Reserved Licenses**, the right hand column indicates which licenses will be automatically requested from the WebLM server. Use the left hand column to request additional license types for this system.
6. Navigate to the **Remote Server** page for the Server Edition Secondary server.
7. Ensure the **Licence Source** is set to **WebLM**.
8. You can choose to enable the **Enable proxy via Primary IP Office line** check box.

| Choice Option   | Choice Description                                                                                                                                       |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enabled</b>  | The WebLM request is sent to the WebLM server via the IP Office line configured to the Server Edition Primary server. The line must be up and in service |
| <b>Disabled</b> | The WebLM request is sent directly to the WebLM server.                                                                                                  |

9. If **Enable proxy via Primary IP Office line** is enabled, enter the Server Edition Primary server IP address in the **Primary IP Address** field.
10. If **Enable proxy via Primary IP Office line** is disabled:
  - a. Enter the domain name or IP address of the WebLM server in the **Domain Name (URL)** field.
  - b. If required, change the path to the WebLM server in the **Path** field.
  - c. If required change the default **Port Number**.

For information on port usage see the IP Office Port Matrix document on the Avaya support site at <https://support.avaya.com/helpcenter/getGenericDetails?detailId=C201082074362003>.

11. Click **OK**.

Licenses are displayed in the **License | License** table.

12. Repeat steps 8 to 12 for all Server Edition Expansion Systems.

 **Note:**

In Manager, on the Solution page, you can select **Set All Nodes License Source**.

**Related links**

[Procedures for Applying Licensing](#) on page 801

## Configuring the License Server in an Enterprise Branch Deployment

Use this procedure to configure WebLM centralized licensing where a shared PLDS license file is installed on the WebLM server. This is the recommended method for installing license files on IP Office systems that are centrally managed by System Manager.

For a complete description of deploying Enterprise Branch, see *Deploying Avaya IP Office™ Platform as an Enterprise Branch with Avaya Aura® Session Manager*.

### Procedure

1. Log in to Web Manager and select **License | Remote ServerSystem Settings > Licenses > Systems > Remote Server**.
2. Select the **Enable Remote Server** check box.  
The **Reserved Licenses** information is displayed.
3. In the **Domain Name (URL)**, field, enter the domain name or IP address of the WebLM server or the domain name of System Manager if the system is under System Manager control.
4. **(Optional)** If a secondary System Manager is configured, enter the domain name in the **Secondary Domain Name (URL)** field.
5. If required, change the path to the WebLM server in the **Path** field.
6. If required change the default **Port Number**.

For information on port usage see the IP Office Port Matrix document on the Avaya support site at <https://support.avaya.com/helpcenter/getGenericDetails?detailId=C201082074362003>.

7. Under **Reserved Licenses**, the right hand column indicates which licenses will be automatically requested from the WebLM server. Use the left hand column to request additional licenses for this system.

# Converting from Nodal to Centralized Licensing

If you are upgrading from an earlier release, perform the procedure [Migrating Licenses to PLDS](#) on page 808.

 **Note:**

When upgrading from a previous release, all system must be running the same software level. The IP Office Server Edition Solution does not support mixed versioning.

## Procedure

1. You must generate a license file using the WebLM host ID. Perform the following steps to find the WebLM host ID.
  - a. In Web Manager, select **Applications > Web License Manager**.
  - b. Log in to WebLM.
  - c. In the navigation pane on the left, click **Server Properties**.  
 The Server Properties page displays the Host ID. The host ID is the MAC address of the Server Edition Primary server.  
 Record the host ID.
2. Generate a PLDS license file using the WebLM host ID.
3. Upload the license file.
  - a. In Web Manager, select **ApplicationsWeb License Manager**.
  - b. In the navigation pane on the left, click **Install license**.
  - c. Click **Browse** to select the license file.
  - d. Click **Install** to install the license file.
4. All nodes in the solution must have the same license source. To configure centralized licensing, all nodes must have the **License Source** set to **WebLM**. You can use Manager to set all nodes to the same license source. On the Manager Solution page, on the right hand side, select **Set All Nodes License Source** and then select **WebLM**.
5. If you are performing this procedure after an upgrade, you must ensure that the **Domain Name (URL)** field is populated on the Server Edition Primary server.
  - a. In Web Manager select **System Settings > Licenses > Server Menu > Remote Server** for the Server Edition Primary server.
  - b. Ensure that the **Domain Name (URL)** field contains the domain name or IP address of the Server Edition Primary server.
6. Reallocate the licenses as required. See [Distributing Centralized Licenses](#) on page 799.

Note that the previously install local licenses are listed as obsolete. You can use this list to determine which licenses to request from the WebLM server. Once licenses have been reallocated, you can delete the obsolete licenses.

# Migrating Licenses to PLDS

IP Office release 10 and higher supports only the Product Licensing and Delivery System (PLDS) to manage license files. If you are upgrading from a previous release, you must migrate all of your pre-R10 licenses (ADI, PLDS, mix of ADI/PLDS, virtual) to R10 PLDS licenses. The license migration tool extracts all the licensing information from an IP Office system and saves it to a file. This file can then be used prepare a software upgrade quote in the Avaya One Source Configurator in order to obtain the required new PLDS R10 licenses.

For Server Edition deployments, the License Migration tool collects licensing information from every node in the solution.

### Note:

- You must use the release 10 or higher Manager client to generate the license inventory file.  
You can install Manager before upgrading to release 10. See the procedure “Installing Manager” in *Administering Avaya IP Office™ Platform with Manager*.
- License migration is supported on all IP Office modes, release 6.0 and higher.
- The license migration tool can only be used with an online configuration. The **Tools > License Migration** option is disabled for offline configurations.
- The license migration tool is not available on UCM and Application servers. When you run the license migration tool on a Server Edition server, the tool collects licensing information from every node in the solution.
- The generated file can be read but must not be edited. License migration will fail if the file has been edited.

## Before you begin

Ensure all licenses are loaded on the system before performing the license migration. For Server Edition deployments, ensure all nodes are online in order to capture the current view of systems in the solution.

The IP Office configuration must be opened online. The License Migration tool is not available in offline mode.

## Procedure

1. Log in to Manager and select **Tools > License Migration**.  
The Save As window opens.
2. Select a location to save the file and enter a file name.
3. Click **Save**.

The file is saved with a `.zip` extension.

**Next steps**

Use the file to prepare a software upgrade quote in the Avaya One Source Configurator in order to obtain the required new PLDS R10 licenses. Once you have the PLDS license files, apply them to the system.

[Applying Licenses](#) on page 794

# Chapter 79: Working with Templates

IP Office supports a number of template options. The settings for the following types of configuration items can be saved as template files. New records of those types can then be created from the template file.

- **User** (.usr)
- **Extension** (H.323, SIP, IP DECT) (.ext)
- **Group** (.grp)
- **Service** (.ser)
- **Tunnel** (.tnlt)
- **Firewall Profile** (.fpr)
- **Time Profile** (.tpr)
- **IP Route** (.ipr)
- **ARS** (.ars)
- **Line** (H.323, SIP, IP DECT) (.lne)
  - The SIP trunk services from selected SIP providers are tested as part of the Avaya DevConnect program. The results of such testing are published as Avaya Application Notes available from the Avaya DevConnect web site (<https://devconnect.avaya.com>).

[Creating an Analog Trunk Template in Manager](#) on page 811

[Creating a New Analog Trunk from a Template in Manager](#) on page 812

---

## Saving Template files

The location used to store template files depends on the type of IP Office system.

- **IP500 V2 - IP Office Manager** export templates to a \manager\_files\template sub-folder of the directory where it is installed.
- **Linux-based systems:** - Templates are stored on the Primary Server. When the system configuration is opened by IP Office Manager, those templates are downloaded from server

to the `\manager_files\template` folder. When the configuration is saved, the templates are uploaded back to server.

 **Caution:**

- If you are using IP Office Manager to manage both IP500 V2 and Linux-based IP Office systems, you need to ensure that you store the IP500 V2 templates in a directory other than the default directory before opening any Linux-based system configuration. When doing so, existing template in the `\manager_files\template` folder may be overwritten.

## Creating a Template in Manager

You can create a template from an existing record.

The options **New From Template** and **Export as Template** are available by:

- right clicking on the record type in the Navigation pane
- right clicking on a record in the Group pane
- using the Details Toolbar in the Details pane

This procedure uses the Group Pane.

**Procedure**

1. In the Navigation pane, select a record type.
2. In the Group pane, right click on the record on which you want to base your template and select **Export as Template**.
3. The **Save As** window opens at the default template folder. Enter a name for the template.  
A default extension is applied. For example, user templates are saved with the file extension `.usr` and extension templates are saved with file extension `.ext`.
4. Click **Save**.

You can now create new records using the template.

## Creating an Analog Trunk Template in Manager

You can create an analog trunk template from an existing trunk..

### Procedure

1. In the Navigation pane, select **Line**.
2. In the Group pane, right click on the record on which you want to base your template and select **Generate Analog Trunk Template**.
3. In the Analog Trunk Template window, you can adjust the settings if required. Click **Export**.
4. In the Template Type Selection window, select the **Service Provider** and then click **Create Template**.
5. In the Browse for Folder window, select Program Files\Avaya\IP Office\Manager\manager\_files\template.
6. Click **OK**.

## Creating a New Analog Trunk from a Template in Manager

You can create a new analog trunk from a template.

### Procedure

1. In the Navigation pane, right click **Line** and select **New from Template > Open**.
2. In the Open window, select a template and click **Open**.
3. In the Template Type Selection window, select the **Service Provider** and then click **Create**.

# Chapter 80: Configuring ARS

When a dialed number matches a short code that specifies that the number should be dialled, there are two methods by which the routing of the outgoing call can be controlled.

## Routing Calls Directly to a Line

Every line and channel has an Outgoing Group ID setting. Several lines and channels can have belong to the same Outgoing Group ID. Within short codes that should be routed via a line within that group, the required Outgoing Group ID is specified in the short code's Line Group ID setting.

## Routing Calls via ARS

The short code for a number can specify an ARS form as the destination. The final routing of the call is then controlled by the setting available within that ARS form.

## ARS Features

| Feature                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Secondary Dial Tone</b>      | The first ARS form to which a call is routed can specify whether the caller should receive secondary dial tone.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Out of Service Routing</b>   | ARS forms can be taken out of service, rerouting any calls to an alternate ARS form while out of service. This can be done through the configuration or using short codes.                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Out of Hours Routing</b>     | ARS forms can reroute calls to an alternate ARS form outside the hours defined by an associated time profile.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Priority Routing</b>         | Alternate routes can be made available to users with sufficient priority if the initial routes specified in an ARS form are not available. For users with insufficient priority, a delay is applied before the alternate routes become available.                                                                                                                                                                                                                                                                                                       |
| <b>Line Types</b>               | ARS can be used with all line types.<br><br>A SIP line is treated as busy and can follow alternate routes based on the SIP line setting <b>Call Initiation Timeout</b> . Previously a SIP line was only seen as busy if all the configured channels were in use.<br><br>IP lines use the NoUser Source Number setting <b>H.323SetupTimerNoLCR</b> to determine how long to wait for successful connection before treating the line as busy and following ARS alternate routing. This is set through the IP line option <b>Call Initiation Timeout</b> . |
| <b>Multi-Site Network Calls</b> | Calls to multi-site extension numbers are always routed using the appropriate network trunk. ARS can be configured for multi-site network numbers but will only be used if the network call fails due to congestion or network failure.                                                                                                                                                                                                                                                                                                                 |
| <b>Main Route</b>               | The ARS form 50, named "Main" cannot be deleted. For defaulted systems it is used as a default route for outgoing calls.                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Routing Calls to ARS

1. Create the ARS form.
2. Create the required system, user or user rights short code to match the user dialing.
  - a. In the **Telephone Number** field, define the digits that will be used to match a short code in the ARS form.
  - b. Use the **Line Group ID** field drop-down to select the ARS form required for routing the call.

## Example ARS Operation

The simplest example for ARS operation are the settings applied to a defaulted system. These vary between U-Law systems and A-Law systems. For Server Edition systems refer to Server Edition Outgoing Call Routing.

### A-Law Systems

This set of defaults is applied to A-Law systems, typically supplied to locales other than North America. The defaults allow any dialing that does not match an internal number to be routed off-switch as follows:

#### 1. **System Short Code - ?/Dial/.50:Main**

The default system short code ? will match any dialing for which no other user, user rights or system short code match is found. This short code is set to route all the digits dialed to ARS form 50.

#### 2. **ARS Form - 50:Main**

This form contains just a single short code.

#### 3. **?/Dial3K1/.0**

This short code matches any digits passed to the ARS form. It then dials the digits out on the first available line within line group 0 (the default outgoing line group for all lines).

## U-Law Systems

This set of defaults is applied to U-Law systems, typically supplied to locales in North America. The defaults route any dialing prefixed with a 9 to the ARS and secondary dial tone.

### 1. System Short Code - 9N/Dial/N/50:Main

The default system short code 9N is used to match any dialing that is prefixed with a 9. It passes any digits following the 9 to ARS form 50.

### 2. ARS Form - 50:Main

This form has secondary dial tone enabled. It contains a number of short codes which all pass any matching calls to the first available line within line group 0 (the default outgoing line group for all lines). Whilst all these short code route calls to the same destination, having them as separate items allows customization if required. The short codes are:

- **11/Dial Emergency/911/0** - This short code matches an user dialing 911 for emergency services.
- **911/Dial Emergency/911/0** - This short code matches an user dialing 9911 for emergency services.
- **0N;/Dial3K1/0N/0** - This short code matches any international calls.
- **1N;/Dial3K1/1N/0** - This short code matches any national calls.
- **XN;/Dial3K1/N/0** - This short code matches 7-digit local numbers. Note: From October 2021, telephony providers in the US have ceased routing 7-digit local numbers.
- **XXXXXXXXXX/Dial3K1/N/0** - This short code matches 10-digit local numbers.

## ARS Operation

The diagram below illustrates the default ARS routing applied to systems defaulted to the **United States** system locale. In summary:

- Any dialing prefixed with 9 will match the default system short code **9N**.
- That short code routes calls to the default ARS form **50:Main**.
- The short codes in that ARS form route all calls to an available line that has its **Outgoing Group ID** set to **0**.

|   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9 | <p>The <b>Dial Delay Count</b> is zero, so the system begins looking for short code matches in the system and user's short codes immediately.</p> <p>Since there is only one match, the <b>9N</b> system short code, it is used immediately.</p> <p>The <b>9N</b> short code is set to route the call to the ARS form <b>Main</b>. It only passes those digits that match the N part of the dialing, ie. the 9 is not passed to the ARS, only any further digits dialed by the user.</p> <p><b>Secondary Dial Tone</b> is selected in the ARS form. Since no digits for ARS short code matching have been received, secondary dial tone is played to the user.</p> |
| 1 | <p>Having received some digits, the secondary dial tone stops.</p> <p>The ARS form short codes are assessed for matches.</p> <p>The <b>11</b> and <b>1N;</b> short codes are possible matches.</p> <p>The <b>911</b> and <b>0N;</b> short codes are not possible matches.</p> <p>The <b>XN;</b> and <b>XXXXXXXXXXN;</b> short codes are also not matches because the <b>1N;</b> short code is already a more exact match.</p> <p>Since there is more than one possible match, the system waits for further digits to be dialed.</p>                                                                                                                                |

Table continues...

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>555</b>       | The <b>11</b> short code is no longer a possible match. The only match is left is the <b>1N;</b> short code.<br><br>The ; in the short code tells the system to wait for the <b>Dial Delay Time</b> to expire after the last digit it received before assuming that dialing has been completed. This is necessary for line providers that expect to receive all the routing digits for a call 'en bloc'. The user can also indicate they have completed dialing by pressing #. |
| <b>707392200</b> | When the dialing is completed, a line that has its <b>Outgoing Group ID</b> set to 0 (the default for any line) is seized.<br><br>If no line is available, the alternate route settings would applied if they had been configured.                                                                                                                                                                                                                                             |

## ARS Short Codes

The short codes in the default ARS form have the following roles:

| Code                     | Feature               | Telephone Number | Line Group ID | Description                                                                                                                                                                                                                                                                                                                 |
|--------------------------|-----------------------|------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>11</b>                | <b>Dial Emergency</b> | <b>911</b>       | <b>0</b>      | These two short codes are used to route emergency calls. A <b>Dial Emergency</b> call is never blocked. If the required line is not available, the system will use the first available line. Similarly, calls using <b>Dial Emergency</b> ignore any outgoing call bar settings that would be normally applied to the user. |
| <b>911</b>               | <b>Dial Emergency</b> | <b>911</b>       | <b>0</b>      |                                                                                                                                                                                                                                                                                                                             |
| <b>0N;</b>               | <b>Dial 3K1</b>       | <b>0N</b>        | <b>0</b>      | Matches international numbers.                                                                                                                                                                                                                                                                                              |
| <b>1N;</b>               | <b>Dial 3K1</b>       | <b>1N</b>        | <b>0</b>      | Matches national numbers.                                                                                                                                                                                                                                                                                                   |
| <b>XN;</b>               | <b>Dial 3K1</b>       | <b>N</b>         | <b>0</b>      | Matches 7 digit local numbers.                                                                                                                                                                                                                                                                                              |
| <b>XXXXXXXXX<br/>XN;</b> | <b>Dial 3K1</b>       | <b>N</b>         | <b>0</b>      | Matches 10 digit local numbers.                                                                                                                                                                                                                                                                                             |

### ARS Short Code Settings

- **Code** The digits used for matching to the user dialing.
- **Feature** ARS short codes can use any of the **Dial** short code features or the **Barred** feature. When a **Barred** short code is matched, the call will not proceed any further.
- **Telephone Number** The number that will be output to the line as the result of the short code being used as the match for the user dialing. Short code characters can be used such as N to match any digits dialed for N or X in the **Code**.
- **Line Group ID** The line group from which a line should be seized once short code matching is completed. Another ARS form can also be specified as the destination.
- **Locale** Not used for outgoing external calls.

- **Forced Account Code** If enabled, the user will be prompted to enter a valid account code before the call can continue. The account code must match one set in the system configuration.

## Simple Alternate Line Example

Using the default ARS settings, despite having several short codes in the ARS form, all outgoing calls are actually routed the same way using the same trunks. However, by having separate short codes for different call types present, it is easy to change the routing of each call type if required.

For this example, the customer has separate sets of lines for local calls and for national/international calls. These have been configured as follows:

- The lines for local and emergency calls have been left with the default **Outgoing Group ID** of **0**.
- The lines for national and international calls have been set with the **Outgoing Group ID** of **1**.

The default ARS can be configured to match this by just changing the **Line Group ID** settings of the default ARS short codes to match.

**Short Code** (9x)

|                    |                          |

## Simple Call Barring

All ARS short codes use one of the **Dial** short code features. The exception is the **Barred** short code feature. This can be selected for ARS short codes that match dialing that is not allowed.

In the example below, any user dialing an international number will be routed to the **Barred** short code. This prevents the dialing of external numbers prefixed with 0.

## User Priority Escalation

User priority can be used to alter call routing when the required route is not available.

In this example, international calls are initially targeted to seize a line in outgoing line group 1. However an alternate route has been defined which will be used if no line in line group 1

is available. The fallback ARS form allows international calls to seize a line from line group 0. Whether this is done immediately or after a delay is set by whether the users priority is high enough.

# Time Based Routing

Time profiles can be used to switch call routing from one ARS form to another.

In the example below, a time profile has been define that sets the hours for normal operation. Outside the times set in the time profile, the other ARS form is used. This other ARS form only allows local and emergency calls.

**Short Code**

Code: 9N

# Account Code Restriction

The short codes within an ARS form can be individually set to require an account code before allowing any call that matches it to proceed.

In the example below, the short code for international calls has been set to require the user to enter an account code. A valid account code must be dialed to continue with the call.

**Short Code**

Code: 9N  
Feature: Dial  
Telephone Number: N  
Line Group Id: 50: Main  
Locale:   
Force Account Code: ☐

**Short Code**

Code: 0N;  
Feature: Dial 3K1  
Telephone Number: 0N  
Line Group Id: 0  
Locale:   
Force Account Code: ☒

**ARS**

ARS Route Id: 50  
Route Name: Main  
Dial Delay Time: System Default (4)  
In Service: ☒ Out of Service Route: <None>  
Time Profile: <None> Out of Hours Route: <None>  
Secondary Dial tone: ☒ SystemTone  
Check User Call Barring: ☒

| Code        | Telephone Number | Feature        | Line Group Id |
|-------------|------------------|----------------|---------------|
| 11          | 911              | Dial Emergency | 0             |
| 911         | 911              | Dial Emergency | 0             |
| 0N;         | 0N               | Dial 3K1       | 0             |
| 1N;         | 1N               | Dial 3K1       | 0             |
| XN;         | N                | Dial 3K1       | 0             |
| XXXXXXXXXXN | N                | Dial 3K1       | 0             |

Alternate Route Priority Level: 3  
Alternate Route Wait Time: 30  
Alternate Route: <None>

If a user should always enter an account code to make any external call, the user option Force Account Code should be used.

# Tiered ARS Forms

It is possible for an ARS short code in one form to have another ARS form as its destination. Dialing that matches the short code is then subject to further matching against the short codes in the other ARS form.

In the example below, the user wants different routing applied to international calls based on the country code dialed. To do that in the default ARS form would introduce a large number of short codes in the one form, making maintenance difficult.

So the short code matching calls with the international dialing prefix 0 has been set to route matching calls to another ARS form. That form contains short codes for the different country dialing codes of interest plus a default for any others.

## Planning ARS

Using the methods shown in the previous examples, it is possible to achieve ARS that meets most requirements. However the key to a good ARS implementation is planning.

A number of questions need to be assessed and answered to match the system's call routing to the customer's dialing.

**What** What numbers will be dialed and what needs to be output by the system. What are the different call tariffs and the dialing codes.

**Where** Where should calls be routed.

**Who** Which users should be allowed to use the call routes determined by the previous questions.

**When** When should outgoing external calls be allowed. Should barring be applied at any particular times? Does the routing of calls need to be adjusted for reasons such as time dependant call tariffs.

# Chapter 81: Call Barring

## Related links

[Applying Call Barring](#) on page 825

[Overriding call barring](#) on page 826

---

## Applying Call Barring

Call barring can be applied in a number of ways.

### **Barring a User From Receiving Any External Calls:**

For each user, the **Incoming Call Bar** setting (**User | Telephony | Supervisor Settings**) can be selected to stop that user from receiving any external calls.

### **Barring a User From Making Any External Calls:**

For each user, the **Outgoing Call Bar** setting (**User | Telephony | Supervisor Settings**) can be selected to stop that user from making any external calls.

### **Barring Particular Numbers/Number Types:**

System short codes are used to match user dialing and then perform a specified action. Typically the action would be to dial the number to an external line. However, short codes that match the dialing of particular numbers or types of numbers can be added and set to another function such as Busy. Those short codes can be added to a particular user, to a User Rights associated with several users or to the system short codes used by all users.

The system allows short codes to be set at user, user rights, system and least cost route. These have a hierarchy of operation which can be used to achieve various results. For example a system short code for a particular number can be set to busy to bar dialing of that number. For a specific user, a user short code match to the same number but set to Dial will allow that user to override the system short code barring.

### **Using Account Codes:**

The system configuration can include a list of account codes. These can be used to restrict external dialing only to users who have entered a valid account code.

- **Forcing Account Code Entry for a User:** A user can be required to enter an account code before the system will return dialing tone. The account code that they enter must match a valid account code stored in the system configuration. The setting for this is **Force Account Code** (**User | Telephony | Supervisor Settings**)

- **Forcing Account Code Entry for Particular Numbers:** Each system short code has a Force Account Code option. Again the account code entered must match a valid account code stored in the system configuration. for the call to continue.

### Barring External Transfers and Forwards:

A user cannot forward or transfer calls to a number which they cannot normally dial. In addition there are controls which restrict the forwarding or transferring of external calls back off-switch. See [Off-Switch Transfer Restrictions](#) on page 906.

### Related links

[Call Barring](#) on page 825

---

## Overriding call barring

When a system or user short code is configured to bar outgoing calls, you can override call barring. Typically, this configuration is used for a phone in a shared or public area. By default, the phone has outgoing calls barred. The administrator can override call barring for specific dialed numbers by entering numbers with a record in the external directory. When the dialed number exists in the external directory and the **Directory Overrides Call Barring** setting is enabled, call barring is overridden.

The System Directory entries must use the format (shortcode)number. For example, if the number to dial is 61234, where 6 is the shortcode used to dial externally and 1234 is the number, the System Directory entry must be (6)1234. If the dial shortcode contains a name string rather than digits, then **Directory Overrides Call Barring** will not work.

The **Directory Overrides Barring** setting is located on the **System | Telephony | Telephony** tab.

For information on the directory, see the description for the **System | Directory Services** tab.

### Server Edition configuration

For Server Edition deployments, the **Directory Overrides Barring** must be enabled on each node. It is not a system wide setting.

For example, if the Primary Server uses an IP500 V2 expansion system as an ISDN gateway, **Directory Overrides Barring** must be enabled on the Primary Sever for Primary Server users dialing on external ISDN lines. For the IP500 V2 expansion users, **Directory Overrides Barring** must be enabled on the IP500 V2 expansion system.

It is recommend that the short code configured to dial externally on ISDN lines be the same on all nodes. For example, if Primary Server users and IP500 V2 expansion users want to reach PSTN number 123456789 on ISDN lines, configure the dial codes as follows.

- Primary Server: 6N/Dial/6N/XX (XX is the line group ID for the SCN line)
- IP500 V2 expansion: 6N/Dial/N/YY (YY is the line group ID for ISDN line)
- Directory Entry number defined on Primary Server: (6)123456789

# Chapter 81: Configuring authorization codes

**Note:**

For Release 9.1 and higher, you can no longer associate **Authorization Code** entries with **User Rights**. **Authorization Code** configured in that way are removed during the upgrade.

Authorization codes are enabled by default.

A user dials a number that matches a short code set to **Force Authorization Code**. The user is prompted to enter an authorization code.

They dial their authorization code. If a matching entry is found in **Authorization Codes** records the system checks the corresponding user. Note that the user checked does not necessarily need to be connected with the user dialing or the user whose extension is being used to make the call.

The dial string is checked against the short codes with the matching user. If it matches a dial short code or no short code the call is allowed, otherwise it is blocked. Note that the short code is not processed, it is just checked for a match. If multi-tier authorization codes are required there must be blocking (busy) short codes (or a wild card '?' )

**Example:**

A restaurant has a number of phones in publicly accessible areas and want to control what calls can be made by staff. Staff must not be able to dial long distance numbers. staff should be able to dial local and cell phone numbers.

|                                                                                                                                                                                                                          |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ARS Table</b>                                                                                                                                                                                                         |
| In the Main (50) ARS table, add the following short codes: <ul style="list-style-type: none"><li>• 04XXXXXXXXXX/Dial/044N/</li><li>• 01XXXXXXXXXX/Dial/01N/Force Auth Code checked</li></ul>                             |
| <b>Authorization Codes</b>                                                                                                                                                                                               |
| Configure an authorization code for each staff member that is allowed to make long distance calls. For example, for staff members Alice and Bob:<br><br>AuthCode: <b>2008 - Alice</b><br><br>AuthCode: <b>1983 - Bob</b> |

It is recommended to use short codes that use X characters to match the full number of characters to be dialed. That ensures that authorization code entry is not triggered until the full number has been dialed rather than mid-dialing. For example 09 numbers are premium rate in the UK, so you

would create a **09XXXXXXXXX/Dial/N** short code set to Forced Authorization. In the associated user or user right short code it is recommended to use 09N type short codes.

System short codes that route to ARS will not have their **Force Authorization Code** setting used. However short codes within an ARS table will have their **Force Authorization Code** setting used.

## Forcing Authorization Codes

There are two methods to force a user to enter an authorization code in order to complete dialing an external call.

- **To Force Authorization Codes on All External Calls** A user can be required to enter an authorization code for all external calls. This is done by selecting Force Authorization Code (**User | Telephony | Supervisor Settings**).
- **To Force Authorization Codes on Specific Calls** To require entry of an authorization code on a particular call or call type, the Force Authorization Code option should be selected in the short code settings. This can be used in user or system short codes in order to apply its effect to a user or all users respectively. You need to ensure that the user cannot dial the same number by any other method that would by pass the short code, for example with a different prefix.

### Related links

[Entering an Authorization Code](#) on page 828

---

## Entering an Authorization Code

Where possible, when an authorization code is required, the user can enter it through their phones display. However, this is not possible for all type of phone, for example it is not possible with analog phones and Avaya XX01 or XX02 phones. The users of these device must either enter the authorization code using a short code set to the Set Authorization Code feature immediately before making the call.

When entry of an authorization code is triggered, the user can enter any authorization code with which they are directly associated.

Note the following.

- If authorization code entry is setup for a particular number, calls forwarded or transferred to that number will also trigger authorization code entry.
- On systems using line appearances to BRI trunk channels to make outgoing calls, authorization code entry may not be triggered. This can be resolved by adding a short code such as [9]XN;/Dial/XN/0 (adjust the prefix and line group as necessary).

[Configuring authorization codes](#) on page 827

# Chapter 81: Preventing Toll Bypass

Use this procedure to prevent toll bypass in Enterprise Branch and Small Community Network (SCN) deployments. Toll bypass is prevented by only allowing PSTN calls where the originating location and terminating location are the same.

The location of non-IP lines is the same as the system location. If an IP address is not resolved to any location, then that device is assumed to be in the system location. The location of public IP lines must be configured to same as PSTN termination location.

The **Location** field for extensions with simultaneous login must be automatic and the location tab must be properly configured for the IP range.

**Enterprise Branch deployments:** All the distributed users must be in the same location as system location. Users registering from a location different from the system location are not supported.

## Procedure

1. In the navigation pane on the left, select **System**.
2. In the details pane, click the **Telephony** tab.
3. Under **Telephony**, click the **Telephony** tab.
4. On the **Telephony** tab:
  - a. Click the check box to turn **Restrict Network Interconnect** on.
  - b. Click the check box to turn **Include location specific information** on.

Setting the two configuration setting on the **Telephony** tab adds a **Network Type** field to the configuration settings for each trunk.

5. For Enterprise Branch deployments, open the **SM Line | Session Manager** tab. For SCN deployments, open the **IP Office Line | Line** tab.
6. If the line is a PSTN trunk (includes SIP), set **Network Type** to **Public**. If the line is an enterprise trunk, set the **Network Type** to **Private**.
7. If the **Network Type** is **Private**, the **Include location specific information** field is available.

If the line is connected to an Avaya Aura® system release 7.0 or higher, or an IP Office release 9.1 or higher, set **Include location specific information** to **On**.

[Configuring unknown locations](#) on page 830

---

## Configuring unknown locations

Use this procedure to configure extensions where the location is unknown.

### Procedure

1. In the navigation pane, select **Location**.
2. Enter a **Location Name**.
3. Set **Parent Location for CAC** to **Cloud**.
4. In the **Extension > Extn** tab, set the **Location** field to the location defined in step 2.

[Preventing Toll Bypass](#) on page 829

# Chapter 81: Configuring Call Admission Control

Call Admission Control (CAC) is a method of controlling system resources using defined locations. Calls into and out of each location are allowed or disallowed based upon configured call constraints. In Manager, use the **Location** tab to define a location and configure the maximum calls allowed for the location.

## Related links

[Manager location tab](#) on page 831

[Assigning a network entity to a location](#) on page 832

[System actions at maximum call threshold](#) on page 832

[Example](#) on page 833

---

## Manager location tab

### Configuring location settings

On the Manager **Location** tab, set the following parameters for a location:

- Location Name
- Subnet Address
- Subnet Mask

### Configuring Call Admission Control settings

On the Manager Location tab, set the following CAC parameters:

- **Internal Maximum Calls:** Calls that pass from the location to another configured location.
- **External Maximum Calls:** Calls that pass from the location to an unmanaged location.
- **Total Maximum Calls:** The total internal and external calls permitted.

## Related links

[Configuring Call Admission Control](#) on page 831

---

## Assigning a network entity to a location

The **Location** field is a drop down list of locations defined on the **Location** tab. Network entities are assigned to a location using the **Location** field on the following Manager tabs.

- **System**
- **Extension**
- **SIP Line | VoIP**
- **H323 Line | VoIP**

The following default settings are applied.

- Each IP Office system can be configured with a defined location. For Server Edition deployments, the configuration of locations is done solution wide. All IP Office systems in the solution share the same location configuration.
- Digital phones default to the system location.
- The default setting for IP phones is **Automatic**. Phones registering from a subnet matching that of a location will be treated as within that location. Otherwise, the phone is assigned the same location as the system. Cloud can be used for phones whose Location is variable or unknown.
- IP Lines default to **Cloud**.

### Related links

[Configuring Call Admission Control](#) on page 831

---

## System actions at maximum call threshold

- A congestion alarm is raised.
- Calls that exceed the CAC maximum values are not allowed.
- Calls from extensions to public trunks through Alternate Route Selection (ARS) are queued and display **Waiting for Line**.
- Calls from extensions to public trunks which do not route through ARS receive a fast-busy tone and display **Congestion**.
- Idle phones display **Emergency/Local calls only**.
- Alternative routing to a local PSTN gateway follows ARS priority escalation rules.
- SIP calls that would exceed call limits and have no other targets are declined with **cause=486** or **cause = 503**.

### Allowed calls

When CAC limits have been reached, the following calls are allowed.

- Emergency calls are always allowed.

- Established calls are never torn down to achieve limits.
- A phone on a remote site that parks a call is always allowed to retrieve it.
- Request Coaching Intrusion calls are allowed.

**Related links**

[Configuring Call Admission Control](#) on page 831

---

## Example

The example configuration has four locations.

| Location | Max Calls |
|----------|-----------|
| HQ       | 20        |
| RS1      | 5         |
| RS2      | 10        |
| RS3      | 15        |
| +Cloud   | unlimited |

SIP Line 10 and SIP Line 11 are configured with 20 channels.

### Notes

- Calls between location RS1 and SBC113 do not increment the call count for HQ.
- The HQ call count includes calls across the HQ boundary which anchor media inside HQ. SBC113 and SBC 114 are both included.
- The HQ maximum calls value is separate and complementary to the individual trunk call maximum.
- Incoming calls from SIP to RS1 (direct media) only need to verify that the RS1 location maximum call value is not exceeded.
- SIP calls that are not allowed to RS1 may go to HQ voicemail if the HQ call limit is not exceeded.

## User Management Overview

Users are the people who use the system. They do not necessary have to be an extension user, for example users are used for RAS dial in data access. In addition, more users can be created than there are extensions, with users logging in to an extension when they want to receive calls.

By default, a user is automatically created to match each extension. They are numbered from 201 upwards and the first 16 are placed in the hunt group Main (200), which is the default destination for incoming calls.

### Terminology

**Standard User:** A standard user.

**Centralized User:** Centralized users can be provisioned for enterprise branch deployments.

**No User:** Used to apply settings for extensions which currently have no associated user. The **SourceNumbers** settings of the **NoUser** user is used to configure a number of special options. These are then applied to all users on the system.

**Remote Manager:** Used as the default settings for dial in user connections.

**Hot Desking User:** Users with a Login Code can move between extensions by logging in and off.

### Deleting a User

When a user is deleted, any calls in progress continue until completed. The ownership of the call is shown as the NoUser user. Merging the deletion of a user causes all references to that deleted user to be removed from the system.

### Changing a User's Extension

Changing a user's extension number automatically logs the user in on the matching base extension if available and the user doesn't have Forced Login enabled. If **Forced Login** is enabled, then the user remains on the current extension being used until they log out and log in at the new extension.

Note that changing a user's extension number affects the user's ability to collect Voicemail messages from their own extension. Each user's extension is set up as a "trusted location" under the Source Numbers tab of the User configuration form. This "trusted location" allows the user to dial \*17 to collect Voicemail from his own extension. Therefore if the extension number is changed so must the "trusted location".

The following related configuration items are automatically updated when a user extension is changed:

- User, Coverage and Bridged Appearance buttons associated with the user.
- Hunt group membership (disabled membership state is maintained).
- Forwards and Follow Me's set to the user as the destination.
- Incoming call routes to this destination.
- Dial in source numbers for access to the user's own voicemail.
- Direct call pickup buttons are updated.
- The extension number of an associated extension is updated.

### Server Edition User Management

In a Server Edition network, individual users are still added to the configuration of a particular server. Typically they are added to the configuration of the server that hosts the user's physical extension or supports their main place of work. That server is treated as the host system for the user. However, once a user is added to the configuration of a particular system, you can use Manager and Web Manager to manage all users in the Server Edition solution.

### Centralized User Management

**Centralized Users** are provisioned for enterprise branch deployments. **Centralized Users** are registered with Session Manager and are able to utilize telephony features provided by Communication Manager. The **Centralized User** profile is applicable to both SIP and analogue extensions. For more information, see *Administering Centralized Users for an IP Office™ Platform Enterprise Branch*. The following requirements must be met when provisioning a centralized user:

- An SM line must be configured on the system.
- The user must be provisioned with an existing extension.
- The extension **Base Extension** value must match the centralized extension value.
- Centralized users must be configured with a password for SIP registration on Session Manager. The password is set in User | Telephony | Supervisor Settings | Login Code field.

[Configure User Settings](#) on page 835

---

## Configuring Gmail Integration

You can integrate the Google Gmail application into Voicemail Pro in order to use a Gmail account for voicemail to email functions. The supported functions are:

- **Forward:** Voicemail messages are sent as email to the Gmail account of a user. Users can use Gmail to retrieve and manage emails.
- **Copy:** Copies of voicemail messages are sent as email to the Gmail account of a user. The message is also stored locally on the Voicemail Pro server.
- **Alert:** An email is sent to the Gmail account of a user indicating the arrival of a new voicemail.

For the forwarding function:

- Up to 250 users are supported.
- The maximum message length is 7 minutes or 14 minutes when using companded.
- Messages can be accessed using Visual Voice but not one-X Communicator.

#### Related links

[Configure User Settings](#) on page 835

---

## Call Intrusion

The IP Office system supports several different methods for call intrusion. The method used affects which parties can hear each other. Intrusion features are supported across a multi-site network.

- Intrusion features are controlled by the **Can Intrude** setting of the user intruding and the **Cannot Be Intruded** setting of user being intruded on. By default, no users can intrude and all users cannot be intruded.
- Intrusion features uses system conference resources during the call. If insufficient conference resource are available, the feature cannot be used.

**Warning:**

- Listening to a call without the other parties being aware is subject to local regulations. You must ensure that you have complied with the local regulations. Failure to do so can result in penalties.

In the examples below, A has called or is calling IP Office user B. A can be internal or external. User C invokes one of the call intrusion methods targeting user B.

| Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Privacy Settings Used                                                                 |                    |              |

## Call Tagging

Call tagging associates a text string with a call. That string remains with the call during transfers and forwards. That includes calls across a multi-site network.

On Avaya display phones, the text is shown whilst a call is alerting and is then replaced by the calling name and number when the call is connected. On analog phones with a caller ID display, the tag text replaces the normal caller information.

Applications such as SoftConsole display any call tag associated with a call. If the call is parked, the tag is shown on the call park slot button used. A call tag can be added when making a call using SoftConsole or one-X Portal. A tag can be added to a call by an Incoming Call Route or by an Voicemail Pro Assisted Transfer action.

## Call Waiting

Call waiting allows a user who is already on a call to be made aware of a second call waiting to be answered.

### User Call Waiting

Call waiting is primarily a feature for analog extension users. The user hears a call waiting tone and depending on the phone type, information about the new caller may be displayed. The call waiting tone varies according to locale.

For Avaya feature phones with multiple call appearance buttons, call waiting settings are ignored as additional calls are indicated on a call appearance button if available.

To answer a call waiting, either end the current call or put the current call on hold, and then answer the new call. Hold can then be used to move between the calls.

Call waiting for a user can be enabled through the system configuration (User | Telephony | Call Settings | Call Waiting On) and through programmable phone buttons.

Call waiting can also be controlled using short codes. The following default short codes are available when using Call Waiting.

**\*15 - Call Waiting On** Enables call waiting for the user.

**\*16 - Call Waiting Off** Disables call waiting for the user.

**\*26 - Clear Call and Answer Call Waiting** Clear the current call and pick up the waiting call.

Hunt Group Call Waiting

Call waiting can also be provided for hunt group calls. The hunt group **Ring Mode** must be **Collective Call Waiting**.

On phones with call appearance buttons, the call waiting indication takes the form of an alert on the next available call appearance button. On other phones, call waiting indication is given by a tone in the speech path (the tone is locale specific).

The user's own **Call Waiting** setting is overridden when they are using a phone with call appearances. Otherwise the user's own **Call Waiting** setting is used in conjunction with the hunt group setting.

## Call Barring

Call barring can be applied in a range of ways.

### Barring a User From Receiving Any External Calls

For each user, **User > Telephony > Supervisor Settings > Incoming Call Bar** can be selected to stop that user from receiving any external calls.

### Barring a User From Making Any External Calls

For each user, **User > Telephony > Supervisor Settings > Outgoing Call Bar** can be selected to stop that user from making any external calls.

### Barring Particular Numbers/Number Types

The system allows short codes to be set at user, user rights, system and least cost route. These have a hierarchy of operation which can be used to achieve various results. For example a system short code for a particular number can be set to busy to bar dialing of that number. For a specific user, a user short code match to the same number but set to Dial will allow that user to override the system short code barring.

System short codes are used to match user dialing and then perform a specified action. Typically the action would be to dial the number to an external line. However, short codes that match the dialing of particular numbers or types of numbers can be added and set to another function such as Busy. Those short codes can be added to a particular user, to a User Rights associated with several users or to the system short codes used by all users.

### Using Account Codes

The system configuration can include a list of account codes. These can be used to restrict external dialing only to users who have entered a valid account code.

- **Forcing Account Code Entry for a User** - A user can be required to enter an account code before the system will return dialing tone. The account code that they enter must

match a valid account code stored in the system configuration. The setting for this is **User > Telephony > Supervisor Settings > Forced Account Code**.

- **Forcing Account Code Entry for Particular Numbers** - Each system short code has a **Force Account Code** option. Again the account code entered must match a valid account code stored in the system configuration. for the call to continue.

### Barring External Transfers and Forwards

A user cannot forward or transfer calls to a number which they cannot normally dial. In addition there are controls which restrict the forwarding or transferring of external calls back off-switch. See [Off-Switch Transfer Restrictions](#) on page 906.

## Centralized Call Log

The IP Office stores a centralized call log for each user:

- The user's centralized call log is stored by the IP Office system on which the user is configured. If the user is logged in on another system, new call log records are sent to the user's home IP Office system, but using the time and date on the IP Office system where the user is logged in.
- Each user's centralized call log can contain 30 (IP500 V2) or 60 (Server Edition) call records. Each new call record replaces the oldest previous record when it reaches the limit.
- By default, the centralized call log is displayed on Avaya phones with a fixed **Call Log** or **History** button (1400, 1600, 9400, 9500, 9600, and J100 Series) and in the one-X Portal, Avaya Workplace Client, and IP Office User Portal applications.
- The centralized call log moves with the user as they log onto different phones and IP Office applications.
- The missed call count is updated per unique caller, not per call.

### Adjusting Call Log Operation

The operation of the centralized call log is control by the **System > Telephony > Call Log** and **User > Telephony > Call Log** settings.

## Centralized Personal Directory

Each system user is able to have up to 250 personal directory records stored by the system. A user's personal directory is also usable with 1400, 1600, 9400, 9500, 9600, and J100 Series phones with a **CONTACTS** button. The user can view these records and use them to make calls.

Phone users can edit their personal directory records through the phone. The user personal directory records can be edited by administrator through the **User > Personal Directory** menu in IP Office Manager and IP Office Web Manager. Users can edit their personal directory through their phone or using the user portal application.

When the user hot desks to another phone that supports the centralized personal directory, their personal directory records become accessible through that phone. That also includes hot desking to another system in the network.

## Account Code Configuration

### Forcing Account Code Entry for Specific Numbers

You can make entry of an account code a requirement for any dialing that matches a particular short code. This is done by ticking the **Force Account Code** option found in the short code settings.

Note that the account code request happens when the short code match occurs. Potentially this can be in the middle of dialing the external number, therefore the use of **X** wildcards in the short code to ensure full number dialing is recommended.

### Entering Account Codes

The method for entering account codes depends on the type of phone being used. Refer to the relevant telephone User's Guide for details.

#### Account Code Button:

The Account Code Entry action (**User | Button Programming | Emulation | Account Code Entry**) and Set Account Code action (**User | Button Programming | Advanced | Set | Set Account Code**) can be assigned to a programmable button on some phones. They both operate the same. The button can be preset with a specific account code or left blank to request account code entry when pressed. The button can then be used to specify an account code before a call or during a call.

### Setting an Account Code using Short Codes:

The **Set Account Code** feature allows short codes to be created that specify an account code before making a call.

### Show Account Code Setting :

This setting on the **System | Telephony | Telephony** tab controls the display and listing of system account codes.

When on and entering account codes through a phone, the account code digits are shown while being dialed.

When off and entering account codes through a phone, the account code digits are replaced by **s** characters on the display.

### Server Edition Account Code Management

Accounts codes configured on Server Edition are shared by all systems in the network.

## Setting a User to Forced Account Code

### Procedure

1. Receive the system configuration if one is not opened.
2. In the left-hand panel, click **User**. The list of existing user is shown in the right-hand panel.
3. Double-click the required user.
4. Select the **Telephony** tab.
5. Tick the Force Account Code option.
6. Click **OK**.
7. Merge the configuration.

## Malicious Call Tracing (MCID)

MCID (Malicious Caller ID) is an ISDN feature. It is supported on BRI and PRI trunks to ISDN service provider who provide MCID.

When used, it instructs the ISDN exchange to perform a call trace on the user's current call and to keep a record of the call trace at the exchange for the legal authorities. Trace information is not provided to or displayed by the system or system phones.

The use of MCID is subject to local and national legal requirements that will vary. The feature may also not be enabled until specifically requested from the service provider. You should consult with your ISDN service provider and with appropriate legal authorities before attempting to use MCID.

### **Note:**

Currently, in Server Edition network, MCID is only supported for users using an MCID button and registered on the same IP500 V2 Expansion system as the MCID trunks.

### Activating MCID

1. **Liaise with the ISDN Service Provider** MCID should not be used without first confirming its usage with the ISDN service provider.
2. **Enabling MCID Call Tracing on a Line** BRI and PRI lines include a **Support Call Tracing Option** which by default is off.
3. **Enabling MCID Call Tracing for a User** Each user has a **Can Trace Calls (User | Telephony | Supervisor Settings)** option. This option is off by default.
4. **Providing an Active MCID Control** The user needs to be provided with a mechanism to trigger the MCID call trace at the exchange. This can be done using either a short code or a programmable button.
  - **MCID Activate Button** The action **MCID Activate (Advanced | Miscellaneous | MCID Activate)** can be assigned to a programmable buttons. It allows a malicious call trace to be triggered during a call.
  - **MCID Activate Short Codes** The feature **MCID Activate** can be used to create a short code to triggering a malicious call trace.

## Twinning

Twinning allows a user's calls to be presented to both their current extension and to another number. The system supports two modes of twinning:

|                             | Internal                 | Mobile                 |
|-----------------------------|--------------------------|------------------------|
| <b>Twinning Destination</b> | Internal extensions only | External numbers only. |
| <b>Supported in</b>         | All locales.             | All locales.           |
| <b>License Required</b>     | No                       | No                     |

User BLF indicators and application speed dials set to the primary user will indicate busy when they are connected to a twinned call including twinned calls answered at the mobile twinning destination.

## Do Not Disturb and Twinning

### Mobile Twinning

Selecting DND disables mobile twinning.

### Internal Twinning

- Logging out or setting do not disturb at the primary stops twinned calls alerting at the secondary also.
- Logging out or setting do not disturb at the secondary only affects the secondary.

### Do Not Disturb Exceptions List

For both types of twinning, when DND is selected, calls from numbers entered in the user's Do Not Disturb Exception List are presented to both the primary and secondary phones.

### Internal Twinning

Internal twinning can be used to link two system extensions to act as a single extension. Typically this would be used to link a users desk phone with some form of wireless extension such as a DECT or WiFi handset.

Internal twinning is an exclusive arrangement, only one phone may be twinned with another. When twinned, one acts as the primary phone and the other as the secondary phone. With internal twinning in operation, calls to the user's primary phone are also presented to their twinned secondary phone. Other users cannot dial the secondary phone directly.

- If the primary or secondary phones have call appearance buttons, they are used for call alerting. If otherwise, call waiting tone is used, regardless of the users call waiting settings. In either case, the **Maximum Number of Calls** setting applies.
- Calls to and from the secondary phone are presented with the name and number settings of the primary.
- The twinning user can transfer calls between the primary and secondary phones.
- Logging out or setting do not disturb at the primary stops twinned calls alerting at the secondary also.
- Logging out or setting do not disturb at the secondary only affects the secondary.
- User buttons set to monitor the status of the primary also reflect the status of the secondary.
- Depending on the secondary phone type, calls alerting at the secondary but then answered at the primary may still be logged in the secondary's call log. This occurs if the call log is a function of the phone rather than the system.

- Call alerting at the secondary phone ignoring any **Ring Delay** settings applied to the appearance button being used at the primary phone. The only exception is buttons set to No Ring, in which case calls are not twinned.

The following applies to internal twinned extensions:

If using a 1400, 1600, 9400, 9500, or 9600 Series phone as the secondary extension:

- The secondary extension's directory/contacts functions access the primary user's Centralized Personal Directory records in addition to the Centralized System Directory.
- The secondary extension's call Log/call List functions access the primary user's Centralized Call Log.
- The secondary extension's redial function uses the primary users Centralized Call Log. Note that the list mode or single number mode setting is local to the phone.

It is also shown on 3700 Series phones on an Avaya Wireless DECT system installed using system provisioning .

For all phone types, changing the following settings from either the primary or secondary extension, will apply the setting to the primary user. This applies whether using a short code, programmable button or phone menu. The status of the function will be indicated on both extensions if supported by the extension type.

- Forwarding settings.
- Group membership status and group service status.
- Voicemail on/off.
- Do Not Disturb on/off and DND Exceptions Add/Delete.

## Mobile Twinning

This method of twinning can be used with external numbers. Calls routed to the secondary remain under control of the system and can be pulled back to the primary if required. If either leg of an alerting twinned call is answered, the other leg is ended.

Mobile twinning is only applied to normal calls. It is not applied to:

- Intercom, dial direct and page calls.
- Calls alerting on line appearance, bridged appearance and call coverage buttons.
- Returning held, returning parked, returning transferred and automatic callback calls.
- Follow me calls.
- Forwarded calls except if the user's **Forwarded Calls Eligible for Mobile Twinning** setting is enabled.
- Hunt group calls except if the user's **Hunt Group Calls Eligible for Mobile Twinning** setting is enabled.
- Additional calls when the primary extension is active on a call or the twinning destination has a connected twinned call.

A number of controls are available in addition to those on this tab.

### Button Programming Actions:

The **Emulation | Twinning** action can be used to control use of mobile twinning. Set on the primary extension, when that extension is idle the button can be used to set the twinning

destination and to switch twinning usage on/off. When a twinned call has been answered at the twinned destination, the button can be used to retrieve the call at the primary extension.

### Mobile Twinning Handover:

When on a call on the primary extension, pressing the **Twinning** button will make an unassisted transfer to the twinning destination. This feature can be used even if the user's **Mobile Twinning** setting was not enabled.

- During the transfer process the button will wink.
- Pressing the twinning button again will halt the transfer attempt and reconnect the call at the primary extension.
- The transfer may return if it cannot connect to the twinning destination or is unanswered within the user's configured **Transfer Return Time** (if the user has no **Transfer Return Time** configured, a enforced time of 15 seconds is used).

### Short Code Features:

The following short code actions are available for use with mobile twinning.

- **Set Mobile Twinning Number.**
- **Set Mobile Twinning On.**
- **Set Mobile Twinning Off.**
- **Mobile Twinned Call Pickup.**

## Private Calls

This feature allows users to mark a call as being private.

When on, any subsequent calls cannot be intruded on until the user's private call status is switched off. The exception is Whisper Page which can be used to talk to a user on a private call.

Note that use of private calls is separate from the user's intrusion settings. If the user's **Cannot be Intruded** (User | Telephony | Supervisor Settings) setting is enabled, switching private calls off does not affect that status. To allow private calls to be used to fully control the user status, **Cannot be Intruded** (User | Telephony | Supervisor Settings) should be disabled for the user.

Use of private calls can be changed during a call. Enabling privacy during a call will stop any current recording, intrusion or monitoring. Privacy only applies to the speech part of the call. Call details are still recorded in the SMDR output and other system call status displays.

**Button Programming** The button programming action **Advanced | Call | Private Call** can be used to switch privacy on/off. Unlike the short code features it can be used during a call to apply or remove privacy from current calls rather than just subsequent calls. On suitable phones the button indicates the current status of the setting.

**Short Codes** A number of short code features are available for privacy.

- **Private Call** Short codes using this feature toggle private status on/off for the user's subsequent calls.
- **Private Call On** Short codes using this feature enable privacy for all the user's subsequent calls until privacy is turn off.
- **Private Call Off** Short codes using this feature switch off the user's privacy if on.

## System Phone Features

The user option **System Phone Rights** (User | User) can be used to designate a user as being a system phone user. System phone users can access a number of additional function not available to other phone users. Note that if the user has a login code set, they are prompted to enter that code in order to access these features.

| Setting        | Description                                                                                                                                                                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>None</b>    | The user cannot access any system phone options.                                                                                                                                                                                                                     |
| <b>Level 1</b> | The user can access all system phone options supported on the type of phone they are using except system management and memory card commands.                                                                                                                        |
| <b>Level 2</b> | The user can access all system phone options supported on the type of phone they are using including system management and memory card commands. Because of the nature of the additional commands, you should set a user login code for the user to restrict access. |

### System Phone Functions

The following functions are supported:

| Feature                                 | Description                                                                                                                                                                                                        |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MENU to set date/time</b>            | Restricted to 4412, 4424, 6408, 6416 and 6424 phones where supported by the system. On these phones, a system phone user can manually set the system date and time by pressing <b>Menu   Menu   Func   Setup</b> . |
| <b>Change Login Code of Other Users</b> | Using a short code with the Change Login Code feature, system phone users can change the login code of other users on the system.                                                                                  |
| <b>Outgoing Call Bar Off</b>            | Using a short code with the Outgoing Call Bar Off feature, system phone users can switch off the outgoing call bar status of other users on the system.                                                            |

The following commands are only supported using 1400, 1600, 9400, 9500, 9600, and J100 Series phones. Due to the nature of the commands a login code should be set for the user to restrict access. The commands are accessed through the **Features | Phone User | System Administration** menu. For full details refer to the appropriate phone user guide.

| Feature                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Edit System Directory Records</b>                          | Using a 1400, 1600, 9400, 9500, or 9600 Series phone, a system phone user can edit system directory records stored in the configuration of the system on which they are hosted. They cannot edit LDAP and/or HTTP imported records.                                                                                                                                                                                                                                                                                                                                   |
| <b>Date/Time Programmable Button</b>                          | Allows system phone users to manually set the system date and time through a programmable button (see <a href="#">System Date and Time</a> on page 787).                                                                                                                                                                                                                                                                                                                                                                                                              |
| The following options are only supported on IP500 V2 systems. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>System Management</b>                                      | Allows the user to invoke a system shutdown command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Memory Card Management</b>                                 | Allows the user to shutdown, startup memory cards and to perform actions to move files on and between memory cards.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>System Alarms</b>                                          | For certain events the system can display an <b>S</b> on the user's phone to indicate that there is a system alarm. The user can then view the full alarm text in the phone's Status menu. The possible alarms in order of priority from the highest first are: <ol style="list-style-type: none"> <li>1. Memory Card Failure.</li> <li>2. Expansion Failure.</li> <li>3. Voicemail Failure.</li> <li>4. Voicemail Full.</li> <li>5. Voicemail Almost Full.</li> <li>6. License Key Failure.</li> <li>7. System Boot Error.</li> <li>8. Corrupt Date/Time.</li> </ol> |

[Configure User Settings](#) on page 835

## The 'No User' User

It is possible to have an extension which has no default associated user. This can occur for a number of reasons:

- The extension has no **Base Extension** setting associating it with a user who has the same setting as their **Extension** to indicate that they are the extension's default associated user.
- The extension's default associated user has logged in at another extension. Typically they will be automatically logged back in at their normal extension when they log out the other phone.
- The extension's default associated user cannot be automatically logged in as they are set to **Forced Login**.

Phones with no current user logged in are associated with the setting of the **NoUser** user in the system configuration. This user cannot be deleted and their Name and Extension setting cannot be edited. However their other settings can be edited to configure what functions are available at extensions with no currently associated user.

By default the **NoUser** user has **Outgoing Call Bar** enabled so that the extension cannot be used for external calls. The users first programmable button is set to the **Login** action.

Avaya 1100 Series, 1200 Series, M-Series and T-Series phones, when logged out as **No User**, the phones are restricted to logging in and dial emergency calls only.

### NoUser Source Numbers

The **SourceNumbers** tab of the **NoUser** user is used to configure a number of special options. These are then applied to all users on the system. For details refer to the **User | Source Numbers** section.

## Suppressing the NoCallerId alarm

Use this procedure to suppress the NoCallerId alarm for all users on the system. Once the task is completed, the NoCallerID alarm is not raised in SysMonitor, SNMP traps, email notifications, SysLog or System Status.

### Procedure

1. In Manager, in the navigation pane on the left, select **User**.
2. In the list of users, select **NoUser**.
3. In the details pane, select the **Source Numbers** tab.
4. Click **Add**.
5. In the **Source Number** field, enter **SUPPRESS\_ALARM=1**.
6. Click **OK**.

# Chapter 83: Avaya cloud authorization

Using Avaya cloud authorization, you can configure the Avaya Workplace Client connection using your Avaya native cloud account, Google, Office 365, Salesforce account, or Enterprise Account (SSO).

You can configure the Avaya Workplace Client settings automatically using your email address or the automatic configuration web address.

Enabling Avaya cloud authorization automatically uses your network login and password to access different enterprise systems with a single sign-on. Using Avaya cloud authorization, you do not need to separately log in to each system or service in your organization.

For full details, refer to *IP Office SIP Telephone Installation Notes*.

## Note:

Avaya Cloud Account Authorization works only on TLS transport type.

[Apple push notification services](#) on page 853

---

## Apple push notification services

Apple Push Notification service (APNs) is a platform notification service created by Apple Inc. This service allows iOS users of Avaya Workplace Client for iOS to receive notification of new calls, voicemail messages, and other events. They receive these notifications regardless when the Avaya Workplace Client for iOS is idle in the background or is in quit state. However, if Avaya Workplace Client for iOS is on suspension, then Avaya Workplace Client for iOS automatically starts when a new call or instant message notification arrives.

- Apple Push Notification service (APNs) works only on TLS transport type.
- The iOS device sends notifications via an intermediate push notifications server provided by Avaya.
- IP Office supports push notification with Avaya Workplace Client for iOS R3.8 and later.
- On receiving a new call notification, and while Avaya Workplace Client for iOS is on suspension, it takes up to six seconds before the Avaya Workplace Client for iOS becomes active, and you can answer the call. The exact delay depends on the version of iOS and the device used. Therefore, the **No Answer Time** setting time is increased to more than

20 seconds to allow the calls to ring before going to voicemail or following the divert on no answer settings.

- APNs service supports only a single iOS device per user. If the you use Avaya Workplace Client for iOS on two devices, for example, an iPad and an iPhone, only the last client to register will receive notifications.
- While using iOS push notifications, always configure and enable voicemail or an alternate call destination number. When Avaya Workplace Client for iOS is not reachable, the **No Answer Time** setting triggers and the push notifications to a voicemail or a forward on no answer number.
- Setting your iOS device with a GSM telephone number as your mobile twinning, and setting the **Mobile Dial Delay** (sec) to more than 10 seconds, allows the time for the call notification to be answered on a previously suspended client before it alerts the GSM call.

 **Note:**

In IP Office, while using iOS push notifications, if you were using a secured port in the primary server, use the same secured port as a preferred port in secondary server. Any mismatch in the secured port configuration is not valid.

[Avaya cloud authorization](#) on page 853

[Enabling Apple push notifications](#) on page 854

## Enabling Apple push notifications

### About this task

Apple Push notifications for Avaya Workplace Client on iOS devices.

Use this procedure to enable the push notifications to allow the clients to receive call and voicemail message notifications.

 **Note:**

When Avaya Workplace Client in your iOS device, such as iPad or iPhone, is in suspended state or quit state and you log in to another Android or Windows based mobility or desktop device using the same user, IP Office deletes the associated application device token and unregisters your iOS device if registered. When you log in using the same user, you must manually logout and login to the the iOS device to reactivate the token so that you can receive push notification calls.

### Before you begin

- All IP Office's in Small Community Networking (SCN) should have egress public access to connect to Apple Push Notification Provider (APNP) to support push notification to Avaya Workplace Client.
- In the case of SCN deployments, IP Office primary server should synchronize the configured System ID, Private/Public key with all IP Office in SCN deployments.
- Configuration synchronize is supported only in IP Office Server Edition with a centralized primary server (only Star topologies ) and Managed/Hybrid Customer Premises Equipment

(CPE). It does not in case of Traditional SCN Deployments with 500v2 (includes serial, mesh and star topologies).

- In the case of Server Edition with centralized primary or Managed/Hybrid CPE, synchronizing Push details should be done through an explicit button that is available in Web-Manager at the solution level.
- Synchronizing Push details is dependent on the generation of System-ID (dependent on the configuration of Zang domain and APNS) and Public Key/Private Key. Enabling APNS at the solution level, synchronizes the push button.
- Web-Manager needs to synchronize the System-ID and Public/Private key pair in **System Security** settings generated in primary server of SCN nodes.
- To sync security settings, the administrator should have access to security settings of IP Office
- Adding a new expansion to the existing solution synchronizes the configuration to the expansion. But synchronization of the push details(security settings) should be done manually using the synchronization button in Web-Manager by Administrator.
- In the case of IP Office 500v2 systems in SCN or Server Edition without a centralized primary, ensure the company domain is configured and verified.

## Procedure

1. Select **System Settings > System > Avaya Push Notification Services**.
2. Select **Enable Apple Push Notification Services**.
3. Click **OK**.

### **Note:**

Increase the **No Answer Time** settings while using Avaya Workplace Client on iOS devices to at least 20 seconds. This can be done either by:

- Go to **System Settings > System > Telephony > Telephony** and increase the **Default No Answer Time** settings
- Select **Call Management > Users > Add > Telephony > Call Settings** and increase the **No Answer Time** setting of the individuals.

# Chapter 84: Managing Users with LDAP

Lightweight Directory Access Protocol (LDAP) is a software protocol for enabling anyone to locate organizations, individuals, and other resources such as files and devices in a network, whether on the internet or on a corporate intranet. IP Office supports LDAP version 2 and 3 compliant directory services servers.

LDAP synchronization allows an administrator to quickly configure the IP Office system with users and extensions for the users based on an organization's LDAP directory. An LDAP directory is organized in a simple tree consisting of the following hierarchy of levels:

1. The root directory (the starting place or the source of the tree)
2. Countries
3. Organizations
4. Organizational units (divisions, departments, etc.)
5. Individuals (which includes people, files, and shared resources, for example printers)

An LDAP directory can be distributed among many servers. Each server can have a replicated version of the total directory that is synchronized periodically. An LDAP server is called a Directory System Agent (DSA). An LDAP server that receives a request from a user takes responsibility for the request, passing it to other DSA's as necessary, but ensuring a single coordinated response for the user.

[Performing LDAP Synchronization](#) on page 856

[Creating a User Provisioning Rule for LDAP Synchronization](#) on page 857

---

## Performing LDAP Synchronization

### Procedure

1. In Web Manager, navigate to the page **Solution > Solution Settings > User Synchronization Using LDAP > Connect to Directory Service**.
2. Define the connection to the LDAP server and to define the parameters for searching the LDAP directory. All fields are mandatory.
3. Click **Test Connection**.

Web Manager attempts to connect to the LDAP server with the specified credentials.

4. Click **Synchronize User Fields**.
5. Map the IP Office user fields to the LDAP fields. Not all fields are mandatory.

 **Note:**

You must click **Test Connection** on the **Connect to Directory Service** page to populate the LDAP fields on the **Synchronize User Fields** page.

6. Click **Preview Results** and review the list in the Preview Results window.
7. Click **Synchronize**.

The User Synchronization window opens. Click the information icon to open a detailed report.

## Creating a User Provisioning Rule for LDAP Synchronization

A user provisioning rule (UPR) provides a way to manage the users to be imported. A UPR can provide the following properties for importing users.

- the IP Office system where the users are created
- starting extension
- extension template
- extension type
- user template

#### Procedure

1. In Web Manager, navigate to the page **Solution > Solution Settings > User Synchronization Using LDAP > Manage User Provisioning Rules**.
2. In the **User Provisioning Rule Name** field, enter a name for the rule.
3. Optional. Select an **IP Office Name** from the list.

If an IP Office system is selected, the users are created on this system.

4. Optional. Enter a **Start Extension**.

If a start extension is provided, users are assigned starting from this extension. If an extension number is in use, the extension number is skipped and the next available number is assigned.

 **Note:**

**Start Extension** is a mandatory field if a value is provided for **Extension Template** or **Extension Type**.

5. Optional. Select an **Extension Template** from the **Select Extension Template** list.  
The extension template is applied to all users imported with this UPR.
6. Optional. Select an **Extension Type** to define the extension type created for each user.  
If both **Select Extension Template** and **Extension Type** are selected, the **Extension Template** is used.
7. Optional. Select a **User Template** from the **Select User Template** list.  
The user template is applied to all users imported with this UPR.
8. In the LDAP directory, enter the name of the UPR created in IP Office in the User column.
9. In IP Office, navigate to the page **Solution > Solution Settings > User Synchronization Using LDAP > Synchronize User Fields**.
10. Map the IP Office fields defined in the user provisioning rule to **User Provisioning Rule**.

# Chapter 85: Message Waiting Indication

Message waiting indication (MWI) or a message lamp is supported for a wide variety of phones. It is used to provide the user with indication of when their voicemail mailbox contains new messages. It can also be configured to provide them with indication when selected hunt group mailboxes contain new messages.

Avaya digital and IP phones all have in-built message waiting lamps. Also for all phone users, the one-X Portal for IP Office application provides message waiting indication.

## Related links

[Message Waiting Indication for Analog Phones](#) on page 859

[Message Waiting Indication for Analog Trunks](#) on page 860

---

## Message Waiting Indication for Analog Phones

For analog phones, the system supports a variety of analog message waiting indication (MWI) methods. The method used for an individual analog extension is set for the **Extn | Analog | Message Waiting Lamp Indication Type** field. Those methods are

- **101V**
- **51V Stepped**
- **81V**
- **Bellcore FSK**
- **Line Reversal A**
- **Line Reversal B**
- **None**
- **On**

The 101V method is only supported when using a Phone V2 expansion module.

81V is typically used in European countries. 51V Stepped is used in most other countries. However the actual method used for a particular model of analog phone should be confirmed with the phone manufacturer's documentation.

The **Message Waiting Lamp Indication Type** field also provides options for **None** (no MWI operation) and **On**. **On** selects a default message waiting indication method based on the system locale.

| 'On' Method        | Locale                                                                                                                                                                         |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>81V</b>         | Belgium, Denmark, Finland, France, Germany, Greece, Hungary, Iceland, Italy, Netherlands, Norway, Poland, Portugal, Russia, Saudi Arabia, Sweden, Switzerland, United Kingdom. |
| <b>51V Stepped</b> | Argentina, Australia, Brazil, Canada, Chile, China, Colombia, Japan, Korea, Mexico, New Zealand, Peru, South Africa, Spain, United States.                                     |

For the United Kingdom system locale (eng), the default Caller Display Type (UK) allows updates of an analog phone's ICLID display whilst the phone is idle. The system uses this facilities to display the number of new messages and total number of messages in the users own mailbox. This feature is not supported with other Caller Display Types.

### Hunt Group Message Waiting Indication

By default no message waiting indication is provided for hunt group voicemail mailboxes. Message waiting indication can be configured by adding an **H** entry followed by the hunt groups name to the Source Numbers tab of the user requiring message waiting indication for that hunt group. For example, for the hunt group Sales, add **HSales**. Hunt group message waiting indication does not require the user to be a member of the hunt group.

[Message Waiting Indication](#) on page 859

---

## Message Waiting Indication for Analog Trunks

IP Office can provide a MWI for analog trunks from the PSTN network that terminate on an ATM4U-V2 card. Multiple users can be configured to receive a MWI from a single analog line. Users can receive an MWI from multiple lines. Configuring a user for MWI includes configuraton of a button for automatically dialing the message center.

Note the following conditions.

- Only supported for analog trunks terminating on the ATM4U-V2 card.
- When Analog Trunk MWI is selected as the Voicemail Type, no other voicemail system is active. As a result, hunt group queue announcements are not supported, since they require Embedded Voice Mail or Voicemail Pro.
- All analog trunks configured for MWI must use the same message center number. Multiple message centers are not supported.
- Not supported in One-X Portal.
- No TAPI is provided for analog trunk MWI status.
- Not supported across multiple IP Office systems. If the analog line is on a different node than the user's phone, that phone cannot receive an MWI for the line.
- Mobile twinning is not supported. Analog trunk MWI is displayed only on the master set.
- Internal twinning is not supported automatically. However, the twinned set can be configured to receive the same analog trunk MWI as the master set.

## Configuring MWI for an Analog Trunk

1. Go to **System | Voicemail**. In the **Voicemail** field, select **Analog Trunk MWI**.
2. In the **Destination** field, enter the message center telephone number.
3. Select the **Line** you want to configure for Analog MWI, and then select the **Analog Options** tab.
4. In the **MWI Standard** field, select **Bellcore FSK**.
5. Select the **User** you want to configure for MWI and then select the **Button Programming** tab.
6. Select the button you want to configure and then click **Edit**.
7. In the **Action** field click the browse (...) button and select **Advanced > Voicemail > Monitor Analog Trunk MWI**.
8. In the **Action Data** field, enter the line appearance ID of the analog line.

# Chapter 86: Configuring User Rights

For most settings in a user rights template, the adjacent drop down list is used to indicate whether the setting is part of the template or not. The drop down options are:

- **Apply User Rights Value** Apply the value set in the user rights template to all users associated with the template.
  - The matching user setting is grayed out and displays a  lock symbol.
  - Users attempting to change the settings using short codes receive inaccessible tone.
- **Not Part of User Rights** Ignore the user rights template setting.

## Default User Rights

For defaulted systems, the following user rights are created as a part of the default configuration. Fields not listed are not part of the user rights.

### \* Note:

When a user logs in as a Outbound Contact Express agent, the Outdialer user rights are automatically applied. When the agent logs out, the previous user rights are applied.

✓ = Set to On. ✗ = Set to Off. – = Not part of the user rights.

| User Rights              | IP Hard Phone | Mailbox | Paging | Outdialer |
|--------------------------|---------------|---------|--------|-----------|
| Priority                 | ✓ 5           | ✓ 5     | ✓ 5    | ✓ 5       |

# Chapter 87: DND, Follow Me and Forwarding

This section contains topics looking at how users can have their calls automatically redirected. As illustrated, there is an order of priority in which the redirect methods are used.

## Retrieving Externally Forwarded Calls:

Where a call is forwarded to an external destination and receives busy or is not answered within the forwarding user's **No Answer Time**, the system will attempt to retrieve the call. If forwarded on a trunk that does not indicate its state the call is assumed to have been answered, for example analog loop start trunks.

**Off-Switch Forwarding Restrictions:**

User forwarding is subject to the same restrictions as transferring calls. To bar a user from forwarding calls to an external number, the **Inhibit Off-Switch Forward/Transfers (User | Telephony | Supervisor Settings)** option. To bar all users from forwarding calls to external numbers the Inhibit **Off-Switch Forward/Transfers** option can be used.

When transferring a call to another extension that has forwarding enabled, the type of call being transferred is used. For example, if transferring an external call, if the transfer target has forwarding of external calls enabled then the forward is used.

**Block Forwarding:**

The Block Forwarding setting is used for enforcing predictable call routing, where the call should always go to the same destination. This setting was implemented for contact center applications.

Block Forwarding can be set for a user on the **User | Forwarding** page or as a user rights setting on the **User Rights | Forwarding** page.

## Do Not Disturb (DND)

**Summary:** Redirect all calls to busy tone or to voicemail if available except those in your DND exceptions list.

Do Not Disturb (DND) is intended for use when the user is present but for some reason does not want to be interrupted. Instead calls are sent to voicemail if available, otherwise they receive busy tone.

- **Exceptions** Specific numbers can be added to the user's Do Not Disturb Exception List. Calls from those numbers override DND. N and X wildcards can be used at the end of exception numbers to match a range of numbers. For external numbers, this uses the incoming caller line ID (ICLID) received with the call.
- **Priority** Enabling DND overrides any Follow Me or forwarding set for the user, except for calls in the user's Do Not Disturb Exception List.
- **Phone** When enabled, the phone can still be used to make calls. An **N** is displayed on many Avaya phones. When a user has do not disturb in use, their normal extension will give alternate dialtone when off hook.

**Applied to**

| Call Types Blocked |   | Call Treatment                                    |
|--------------------|---|---------------------------------------------------|

| Park Return        | ✗ | Rings.                                            |
| Twinning           | ✓ | Voicemail if available, otherwise busy tone.      |

### Do Not Disturb and Twinning

- **Mobile Twinning** Selecting DND disables mobile twinning.
- **Internal Twinning**
  - Logging out or setting do not disturb at the primary stops twinned calls alerting at the secondary also.
  - Logging out or setting do not disturb at the secondary only affects the secondary.
- **Do Not Disturb Exceptions List** For both types of twinning, when DND is selected, calls from numbers entered in the user's Do Not Disturb Exception List are presented to both the primary and secondary phones.

### Do Not Disturb Controls

| Do Not Disturb     |                                                                                                                                                                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

[DND, Follow Me and Forwarding](#) on page 866

## Follow Me

**Summary:** Have your calls redirected to another user's extension, but use your coverage, forwarding and voicemail settings if the call receives busy tone or is not answered.

Follow Me is intended for use when a user is present to answer calls but for some reason is working at another extension such as temporarily sitting at a colleague's desk or in another office or meeting room. Typically you would use Follow Me if you don't have a Hot Desking log in code or if you don't want to interrupt your colleague from also receiving their own calls, ie. multiple users at one phone.

- **Priority**

Follow Me is overridden by DND except for callers in the user's DND Exception Numbers List. Follow Me overrides Forward Unconditional but can be followed by the user's Forward on Busy or Forward on No Answer based on the status of the Follow Me destination.

- **Destination**

The destination must be an internal user extension number. It cannot be a hunt group extension number or an external number.

- **Duration**

The Follow Me user's no answer timeout is used. If this expires, the call either follows their Forward on No Answer setting if applicable, or goes to voicemail if available. Otherwise the call continues to ring at the destination.

- **Phone**

When enabled, the phone can still be used to make calls. When a user has follow me in use, their normal extension will give alternate dial tone when off hook.

- **Exceptions**

- The Follow Me destination extension can make and transfer calls to the follow me source.

- The call coverage settings of the user are applied to their Follow Me calls. The call coverage settings of the destination are not applied to Follow Me calls it receives.

| Call Types Redirected |   |                 |
|-----------------------|---|-----------------|
| Internal              | ✓ | Redirected.     |

[DND, Follow Me and Forwarding](#) on page 866

# Forward Unconditional

**Summary:** Have your calls redirected immediately to another number including any external number that you can dial.

- **Priority**

This function is overridden by DND and or Follow Me if applied. **Forward Unconditional** overrides **Forward on Busy**.

- **Destination**

The destination can be any number that the user can dial. If external and Inhibit Off-Switch Transfers is applied, the caller is directed to voicemail if available, otherwise they receive busy tone. If the destination is an internal user on the same system, they are able to transfer calls back to the user, overriding the Forward Unconditional.

- **Duration**

After being forwarded for the user's no answer time, if still unanswered, the system can apply additional options. It does this if the user has forward on no answer set for the call type or if the user has voicemail enabled.

- If the user has forward on no answer set for the call type, the call is recalled and then forwarded to the forward on no answer destination.
- If the user has voicemail enabled, the call is redirected to voicemail.
- If the user has both options set, the call is recalled and then forwarded to the forward on no answer destination for their no answer time and then if still unanswered, redirected to voicemail.
- If the user has neither option set, the call remains redirected by the forward unconditional settings.

Note that for calls redirected via external trunks, detecting if the call is still unanswered requires call progress indication. For example, analog lines do not provide call progress signalling and therefore calls forwarded via an analog lines are treated as answered and not recalled.

- **Phone**

When enabled, the phone can still be used to make calls. An **D** is displayed on DS phones. When a user has forward unconditional in use, their normal extension will give alternate dialtone when off hook.

- **Calls Forwarded**

Once a call has been forwarded to an internal destination, it will ignore any further **Forward No Answer** or **Forward on Busy** settings of the destination but may follow additional **Forward Unconditional** settings unless that creates a loop.

| Call Types Forwarded |   |           |

| VM Ringback          | ✗ | Rings.           |
| Automatic Callback   | ✗ | Rings.           |
| Transfer Return      | ✗ | Rings.           |
| Hold Return          | ✗ | Ring/hold cycle. |
| Park Return          | ✗ | Rings.           |

\*Optional only for calls targeting sequential and rotary type groups. Includes internal call to a hunt group regardless of the forward internal setting.

- **To Voicemail:** Default = Off.

If selected and forward unconditional is enabled, calls are forwarded to the user's voicemail mailbox. The **Forward Number** and **Forward Hunt Group Calls** settings are not used. This option is not available if the system's **Voicemail Type** is set to **None**. 1400, 1600, 9400, 9500, and 9600 Series phone users can select this setting through the phone menu. Note that if the user disables forward unconditional the **To Voicemail** setting is cleared.

#### Forward Unconditional Controls

| Forward Unconditional Controls |                                                                                                                                                                                                                                                                                                                                              |

## Forward on Busy

**Summary:** Have your calls redirected when you are busy to another number including any external number that you can dial.

The method by which the system determines if a user is 'busy' to calls depends on factors such as whether they have multiple calls appearance buttons or Call Waiting and or Busy on Held set. See Busy.

- **Priority**

This function is overridden by DND and or Forward Unconditional if applied. It can be applied after a Follow Me attempt. It overrides Forward on No Answer.

- **Destination**

The destination can be any number that the user can dial. The Forward Unconditional destination number is used unless a separate number Forward on Busy Number is set. If Inhibit Off-Switch Transfers is applied, the caller is directed to voicemail if available, otherwise they receive busy tone.

- **Duration**

The destination is rung using the forwarding user's No Answer Time. If this expires, the call goes to voicemail if available. Calls to an external destination sent on trunks that do not signal their state are assumed to have been answered, for example analog loop start trunks.

- **Phone**

Forward on Busy is not indicated and normal dial tone is used.

- **Calls Forwarded**

Once a call has been forwarded to an internal destination, it will ignore any further **Forward No Answer** or **Forward on Busy** settings but may follow additional **Forward Unconditional** settings.

| Call Types Forwarded |   |                  |
|----------------------|---|------------------|
| Internal             | ✓ | Optional.        |
| External             | ✓ | Forwarded.       |
| Hunt Group           | ✗ | Not presented.   |
| Page                 | ✗ | Not presented.   |

## Forward on No Answer

**Summary:** Have your calls redirected another number if it rings without being answered.

- **Priority**

This function is overridden by DND and Forward on Busy if applied. It can be applied after a Follow Me attempt. Forward Unconditional overrides Forward on Busy and Forward on No Answer.

- **Destination**

The destination can be any number that the user can dial. The Forward Unconditional destination number is used unless a separate number Forward on Busy Number is set. If Inhibit Off-Switch Transfers is applied, the caller is directed to voicemail if available, otherwise they receive busy tone.

- **Duration**

The destination is rung using the forwarding user's No Answer Time. If this expires, the call goes to voicemail if available. Otherwise the call continues to ring at the destination. Calls to an external destination sent on trunks that do not signal their state are assumed to have been answered, for example analog loop start trunks.

- **Phone**

Forward on No Answer is not indicated and normal dial tone is used.

- **Calls Forwarded**

Once a call has been forwarded to an internal destination, it will ignore any further **Forward No Answer** or **Forward on Busy** settings but may follow additional **Forward Unconditional** settings.

| Call Types Forwarded |   |                 |
|----------------------|---|-----------------|
| Internal             | ✓ | Optional.       |
| External             | ✓ | Forwarded.      |
| Hunt Group           | ✗ | Not applicable. |

## Determining a User's Busy Status

Various system features allow users to handle more than one call at a time. Therefore the term "busy" has different meanings. To other users it means whether the user is indicated as being busy. To the system it means whether the user is not able to receive any further calls. The latter is used to trigger 'busy treatment', either using a user's **Forward on Busy** settings or redirecting calls to voicemail or just returning busy tone.

- **Busy Indication - In Use**

The user busy indication provided to programmable buttons and to user applications, is based on the monitored user's hook switch status. Whenever the user is off-hook, they will be indicated as being busy regardless of call waiting or call appearance settings.

- **Busy to Further Calls**

Whether a user can receive further calls is based on a number of factors as described below.

- **Logged In and Present**

Is the user logged into an extension and is that extension physically connected to the system.

- **Busy on Held**

If a user enables their Busy on Held setting, whenever they have a call on hold, they are no longer available to any further incoming calls.

- **Appearance Buttons**

A user's call appearance button are used to receive incoming calls. Normally, whilst the user has any free call appearance buttons, they are available to receive further calls. Exceptions are:

- **Reserve Last Appearance**

Users with appearance buttons require a free call appearance button to initiate transfers or conferences. Therefore it is possible through the user's configuration settings to reserve their last call appearance button for outgoing calls only.

- **Other Appearance Buttons**

Calls may also be indicated on line, call coverage and bridged appearance buttons.

- **Call Waiting**

Users of phones without appearance buttons can use call waiting. This adds an audio tone, based on the system locale, when an additional call is waiting to be answered. Only one waiting call is supported, any further calls receive busy treatment.

- **Hunt Group Calls**

A user's availability to receive hunt group calls is subject to a range of other factors. See Member Availability.

[DND, Follow Me and Forwarding](#) on page 866

## Chaining

Chaining is the process where a call forward to an internal user destination is further forwarded by that user's own forwarding settings.

- **Follow Me Calls**

Follow Me calls are not chained. They ignore the forwarding, Follow Me and Do Not Disturb settings of the Follow Me destination.

- **Voicemail**

If the call goes to voicemail, the mailbox of the initial call destination before forwarding is used.

- **Looping**

When a loop would be created by a forwarding chain, the last forward is not applied. For example the following are scenarios where A forwards to B, B forwards to C and C forwards to A. In each case the final forward is not used as the destination is already in the forwarding chain.

- **Hunt Group Loop**

If a user forwards a call to a hunt group of which they are a member, the group call is not presented to them but is presented to other members of the hunt group.

- **Maximum Number of Forwards**

A maximum of 10 forwarding hops are supported for any call.

- **Calls Forwarded**

Once a call has been forwarded to an internal destination, it will ignore any further **Forward No Answer** or **Forward on Busy** settings but may follow additional **Forward Unconditional** settings.

# Chapter 88: Hot Desking

Hot desking allows users to log in at another phone. Their incoming calls are rerouted to that phone and their user settings are applied to that phone. There are a number of setting and features which affect logging in and out of system phones.

To hot desk, a user must be assigned a **Login Code** (**User > Telephony > Supervisor Settings**) in the system configuration.

By default, each system extension has an **Base Extension** setting. This associates the extension with the user who has the matching **Extension** settings as being that extension's default associated user.

- By leaving the **Base Extension** setting for an extension blank, it is possible to have an extension with no default associated user. This is only supported for non-IP/CTI extensions. Extensions in this state use the settings of a special user named **NoUser**. On suitable phones the display may show **NoUser**.
- You can create users whose Extension directory number is not associated with any physical extension. These users must have a log in code in order to log in at a phone when they need to make or receive calls. In this way the system can support more users than it has physical extensions.
- Remote extensions must have an associated default user who is logged in. That user's user profile establishes the extension's right to operate as a remote extension. Any other user logging in over the default user must also have a user profile that allows remote extension usage.

## Hot Desking Operation

When another user logs in at an extension, they control that phone. Any existing user, including the default associated user, is logged out of that phone.

- Any user settings not applicable to the type of phone on which the user has logged in become inaccessible. For example some programmable button features will become inaccessible if the phone at which a user logs in does not have a sufficient programmable buttons.
- 1400, 1600, 9400, 9500, 9600, and J100 Series telephones all use the centralized call log and centralized personal directory features that move those settings with the user as they hot desk.
- Other Avaya H.323 IP telephones can be configured to backup and restore user settings to a file server when a user hot desks between phones. The range of settings supported depends on the particular phone model. Refer to the *Avaya IP Office™ Platform H.323 Telephone Installation* manual.
- For all other features and phone types, it must be assumed that any settings and data shown by the phone is stored by the phone and are still accessible after logging off.
- By default the IP Office system blocks J129 and H175 phones from being used for hot-desking. If required, the NoUser source number `SIP_ENABLE_HOT_DESK` enables hot-desking support for those phones.
- Hot-desking is not supported for SIP softphone applications. That includes clients running on Avaya Vantage™ telephones.

## Logging Out

When a user logs out or is logged out by someone else logging in, they are automatically logged back in at the extension for which they are the default associated user if no one else is logged in at that extension. However this does not happen for users set to **Forced Login (User > Telephony > Supervisor Settings)**.

- For each user, you can configure how long the extension at which they are logged in can remain idle before they are automatically logged out. This is done using the Login Idle Period option. This option should only be used in conjunction with Force Login.
- Logged in users who are members of a hunt group can be automatically logged out if they do not answer hunt group calls presented to them. This is done by selecting **Logged Off** as the user's **Status on No Answer (User > Telephony > Supervisor Settings)** setting.
- Calls to a logged out user are treated as if the user is busy until the user logs in.

# Hot Desking Controls

Logging in and out at a phone can be done either using system short codes or programmable buttons.

- The default system short code for logging in, is **\*35\*N#** where the user replaces N with their extension number and log in code separated by a \*. This uses the short code feature **ExtnLogin**. If the user dials just a log in code as N, it is checked against the user with the same extension number as the extension's base extension number.
- The default system short code for logging out is **\*36**. This uses the short code feature **ExtLogout**.
- The **ExtnLogin** and **ExtnLogout** features can be assigned to programmable buttons on suitable Avaya phones. The **ExtnLogin** button prompts the user to enter their details.

# Hot Desking in an IP Office Network

Hot desking can be used in a network of IP Office systems.

- The IP Office system on which the user is configured is termed their 'home' system
- All other IP Office systems are 'remote' systems.

The following additional features are supported for hot-desking with a network of IP Office systems.

## Hot Desking onto another IP Office System

The system supports hot desking between systems within a network of IP Office systems. In the descriptions below:

When a user logs in to a remote system:

- The user's incoming calls are automatically rerouted to the remote IP Office system.
- The user's outgoing calls uses the settings of the remote IP Office system.
- The user's license privileges move with them. For example, their user profile setting is retained with the remote IP Office needing licenses for that profile type.

- The user's own settings are transferred. However, some settings may become unusable or may operate differently:
  - User rights are not transferred to the remote system but the name of any user rights associated with the user are transferred. If user rights with the same name exist on the remote system, then they are used. The same applies for user rights applied by time profiles, if time profiles with the same name exist on the remote system .
  - Appearance buttons configured for users on the home system will no longer operate.
  - Various other settings may either no longer work or may work differently depending on the configuration of the remote system at which the user has logged in.

If the user's home system is disconnected from the network while the user is remotely hot desked, the user remains remotely hot desked. They can remain in that state unless the remote system is restarted. Note however, when the user's home system is reconnected, the user may be automatically logged back onto that system.

### Dialing from another IP Office System (Break Out)

In some scenarios a hot desking user logged in at a remote system will want to dial a number using the system short codes of another system, typically their home system. This can be done using either short codes with the **Break Out** feature or a programmable button set to **Break Out**. This feature can be used by any user within the multi-site network but is of most use to remote hot desked users.
