On systems with a call center application such as Compact Contact Center (CCC) or Compact Business Center (CBC), logging in and logging out is a key part of tracking and reporting on call center agents. It also controls call distribution as, until the agent logs in, their hunt group membership is seen as disabled.

For CCC, CBC and Delta Server, an agent is defined as being a user with a Login Code and set to Forced Login. Those users consume a CCC agent license.

---

## Hot Desking Examples

The following are example of different ways that the hot desking settings can be used.

#### Related links

[Hot Desking](#) on page 880

## Scenario 1: Occasional Hot Desking

### About this task

In this scenario, a particular user, for this example extension 204, needs to occasionally work at other locations within the building.

### Procedure

1. A **Login Code** is added to the user's configuration settings, for this example **1234**.
2. The user can now log in when needed at any other phone by dialing **\*35\*204\*1234#**.

The phone's default associated user is logged out by this and their calls get busy treatment. User 204 is also logged out their normal phone and their calls now rerouted to the phone at which they have logged in.

3. When finished, the user can dial **\*36** to log out.
4. This logs the phone's normal default user back on.

Its also logs the hot desking user back on at their normal extension.

## Scenario 2: Regular Hot Desking

### About this task

This scenario is very similar to the one above. However, the user doesn't want to be automatically logged back in on their normal phone until they return to its location.

### Procedure

1. A **Login Code** is added to the user's configuration settings, for this example **1234**.
2. The Forced Login option is selected.
3. When the user logs out of the phone that they are currently using, they are no longer automatically logged in on their normal extension.

When they return to it they must dial **\*35\*204\*1234#** to log in.

4. Whilst not logged in anywhere, calls to the user receive busy treatment.

## Scenario 3: Full Hot Desking

### About this task

Similar to the scenarios above but this time the user doesn't have a regular phone extension that they use. In order to make and receive calls they must find a phone at which they can log in.

### Procedure

1. The user is given an Extension directory number that is not matched by the extension directory number setting of any existing extension.

2. They are also given a **Login Code** and a **Login Idle Period** is set, for this example 3600 seconds (an hour). **Forced Login** isn't required as the user has no default extension at which they might be automatically logged in by the system.
3. The user can now log in at any available phone when needed.
4. If at the end of the business day they forget to log out, the Login Idle Period will eventually log them off automatically.

## Scenario 4: Call Center Hot Desking

### About this task

In this scenario, the phone extensions have no default extension number. Several phones set like this might be used in a call center where the agents use whichever desk is available at the start of their shift. Alternatively a set of desks with such phones might be provided for staff that are normally on the road but occasionally return to the office and need a temporary desk area to complete paper work.

### Procedure

1. For the extensions, the Extension setting is left blank.  
This means that those phones will be associated with the NoUser user's settings and display **NOT LOGGED ON**.
2. The call center agents or road-warrior users are configured with Extension directory numbers that also don't match any existing physical extensions.  
They are all given Login Code numbers.
3. The users can log in at any of the extensions when required.  
When they log out or log in elsewhere, the extensions return to the NoUser setting.

---

## Automatic Log Out

Normally a user can either log themselves out or be logged out by another user logging in. The following methods can be used by the system to automatically log out a user, so long as that user has a **Login Code** and is set to **Forced Login**.

Note: A remote hot desking user whose home system can no longer be seen by the remote system at which they are logged in is automatically logged out after 24 hours.

### Idle Timeout:

The user **Login Idle Period (User | Telephony | Supervisor Settings)** can be used to automatically log out the user after a set period of phone inactivity. The period can be set between 1 to 99999 seconds and is based on call inactivity other than ringing calls.

### Unanswered Calls:

Users who are members of hunt groups are presented with hunt group calls when they are logged in and not already on a call. If the user is logged in but not actually present they will continue to be presented with hunt group calls. In this scenario it can be useful to log the user off.

- **For the hunt group** On the **Hunt Group | Hunt Group** tab, use the **Agent's Status on No Answer Applies to** setting to select which types of unanswered hunt group calls should change the user's status. The options are:
  - **None**
  - **Any Calls**
  - **External Inbound Calls Only**
- **For the user** The **Status on No Answer** setting (**User | Telephony | Supervisor Settings**) can be used. This sets what the user's status should be changed to if they do not answer a hunt group call. The options are:
  - **Logged In** If this option is selected, the user's status is not changed.
  - **Busy Wrap-Up** If this option is selected, the user's membership status of the hunt group triggering the action is changed to disabled. The user can still make and receive calls and will still continue to receive calls from other hunt groups to which they belong.
  - **Busy Not Available** If this option is selected, the user's status is changed to do not disturb. This is the equivalent of DND and will affect all calls to the user.
  - **Logged Off** If this option is selected, the user's status is changed to logged out. In that state the cannot make calls and cannot receive calls. Hunt group calls go to the next available agent and personal calls treat the user as being busy.

# Chapter 89: Group Operation

A group is a collection of users accessible through a single directory number. Calls to that group can be answered by any available member of the group. The order in which calls are presented can be adjusted by selecting different group types and adjusting the order in which group members are listed.

- **Call Presentation:** The order in which the available members of the group are used for call

presentation is selectable.

- **Availability:** There are a range of factors which control whether group calls are presented to a user in addition to that user being a member of the group.
- **Queuing:** This optional feature allows calls to be queued when the number of calls to be presented exceeds the number of available group members to which call can be presented.
- **Announcements:** On systems with a voicemail server (Voicemail Pro or Embedded Voicemail), announcements can be played to callers waiting to be answered. That includes calls that are ringing and calls that are queued.
- **Overflow:** This optional feature can be used to include additional agents from an overflow group or groups when a call is not answered.
- **Fallback:** A group can be taken out of operation manually or using a time profile. During fallback, calls can be redirected to a fallback group or sent to voicemail or just receive busy tone. Two types of fallback are supported; night service and out of service.
- **Voicemail:** Calls can be redirected to voicemail. The system allows selection of whether group calls remain in the group mailbox or are copied (broadcast) to the individual mailboxes of the group members. When messages are stored in the group's own mailbox, selection of who receives message waiting indication is possible.

## Group Editing

Changing the name of a group has the following effects:

- A new empty mailbox is created on voicemail with the new group name.
- Records in other groups' Overflow lists will be updated.
- Out-of-Service and Night-Service fallback references are updated.

Modifying the extension number of a group updates the following:

- Group buttons.
- Overflow, Out of Service Fallback and Night Service Fallback group records.
- Incoming call route records.

When a group is deleted, all references to the deleted group will be removed including:

- Records in Incoming call routing tables.
- Transfer target in internal auto-attendant.
- Overflow, Night-Service or Fallback-Service on other groups.
- DSS keys monitoring group status.

## Server Edition Group Management

Groups can be stored in the configuration of any system in the network. Groups created at the solution level on Manager and Web Manager are stored on the Primary Server. All groups can include users from anywhere in the network and are automatically advertised to and diallable on any of the systems in the network.

Groups configured on the Server Edition Primary by default fail over to the Server Edition Secondary. Groups configured on a Server Edition Expansion System can be configured to fail over to the Server Edition Primary, the Server Edition Secondary, or another Server Edition Expansion System.

## Groups in a Multi-Site Network

In a multi-site network, the extension numbers of users are automatically shared between systems and become diallable from other systems without any further programming.

The following features are available for groups.

### Advertised Groups:

Each group can be set as being 'advertised'. The group can then be dialed from other systems within the multi-site network. The groups extension number and name must be unique within the network. Non-advertised group numbers remain local only to system hosting the group.

### Distributed Groups:

Groups on a system can include users located on other systems within the network. Distributed groups are automatically advertised to other systems within the network. Note that distributed groups can only be edited on the system on which they were created.

## Group Types

At its most basic, a group's settings consist of a group name, an extension number, a list of group members and a hunt type selection. It is the last two settings which determine the order in which incoming calls are presented to hunt group members.

The available group types are; Collective, Sequential, Rotary and Longest Waiting. These work as follows:

### Collective Group

An incoming call is presented simultaneously to all the available group members.

## Sequential Group

An incoming call is presented to the first available member in the list. If unanswered, it is presented to the next available member in the list.

The next incoming call uses the same order. It is presented to the available members starting again from the top of the list.

## Rotary Hunt Type

This hunt type operates similarly to Sequential. However the starting point for call presentation is the first available member after the last member to answer a call.

## Longest Waiting Hunt Type

Where hunt group calls are being presented to a twinned extension, the longest waiting status of the user can be reset by calls answered at either their master or twinned extension.

An incoming call is first presented to the available member who has been idle the longest. If unanswered it is presented to the next longest idle member.

This hunt type does not present calls to hunt group members in the order that they are listed. It presents calls using the order of how long the available hunt group members have been idle.

---

## Call Presentation

**Summary:** Calls are presented to each available hunt group member in turn. If having been presented to all the available members, none answers, the call is redirected to voicemail if available, otherwise it continues to be presented to the next available member.

In addition to the summary, options exist to have calls queued or to have calls also presented to agents in an overflow group or groups.

- **First and Next Available Members**

The first available member to which a call is presented and the order of the next available members to which a call is presented are determined by the hunt group's Hunt Type setting.

- **Additional Calls**

When additional calls are waiting to be presented, additional available hunt group members are alerted using the hunt group type. When any member answers a call it will be the first waiting call that is answered.

- **No Available Members**

If the number of incoming calls exceeds the number of available members to which calls can be presented, the following actions are usable in order of precedence.

- **Queuing**

If queuing has been enabled for the hunt, it is applied to the excess calls up to the limits specified for the number of queued calls or length of time queued.

- **Voicemail**

If voicemail has been enabled for the hunt group, excess calls are directed to voicemail.

- **Busy Tone**

Busy tone is returned to the excess calls (except analog and T1 CAS calls which remain queued).

- **No Answer Time**

This value is used to determine how long a call should ring at a hunt group member before being presented to the next available hunt group member. The **System | Telephony | Telephony | No Answer Time** setting is used unless a specific **Hunt | Hunt Group | No Answer Time** is set.

- **Voicemail**

If voicemail is being used, if having been presented to all the available group members the call is still not answered then it goes to voicemail.

- The call will also go to voicemail when the hunt group's **Voicemail Answer Time** is exceeded. the mailbox of the originally targeted hunt group is used even if the call has overflowed or gone to a night server hunt group.

- **Calls Not Being Answered Quick Enough - Overflow**

In addition to ringing at each available member for the No Answer Time, a separate **Overflow Time** can be set. When a call's total ring time against the group exceeds this, the call can be redirected to an overflow group or groups.

- **No Available Member Answers**

If a call has been presented unanswered to all the available members, either of two actions can be applied. If voicemail is available, the call is redirected to voicemail. If otherwise, the

call will continue being presented to hunt group members until answered or, if set, overflow is used.

- **Call Waiting**

For hunt groups using the Group hunt type, call waiting can be used.

---

## Group Member Availability

**Summary:** Details when a hunt group member is seen as being available to be presented a hunt group call.

The Hunt Group settings within Manager list those users who are members of the hunt group and therefore may receive calls directed to that hunt group. However there are a range of factors that can affect whether a particular hunt group member is available to take hunt group calls at any time.

- **Existing Connected Call**

Users with an existing connected call are not available to further hunt group calls. This is regardless of the type of connected call, whether the user has available call appearance buttons or is using call waiting.

- **Hunt Group Call Waiting**

For Collective hunt groups call waiting can be enabled using the **Ring Type** of **Collective Call Waiting**.

- **Logged In/Logged Out**

The system allows user's to log in and out extensions, a process known as 'hot desking'. Whilst a user is logged out they are not available to receive hunt group calls.

- Mobile Twinning users with both **Hunt group calls eligible for mobile twinning** and **Twin when logged out** selected will still receive hunt group calls unless they switch off twinning.

- **Membership Enabled/Disabled**

The system provides controls to temporarily disable a users' membership of a hunt group. Whilst disabled, the user is not available to receive calls directed to that hunt group.

- **Do Not Disturb**

This function is used by users to indicate that they do not want to receive any calls. This includes hunt group calls. In call center environments this state is also known as 'Busy Not Available'. See Do Not Disturb.

- **Busy on Held**

When a user has a held call, they can receive other calls including hunt group calls. The Busy on Held settings can be used to indicate that the user is not available to further calls when they have a held call.

- **Forward Unconditional**

Users set to Forward Unconditional are by default not available to hunt group calls. The system allows the forwarding of hunt group calls to be selected as an option.

- **Idle /Off Hook**

The hunt group member must be idle in order to receive hunt group call ringing.

- **No Available Members**

If queuing has been enabled, calls will be queued. If queuing has not been enabled, calls will go to the overflow group if set, even if the overflow time is not set or is set to 0. If queuing is not enabled and no overflow is set, calls will go to voicemail. If voicemail is not available, external calls go to the incoming call routes fallback destination while internal calls receive busy indication.

| Hunt Group Member Availability Settings |                                                                                                                                                                                                                                                                                              |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Manager</b>                          | Forwarding and do not disturb controls for a user are found on the User   Forwarding and User   DND tabs.<br><br>Enabling and disabling a users hunt group membership is done by ticking or unticking the user entry in the hunt group's extensions list on the Hunt Group   Hunt Group tab. |
| <b>Controls</b>                         | The following short code features/button programming actions can be used:                                                                                                                                                                                                                    |
| <b>SoftConsole</b>                      | A SoftConsole user can view and edit a user's settings. Through the directory, select the required user. # Example Hunt Group

The follow are simple examples of how a department might use the facilities of a hunt group.

## 1. Basic Hunt Group

The Sales department want all sales related calls to be presented first to Jane, then Peter and finally Anne.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Actions</b> | <ol style="list-style-type: none"> <li>1. Create a hunt group named Sales and assign it an extension number.</li> <li>2. Set the <b>Hunt Type</b> to <b>Sequential</b>.</li> <li>3. Add Jane, Peter and Ann to the <b>User L</b> ist in that order.</li> <li>4. Turn off queuing on the Queuing tab and voicemail on the Voicemail tab.</li> <li>5. Route relevant calls to the Sales group by selecting it as the destination in the appropriate Incoming Call Routes.</li> </ol> |
| <b>Results</b> | Any call received by the Sales hunt group is first presented to Jane if she is available. If Jane is not available or does not answer within 15 seconds the call is presented to Peter. If Peter is not available or does not answer within 15 seconds the call goes Anne. Since voicemail is not on, the call will continue to be presented around the group members in that order until it is answered or the callers hangs up.                                                  |

## 2. Adding Voicemail Support

A voicemail server has now been added to the system. The Sales department wants to use it to take messages from unanswered callers. When messages are left, they want Jane to receive message waiting indication.

|                |                                                                                                                                                                                                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Actions</b> | <ol style="list-style-type: none"> <li>1. Open the Sales hunt group settings and select <b>Voicemail On</b> on the Voicemail tab.</li> <li>2. Select the User settings for Jane. On the <b>Source Numbers</b> tab, add the entry <b>HSales</b>.</li> </ol>                                |
| <b>Results</b> | Once a call to the Sales group has been presented to all the available members, if it is still unanswered then the call will be redirected to the group's voicemail mailbox to leave a message. When a message has been left, the message waiting indication lamp on Jane's phone is lit. |

## 3. Using the Queuing Facility

The Sales department now wants calls queued when no one is available to answer. However if the number of queued calls exceeds 3 they then want any further callers directed to voicemail.

|                |                                                                                                                                                                                                                                                                    |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Actions</b> | <ol style="list-style-type: none"> <li>1. Open the Sales hunt group settings and select <b>Queuing On</b> on the <b>Queuing</b> tab.</li> <li>2. Set the <b>Queue Limit</b> to <b>3</b>.</li> </ol>                                                                |
| <b>Results</b> | When the Sales group are all on calls or ringing, any further calls to the group are queued and receive queuing announcements from the voicemail server. When the number of queued calls exceeds 3, any further calls are routed to the group's voicemail mailbox. |

#### 4. Using Out of Service Fallback

During team meetings, the Sales department want their calls redirected to another group, for this example Support.

|                |                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Actions</b> | <ol style="list-style-type: none"> <li>1. Open the Sales hunt group settings and select the <b>Fallback</b> tab. In the <b>Out of Service Fallback Group</b> field select the <b>Support</b> group.</li> <li>2. Create a system short code <b>*88/Set Hunt Group Out of Service/300</b>.</li> <li>3. Create a system short code <b>*89/Clear Hunt Group Out of Service/300</b>.</li> </ol> |
| <b>Results</b> | Prior to team meetings, dialing *88 puts the Sales group into out of service mode. Its calls are then redirected to the Support group. Following the meeting, dialing *89 puts the Sales group back In Service.                                                                                                                                                                            |

#### 5. Using a Night Service Time Profile

Outside their normal business hours, the Sales department want their group calls automatically sent to voicemail. This can be done using a time profile and leaving the Night Service Fallback Group setting blank.

|                |                                                                                                                                                                                                                                                                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Actions</b> | <ol style="list-style-type: none"> <li>1. Create a Time Profile called <b>Sales Hours</b> and in it enter the times during which the Sales department are normally available.</li> <li>2. Open the Sales hunt group settings and select the <b>Fallback</b> tab.</li> <li>3. In the <b>Time Profile</b> field select <b>Sales Hours</b>.</li> </ol> |
| <b>Results</b> | Outside the normal business hours set in the time profile, the Sales hunt group is automatically put into Night Service mode. Since no Night Service Fallback Group has been set, calls are redirected to voicemail.                                                                                                                                |

## CBC/CCC Agents and Hunt Groups

The use of and reporting on hunt groups is a key feature of call center operation. For IP Office, reporting is provided through the Compact Business Center (CBC) or Compact Contact Center (CCC) applications.

In order for these applications to provide hunt group and hunt group user (agent) reports, the following rules apply:

- The hunt group names must be restricted to a maximum of 12 characters.
- The hunt group and user extension numbers should be a maximum of 4 digits.
- Hunt group members should be given a Login Code and set to Force Login.
- The agent state Busy Not Available is equivalent to Do Not Disturb. The agent state Busy Wrap Up is equivalent to hunt group disable.

**Related links**

[Group Operation](#) on page 887

---

## Coverage Groups

For users with a **Coverage Group** selected, coverage group operation is applied to all external calls that are targeted to the user.

For external calls:

In scenarios where an external call would normally have gone to voicemail, it instead continues ringing and also starts alerting the members of the coverage group.

- The follow me settings of Coverage Group members are used, the forwarding settings are not.
- If the user is not available, for example if they have logged off or set to do not disturb, coverage group operation is applied immediately.
- If the user is configured for call forward on busy, coverage operation is applied to the user's calls forwarded to the forward on busy destination.

Coverage group operation is not applied to the following types of call:

- Hunt group calls.
- Recall calls such as transfer return, hold recall, park recall, automatic callback.

The Coverage Group is set through the user's User | Telephony | Supervisor Settings or through their associated User Rights | Telephony | Supervisor Settings. The only group settings used are:

- The list of group members. They are treated as a collective group regardless of the group's configuration.
- If the group has **Night Server Fallback Group** and or **Out of Service Fallback Group** set, the members of those groups are used if the coverage group is set to night service mode or out of service mode respectively.

# Chapter 90: Mobile Call Control

Mobile call control is only supported on digital trunks, including SIP trunks. It allows a user receiving a call on their twinned device to access system dial tone and then perform dialing action including making calls and activating short codes.

After answering a twinned call, the Mobile Call Control user can dial \*\* (within 1 second of each other) to place that call on hold and instead get dial tone from the system. Any dialing is now interpreted as if the user is logged into a basic single line extension on the system using their user settings. That also include user BLF status indication.

To use these features the user must be configured to support mobile call control.

## **Warning:**

- This feature allows external callers to use features on your phone system and to make calls from the phone system for which you may be charged. The only security available to the system is to check whether the incoming caller ID matches a configured users' **Twinned Mobile Number** setting. The system cannot prevent use of these features by caller's who present a false caller ID that matching that of a user configured for access to this feature.

## **Trunk Restrictions**

Mobile call control is only supported on systems with trunk types that can give information on whether the call is answered. Therefore, mobile call control is not supported on analog or T1 analog trunks. All other trunk types are supported (ISDN PRI and BRI, SIP (RFC2388), H323).

- Routing via trunks that do not support clearing supervision (disconnect detection) should not be used.
- DTMF detection is applied to twinned calls to a user configured for this feature. This will have the following effects:
- DTMF dialing is muted though short chirps may be heard at the start of any DTMF dialing.
- DTMF dialed by the user will not be passed through to other connected equipment such as IVR or Voicemail.

## **Mobile Call Control Features and FNE Services**

Mobile call control uses a short code set to invoke an FNE service. The codes relevant to mobile call control are summarized below.

| <b>FNE</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                          |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>31</b>  | <b>Mobile Call Control</b><br>This code allows a user called or calling the system to invoke mobile call control and to then handle and make calls as if they were at their system extension.                                                                                                                                                                                                               |
| <b>32</b>  | <b>Mobile Direct Access</b><br>Mobile direct access FNE32 immediately redials on switch the DDI digits received with the call rather than returning dial tone and waiting for DTMF digits as with FNE31 .                                                                                                                                                                                                   |
| <b>33</b>  | <b>Mobile Callback</b><br>Mobile callback allows the user to call the system and then hang up. The system will then make a call to the user's CLI and when answered, provide them with dial tone from the system to make calls.                                                                                                                                                                             |
| <b>35</b>  | <b>Simplified Mobile Call Control</b><br>In addition to the Mobile Call Control feature that enables your mobile to make and handle calls as if your are using your extension, this Simplified Mobile Call Control FNE 35 clears the dial tone when the call recipient ends the call. The dial tone is provided on the mobile phone for fresh calls after the current call is cleared.                      |
| <b>36</b>  | <b>Simplified Mobile Direct Access</b><br>In addition to the Mobile Direct Access feature, the Simplified Mobile Direct Access FNE36 clears the dial tone when the call recipient ends the call.                                                                                                                                                                                                            |
| <b>37</b>  | <b>Simplified Mobile Callback</b><br>In addition to the Mobile Callback feature that enables your mobile to get call back from the system and lets you use the dial tone for making and handling calls, this Simplified Mobile Callback FNE 37 clears the dial tone when the call recipient ends the call. The dial tone is provided on the mobile phone for fresh calls after the current call is cleared. |

The codes relevant to mobility are summarized in the table.

| <b>FNE Number</b> | <b>Feature</b>                           |
|-------------------|------------------------------------------|
| 00                | System Dial Tone                         |
| 01                | Steal Call                               |
| 02                | Auto Call Back                           |
| 04                | Forward All Calls                        |
| 05                | Forward Busy and No Answer Calls         |
| 06                | Call Forward Disable                     |
| 07                | Park Call                                |
| 08                | Call UnPark                              |
| 09                | Pick Up Group                            |
| 10                | Directed Call Pick Up                    |
| 12                | Withheld CLI (To External Calls off IPO) |
| 13                | Enable CLI (To External Calls off IPO)   |

*Table continues...*

| FNE Number | Feature                                       |
|------------|-----------------------------------------------|
| 14         | Conference Add                                |
| 15         | Drop Call                                     |
| 16         | Private Call (cannot be intruded or recorded) |
| 17         | Held Appearance Select                        |
| 18         | Same as FNE 00–Dial Tone Appearance (a=)      |
| 19         | Enable Twinning                               |
| 20         | Disable Twinning                              |
| 24         | DND On                                        |
| 25         | DND Off                                       |
| 26         | Blind Transfer                                |
| 27         | Transfer to Voicemail                         |

## Using Mobile Call Control

In addition to using \*\* to access mobile call control, the user has access to the following additional controls:

- **Clearing a Call: \*52** It may be necessary to clear a connected call, for example after attempting a transfer and hearing voicemail or ringing instead. To do this dial \*\* for dial tone and then \*52 (this is a default system short code and can be changed if required).
- **Return to Dial Tone: ##** Return to dial tone after getting busy, number unobtainable or short code confirmation tones from the system.

## Enabling Outgoing Mobile Call Control

1. **Configure the user for Mobile Twinning and Mobile Call Control** On the User | Mobility tab do the following:

- Enable **Mobility Features** for the user.
- Set the **Twinned Mobile Number** for the user's twinned calls destination.
  1. Digits are matched from right to left.
  2. The match must be at least 6 digits. If either the CLI or the Mobile Twinned Number is less than 6 digits no match will occur.
  3. Matching is done for up to 10 digits. Further digits are ignored. If either the CLI or Mobile Twinned Number is less than 10 digits, matching stops at that shorter length.
  4. If multiple matches occur the first user in the configuration is used. Manager will warn against configuration where such a conflict may exist.
- Select **Can do Mobile Call Control**.

On systems with some unsupported trunk types, further changes such as Outgoing Group ID, system shorts codes and ARS may be necessary to ensure that calls to the mobile twinned numbers are only routed via trunks that support mobile call control.

## Incoming Mobile Call Control

The system can be configured to allow Mobile Call Control users to use this function when making an incoming call to the system. This requires the user to make the incoming call from the same CLI as their Mobile Twinning Number (even if they do not actually use Mobile Twinning).

The call will be rejected:

- If the caller ID is blank or withheld.
- If the caller ID does not match a Twinned Mobile Number of a user with **Can do Mobile Call Control** enabled.
- If the call is received on a trunk type that does not support Mobile Call Control.

## Enabling Incoming Mobile Call Control

On the **User | Mobility** tab do the following:

1. Enable **Mobility Features** for the user.
2. Set the **Twinned Mobile Number** to match the CLI of the device from which the user will be making calls.
3. Select **Can do Mobile Call Control**.

**9x Add a FNE Short Code** In the system short codes section of the configuration add a short code similar to the following. Key points are the use of the **FNE Service** feature and the **Telephone Number** value 31.

- **Short Code:** \*89
- **Feature:** FNE Service
- **Telephone Number:** 31

 **Add an Incoming Call Route for the user** Create an incoming call route that matches the user's CLI and with the FNE short code created above as its destination.

On systems with some unsupported trunk types, further changes such as Incoming Group ID changes may be necessary to ensure that only calls received on trunks that support Mobile Call Control are routed to this short code.

---

## Mobile Direct Access (MDA)

For a Mobile Call Control or one-X Mobile client user, FNE32 immediately redials on switch the DDI digits received with the call rather than returning dial tone and waiting for DTMF digits as with FNE31. This is called Mobile Direct Access (MDA).

MDA requires the user's external telephony provider to provide a direct trunk with DDI to the system (ie. an ISDN or SIP trunk). By assigning a specific incoming line group ID to the trunk, an

incoming call route can be created for the same line group ID with blanks incoming number and incoming CLI fields. The destination is a short code set to FNE32.

User validation is performed using the CLI in the same way as for normal Mobile Call Control. In addition the call will be rejected no DDI digits are provided. Once connected the user can use the other Mobile Call Control features such as \*\*.

The screenshot displays the configuration interface for a BRI Line, divided into three tabs: BRI Line, Short Codes, and Channels.

**BRI Line Tab:**

- Line Number: 06
- Card: 2
- Port: 10
- Telephone Number: (empty)
- TEI: 0
- Incoming Group ID: 20 (highlighted with a red box)
- Outgoing Group ID: 0
- Prefix: (empty)
- Number of Channels: 2
- Line SubType: ETSI

**Standard Tab (under BRI Line):**

- Bearer Capability: Any Voice
- Line Group Id: 20 (highlighted with a red box)
- Incoming Number: (empty)
- Incoming Sub Address: (empty)
- Incoming CLI: (empty)

**Standard Tab (under Short Codes):**

| TimeProfile | Destination                      | Fallback Extension |
|-------------|----------------------------------|--------------------|
| Default     | *99 (highlighted with a red box) | (empty)            |

**Short Code Tab:**

- Code: \*99
- Feature: FNE Service (highlighted with a red box)
- Telephone Number: 32
- Line Group Id: 0

Blue arrows indicate the configuration flow: from the 'Incoming Group ID' field in the BRI Line tab to the 'Line Group Id' field in the Standard tab, and from the 'Destination' field in the Standard tab to the 'Feature' field in the Short Code tab.

---

## Mobile Callback

Mobile callback allows the user to call the system and then hang up. The system will then make a call to the user's CLI and when answered, provide them with dial tone from the system to make calls.

Mobile callback is subject to all the normal trunk type and user licensing restrictions of mobile call control. In addition the user must have the **Mobile Callback (User | Mobility)** setting enabled in the system configuration.

When the user makes a call using a DDI that is routed to an FNE33 short code, the system will not connect (answer) the call but will provide ringing while it waits for the user to hang up (after 30 seconds the system will disconnect the call).

- The system will reject the call if the CLI does not match a user configured for Mobile Callback or does not meet any of the other requirements for mobile call control.
- The system will reject calls using FNE33 if the user already has a mobile twinning or mobile call control call connected or in the process of being connected. This includes a mobile callback call in the process of being made from the system to the user.

If the CLI matches a user configured for mobile callback and they hang up within the 30 seconds, the system will within 5 seconds initiate a callback to that user's CLI.

- If the call is answered after the user's **Mobile Answer Guard** time and within the user's **No Answer Time**, the user will hear dial tone from the system and can begin dialling as if at their system extension.
- If the call is not answered within the conditions above it is cleared and is not reattempted.

## Transferring call notes

The following are some of the methods usable to transfer calls.

| Note                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Supervised Transfer</b>                   | This is a transfer where the user waits for the transfer destination to answer and talks to that party before completing the transfer, this is referred to as a consultation call. They then either complete the transfer or drop the call and return to the held for transfer call. The call details, display, ringing and forwarding applied are appropriate to the type of call (internal or external) being transferred. |
| <b>Unsupervised Transfer</b>                 | This is a transfer that is completed whilst the destination is still ringing. This is also called a 'blind transfer'.                                                                                                                                                                                                                                                                                                        |
| <b>Automatic Transfer - Forwarding</b>       | The system allows users to automatically transfer calls using forwarding options. For full details, see <a href="#">DND, Follow Me and Forwarding</a> on page 866.                                                                                                                                                                                                                                                           |
| <b>Transferring to a Forwarded Extension</b> | When transferring a call to another extension that has forwarding enabled, the type of call being transferred is used. For example, if transferring an internal call, if the transfer target has forwarding of internal calls enabled, then the forward is used.                                                                                                                                                             |

*Table continues...*

| Note                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Transferring Calls to Yourself</b> | User's can transfer calls to their own extension number. This is useful for users with multiple devices registered to the same extension number or users with twinned devices. It allows the user to transfer a call answered on one device and then answer it on another one of their devices.                                                                                                                                                               |
| <b>Reclaim</b>                        | If a transferred call is still ringing unanswered, it may be possible to reclaim the call. The default shortcode for this is *46.                                                                                                                                                                                                                                                                                                                             |
| <b>Transfer Return Time</b>           | <p>Sets the delay after which any call transferred by the user, which remains unanswered, should return to the user. A return call will continue ringing and does not follow any forwards or go to voicemail.</p> <ul style="list-style-type: none"> <li>• Transfer return only occurs if the user has an available call appearance button.</li> <li>• Transfer return is not applied if the transfer is to a hunt group that has queuing enabled.</li> </ul> |

## Transferring call notes

The following are the basic methods for transferring calls.

**Analog and single line phones**

| Action                       | Steps                                                                                                                                                                                                                                                                                                                                           |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Unsupervised Transfer</b> | <ol style="list-style-type: none"> <li>1. Press R. Note that broken dial tone is heard while a call is on hold.</li> <li>2. Dial the transfer destination number.</li> <li>3. Hang-up.</li> </ol>                                                                                                                                               |
| <b>Supervised Transfer</b>   | <ol style="list-style-type: none"> <li>1. Press R.</li> <li>2. Dial the transfer destination number.</li> <li>3. If the destination answers and accepts the call, hang-up.</li> <li>4. If the called party does not answer or does not want to accept the call, press R again.</li> <li>5. To return to the original caller press R.</li> </ol> |
| <b>Reclaim</b>               | *46                                                                                                                                                                                                                                                                                                                                             |

## Avaya multiple line phones

| Action                       | Steps                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Unsupervised Transfer</b> | <ol style="list-style-type: none"> <li>1. Press <b>↔ Transfer</b>.</li> <li>2. Dial the transfer destination number.</li> <li>3. Press <b>↔ Transfer</b> again to complete the transfer.</li> </ol>                                                                                                                                                                                                                                            |
| <b>Supervised Transfer</b>   | <ol style="list-style-type: none"> <li>1. Press <b>↔ Transfer</b>.</li> <li>2. Dial the transfer destination number.</li> <li>3. If the destination answers and accepts the call, press <b>↔ Transfer</b> again to complete the transfer.</li> <li>4. If the called party does not answer or does not want to accept the call, press <b>↩ Drop</b>.</li> <li>5. To return to the original caller press it's call appearance button.</li> </ol> |
| <b>Reclaim</b>               | *46                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Off-Switch Transfer Restrictions

Users cannot transfer calls to a destination that they cannot normally dial. This applies to manual transfers and also to automatic transfers (forwarding). In addition to call barring applied through short codes, the following system settings may restrict a users ability to transfer calls.

### User Specific Controls

| Setting                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Outgoing Call Bar</b>                   | <p>Default = Off (<b>Call Management &gt; Users &gt; Add/Edit Users &gt; Telephony &gt; Supervisor Settings</b>)</p> <p>When enabled, this setting stops a user from making any external calls. It therefore stops them making any external transfers or forwards.</p>                                                                                                                                                                                                                                                                                                                                                             |
| <b>Inhibit Off-Switch Forward/Transfer</b> | <p>Default = Off (<b>Call Management &gt; Users &gt; Add/Edit Users &gt; Telephony &gt; Supervisor Settings</b>).</p> <p>When enabled, this setting stops the specific user from transferring or forwarding calls externally. This does not stop another user transferring the restricted users calls off-switch on their behalf.</p> <ul style="list-style-type: none"> <li>• User attempts to set an external forward destination using a short code hear error tone.</li> <li>• User attempts to set an external forward destination using a programmable button on their phone do not allow the number to be saved.</li> </ul> |

## Line Specific Control

| Setting                                 | Description                                                                                                                                                                                                                                           |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Analog Trunk to Trunk Connection</b> | <p>Default = Off (<b>System Settings &gt; Line &gt; Add/Edit Trunk Line &gt; Analog Line &gt; Analog Options</b>)</p> <p>When not enabled, users cannot transfer or forward calls on one analog trunk back off-switch using another analog trunk.</p> |

•

## System Wide Controls

| Setting                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Inhibit Off-Switch Forward/Transfer</b> | <p>Default = On(<b>System Settings &gt; System &gt; Telephony</b>)</p> <p>When enabled, this setting stops any user from transferring or forwarding calls externally.</p> <ul style="list-style-type: none"> <li>• User attempts to set an external forward destination using a short code hear error tone.</li> <li>• User attempts to set an external forward destination using a programmable button on their phone do not allow the number to be saved.</li> </ul> |
| <b>Restrict Network Interconnect</b>       | <p>Default = Off (<b>System Settings &gt; System &gt; Telephony</b>).</p> <p>When this option is enabled, each trunk is provided with a Network Type option that can be configured as either <b>Public</b> or <b>Private</b>. The system will not allow calls on a <b>Public</b> trunk to be connected to a <b>Private</b> trunk and vice versa, returning busy indication instead.</p>                                                                                |

## Conference Control

Users can use conference controls to effectively transfer calls. This includes transferring an external call to another external number. The use of conferencing to effect off-switch transfers can be restricted using the **Inhibit External Only Impromptu Conference** setting (**System Settings > System > Telephony**).

[Transferring calls](#) on page 904

---

## Context Sensitive Transfer

**Calls and Button Status Indication** The status indication for a call on hold pending transfer has changed to differentiate such calls from standard held calls:

- On phones with both dual lamp buttons, both the green and red lamps fast flash (flutter) when the button represents a call on hold pending transfer.
- On phones with single lamp buttons or status icons, **Xfer:** is now shown in front of the caller ID information rather than the button name. For example **Xfer:Extn299** is shown rather than **a = Extn299**.

- The call status information shown when the button of a call on hold pending transfer is the currently highlight line is now prefixed with **On-Hold-Xfer** rather than **On-Hold**.

**Switching Between Calls** Switching from a connected call to an existing call on hold pending transfer puts the connected call on hold pending transfer. The following table is an example of the resulting operation .

|                                             |                                             |
|---------------------------------------------|---------------------------------------------|
| Call or answer A                            | Connected to A                              |
| Press <b>Transfer</b>                       | A on hold pending transfer                  |
| Call or answer B                            | A on hold pending transfer. Connected to B. |
| Reconnect to A                              | Connected to A. B on hold pending transfer  |
| Press <b>Transfer</b> or <b>Complete</b> *. | A transferred to B.                         |

**Requirement for a Free Call Appearance Before Starting a Transfer** When the user already has a call or calls on hold, they can now put their current call on hold pending transfer even if there are no free call appearances available. Previously an available call appearance was required in order to then make a consultation call to the potential transfer destination.

**Conferencing Calls** For these phone there have also been changes to which calls are conferenced in different scenarios including when there is a call on hold pending transfer. See Context Sensitive Conferencing.

## Dial Tone Transfer

A user who is not able to make external calls to any or some external numbers, can be transferred to dial tone by a user who is able to make external calls.

- The restricted user wanting to make the external call, dials the unrestricted user and requests dial tone.
- The unrestricted user initiates a transfer and dials the prefix for an ARS form configured to provide secondary dial tone.

The prefix is a short code set up to access the required ARS form. While this can be a system short code, using a user or user rights short code will allow control over who can provide dial tone transfer for restricted users.

- When they hear the secondary dial tone, the unrestricted user completes the transfer.
- The restricted user now hears the secondary dial tone and is now able to make an external call.
- The restricted user is now able to make calls as permitted by the short codes in the ARS form.

- The restricted user is not able to transfer the dial tone to another user.

The ARS form being used can still contain short codes that restrict the dialing that can be attempted after the restricted user hears secondary dial tone. Other ARS features can also be used such as alternate routing or time profiles to provide out of hours routing. The ARS form timers are run from when the unrestricted caller dials the ARS form. They are not reset when the restricted user is transferred to the ARS form.

Multiple prefixes and ARS forms can be used if required to create more complex scenarios. For example, one where the unrestricted user can transfer the restricted users to an ARS forms that allows international calls or to an ARS form that only allows national dialing.

### Example Configuration:

The example below is a simple configuration that allows the unrestricted user to use 8 as a transfer destination that provides secondary dial tone.

**Create an ARS Form for Secondary Dial Tone** The ARS form needs to be created before short codes can be added to route callers to it.

- Enter a **Route Name** to identify the ARS form, for example `Dial Tone Trans.`
- Select **Secondary Dial Tone**.
- Select either **System Tone** (this matches locale specific normal dial tone) or **Network Tone** (this matches locale specific secondary dial tone). For some locales both tones are the same.
- Enter short codes that will take any digits dialed by the restricted user and process them for external dialing to an outgoing line group. For this example we will allow any digits dialed to be presented to the first trunk seized in outgoing line group 0.

|                         |      |
|-------------------------|------|
| <b>Code</b>             | N    |
| <b>Telephone Number</b> | N    |
| <b>Feature</b>          | Dial |
| <b>Line Group ID</b>    | 0    |

- Other short codes can be used to allow or bar the dialing of specific numbers or types of numbers.
- Configure the rest of the ARS form as required. For full details on ARS form configuration see ARS.

**Create a Short Code for Dial Tone Transfer** For this example we will allow the prefix 8 to be used to access an ARS form created above.

In the user short codes of the unrestricted user, create a short code that invokes the ARS form created above. For example:

|                         |   |
|-------------------------|---|
| <b>Code</b>             | 8 |
| <b>Telephone Number</b> |   |

*Table continues...*

|                      |                    |
|----------------------|--------------------|
| <b>Feature</b>       | Dial               |
| <b>Line Group ID</b> | 51 Dial Tone Trans |

- It is important that the short code does not pass any digits to the ARS form. Once the ARS form receives any digits, it starts short code matching and ends secondary dial tone.
- The short code could also be setup as a system or user rights short code.

The unrestricted user is now able to provide secondary dial tone to other users by on request by pressing **Transfer**, dialing **8** and then pressing **Transfer** again.

#### Account and Authorization Codes:

If the restricted user enters an account or authorization code while calling the unrestricted user to request dial tone, that value is not carried forward with their external call once they have been provided with secondary dial tone.

If the unrestricted user enters an account or authorization code while dialing the ARS form, that value remains associated with the call made by the restricted user.

If the ARS form short code used to route the restricted users call requires an account or authorization code, the value already entered is used, otherwise the restricted user is prompted to enter a value.

#### Call Logging:

The restricted user's outgoing call log will include the call to the unrestricted user and the outgoing external call they subsequently make. The outgoing external call record will include the prefix dialed by the unrestricted user to access the ARS form.

The unrestricted users call log will include just an incoming call from the restricted user.

Within the SMDR output, the calls by the restricted user are included. The call by the unrestricted user is not included.

---

## Handsfree Announced Transfers

This feature allows the enquiry call part of a supervised transfer to be answered handsfree. In addition the system can be optionally configured to allow both the enquiry call and completed transfer call to be auto-answered.

#### Example:

1. User 201 answers a call that they then want to transfer to user 203.
2. They press **Transfer** to put the call on hold pending transfer.
3. They then press a **Dial Direct** button and dial 203.

4. The transfer enquiry call is auto answered by User 203's phone. User 201 is able to announce the pending transfer and hear if User 203 wants to accept the call.

The auto-answer only occurs if the target user's extension is idle. If the target is already connected to a call, the transfer enquiry will be presented as normal call.

If the transfer is accepted, User 201 can press **TRANSFER** again to complete the transfer process.

The transferred call will then ring at the target. However, if required the system can be configured to also auto-answer the completed transfer.

### Configuration:

Handsfree announced transfers are supported when using one of the following features after having pressed **TRANSFER**.

| Button Features                                    | Short Code Features |
|----------------------------------------------------|---------------------|
| Dial Direct<br>Automatic Intercom<br>Dial Intercom | Dial Direct         |

### User Button Usability:

Following the use of any of the buttons above, if the button has not been programmed with a specific target, a User button can be used to indicate the target for the enquiry call. This gives the advantage of being able to see the target user's status before attempting the transfer.

- For **Automatic Intercom** and **Dial Intercom** buttons without a pre-specified target, the **User** button must be on a button module.
- For **Dial Direct** buttons without a pre-specified target, the **User** button can be on the phone or button module. Due to this and the support for **Dial Direct** across a network of systems, we recommend that a **Dial Direct** button is used for handsfree announced transfers.

### Phone Support:

Handsfree announced transfer is supported for calls being transferred to the following phones:

| Full Support                                                                                                                                                                                                                        | Partial Support                                                                                                                                                      | Not Supported                                                                                                                                                                                     |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The following system phones support full announced transfer operation.</p> <p><b>1603, 1608, 1616, 2410, 2420, 5410, 5420, 4610, 4621, 4625, 5610, 5620, 5621.</b></p> <p><b>Analog Off-Hook Stations</b> (See notes below).</p> | <p>The following phone can auto-answer announced transfers but require the user to use the handset to respond.</p> <p><b>2402, 4601, 4602, 5402, 5601, 5602.</b></p> | <p>Announced transfer is not supported for any phones not listed in the other column.</p> <p>On unsupported phones the transfer enquiry consultation call will be presented as a normal call.</p> |

**Notes:**

- On supported phones, if the target user's phone is not idle when the enquiry call attempt is made, the enquiry call is turned into a normal transfer attempt, eg. alerting on an available call appearance.
- Enabling the extension specific setting **Disable Speakerphone** will turn all auto-answer calls, including handsfree announced transfers to the extension, into normal calls.
- **Off-Hook Station Analog Phones** Analog phone extensions configured as Off-Hook Station can auto-answer transfers when off-hook and idle.
- **Headset Users** The following applies to users on supported phones with a dedicated **HEADSET** button. These users, when in headset mode and idle will auto-answer the announced transfer enquiry call through the headset after hearing 3 beeps. The transfer completion will require them to press the appropriate call appearance unless they are set to Headset Force Feed.
- **Twinning** Handsfree announced transfer calls to users with twinning enabled will be turned into normal calls.
- **Multi-site network Support** Dial Direct is supported to targets across a multi-site network, therefore allowing handsfree announced transfers to remote users.

**Full Handsfree Transfer Operation:**

If required the system can be configured to allow the full handsfree announced transfer process, ie. both the enquiry call and the transfer, to be auto-answered on supported phones. This is done by entering `FORCE_HANDSFREE_TRANSFER` into the Source Numbers of the NoUser user and rebooting the system

---

## One Touch Transferring

This feature allows selected users to transfer calls to each other using a reduced number of key presses.

With this option, a call can be transferred by simply selecting the transfer destination and then hanging up (or pressing **Transfer** if working handsfree).

Without this option the normal sequence is to press **Transfer**, dial the destination and then hanging up (or pressing **Transfer** if working handsfree).

For one touch transfer the transfer destination number must be selected using a button programmed to one of the following features:

- **User**
- **Dial**

- **Abbreviated Dial**
- **Automatic Intercom**
- **Dial Intercom**
- **Dial Direct**

This feature is enabled on a per user basis by adding `Enable_OTT` to the **Source Number** settings of the user. This feature is supported on all Avaya phones that support the programmable button features.

## Centrex Transfer

Centrex Transfer is a feature provided by some line providers on external analog lines. It allows the recipient of a calls on such a line to transfer that call to another external number. The transfer is performed by the line provider and the line is freed. Without Centrex Transfer, transferring an external call to another external number would occupy both a incoming and outgoing line for the duration of the call.

The following are the supported controls and usages for Centrex Transfer:

- **Centrex Transfer Button Operation** The action **Flash Hook** can be assigned to a programmable button. This button can be configured with or without a telephone number for an automatic or manual transfer.
  - **Manual Transfer** If the programmable button is setup without a target telephone number, pressing the button returns dial tone to the user. They can then dial the required transfer number and when they hear ringing or an answer, hang up to complete the Centrex Transfer.
  - **Automatic Transfer** If the programmable button is setup with a target telephone number, pressing the button performs the Centrex Transfer to the number as a single action.
- **Centrex Transfer Short Code Operation** The **Flash Hook** short code feature can be used with system short codes. It can be setup with or without a telephone number in the same way as a Flash Hook programmable button above. The line group must be the group of analog lines from the Centrex service line provider.
  - **Centrex Transfer Operation for Analog Extensions** Most analog phones have a button that performs the action of sending a hook flash signal. The marking of the button will vary and for example may be any of **R**, **H**, **Recall** or **Hold**. Pressing this button sends a hook flash to the system to hold any current call and return dial tone.
    - To perform a Centrex Transfer, pressing the analog extension's hook flash button should be followed by the dialing of a **Flash Hook** short code.
    - For analog extension users with call waiting enabled, pressing the hook flash button during a call will hold the current call and connect any call waiting. Therefore it is

recommend that analog extension users wanting to use Centrex Transfer should not also have call waiting enabled.

- **Auto Attendant Transfer** System's using embedded voicemail can select Centrex Transfer as an action. For system using Voicemail Pro, the equivalent can be achieved by transferring calls to a **Flash Hook** short code.

### Additional Notes

- **Networked Systems** In networked systems, Centrex Transfer is only supported using **Flash Hook** or **Centrex Transfer** features on the system which hosts the Centrex analog trunks.
- **Addition Prefix Dialing** In some cases the Centrex service provider may require a prefix for the transfer number. If that is the case, that prefix must be inserted in the button programming or the short code used for the Centrex Transfer.
- **Application Transfers** Centrex Transfer is not supported for calls being held and transferred through applications such as SoftConsole.
- **Conference Calls** Centrex Transfer is not supported with conference calls.

# Chapter 92: Simultaneous mode

IP Office systems support 'simultaneous' mode operation. In that mode, users can be associated with multiple telephony devices at the same time. They can answer and make calls on any of those devices.

## Related links

[Simultaneous Mode Devices](#) on page 915

[Simultaneous Mode Notes](#) on page 915

[Moving Calls Between Simultaneous Devices](#) on page 916

---

## Simultaneous Mode Devices

An IP Office user can be logged in simultaneously on one of each of the following types of telephone devices:

| Telephony Client            | Notes                                                                                                                           |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| A physical desk phone       | A physical phone, including a SIP, H.323 or DECT extension. This also includes clients running on a Vantage phone.              |
| A desktop (PC) VoIP client: | <ul style="list-style-type: none"><li>• Avaya Workplace Client for Windows</li><li>• Avaya Workplace Client for macOS</li></ul> |
| A mobile VoIP client:       | <ul style="list-style-type: none"><li>• Avaya Workplace Client for Android</li><li>• Avaya Workplace Client for iOS</li></ul>   |
| A WebRTC client:            | <ul style="list-style-type: none"><li>• Avaya Calling using the Chrome extension.</li></ul>                                     |

## Related links

[Simultaneous mode](#) on page 915

---

## Simultaneous Mode Notes

The following notes relate to the operation of simultaneous telephony:

- Incoming calls to the user alert on all their devices and they can choose which device they want to use to answer.

- Whilst the user has a call in progress on one of the devices, any additional incoming call is presented only to that device.
- It is recommended not to mix simultaneous mode operation with features such as mobile twinning, telecommuting and mobile call controls that can lead to multiple duplicate calls. For example, a mobile client's external PSTN numbers as a active mobile twinning destination will cause duplicate alerts for the same call.
- Users can have their desk phone and their softphone applications registered to different servers in an IP Office network.
- Use of simultaneous mode is not supported when also using a non-telephony CTI client to control call handling. In that scenario it is not always possible to predict which telephony client will be used when making/answering a call from the CTI client which can lead to confusion.

## Moving Calls Between Simultaneous Devices

The IP Office system supports a number of features to enable users to move calls between their simultaneous devices.

| Action                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Transfer</b>          | Users can transfer calls to their own extension number. That causes the call to alert on their other simultaneous devices.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Steal</b>             | For IP Office R11.1.2.4 and higher, a <b>Call Steal</b> shortcode set to with the user's extension number will retrieve a current call from their other simultaneous device.                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Workplace Clients</b> | <p>For IP Office R11.1.3 and higher, Avaya Workplace Client users can use their client to move and retrieve calls:</p> <ul style="list-style-type: none"><li>• Using move, the user can send a call from their Avaya Workplace Client to their other simultaneous devices.</li><li>• Using retrieve, the user can move a call answered on their simultaneous device to their Avaya Workplace Client.</li></ul> <p>These features are enabled by a <code>SET IPO_CALL_HANDOVER_ENABLED 1</code> line in the <code>46xxsettings.txt</code> file.</p> |

[Simultaneous mode](#) on page 915

# Chapter 93: User Source Numbers

Source numbers are used to configure features which do not have specific controls within the IP Office Manager or IP Office Web Manager interfaces.

Sources numbers are divided into two types:

- User source numbers are used to apply settings to individual users.
- NoUser source numbers are used to apply settings to the IP Office system or to all users on the system.

Note that the lists shown on the following pages are not exhaustive.

- Some source numbers are made obsolete when replaced by proper configuration controls in a later release of IP Office software. At that stage, the source number is no longer supported.
- This document covers the source numbers that are publicly supported. Other source numbers issued for particular customer sites to resolve specific issues at those sites are not included and are not supported on other IP Office systems.

[Individual User Source Numbers](#) on page 917

[NoUser Source Numbers](#) on page 919

---

## Individual User Source Numbers

### User Source Numbers

The following source numbers affect the particular user to which they are applied. They are mergeable unless stated otherwise.

- **AT<string>**

Strings beginning with AT are used with a user called **DTEDefault** to configure the default settings of the control unit's DTE port.

- **BST\_MESSAGE\_FOR\_YOU**

Replace the date and time shown on BST phones when idle with `Message for you` or `Messages for you` when the user has new voicemail messages. This source number can be used as a `NoUser` source number to enable the feature for all BST phone users.

- **BST\_NO\_MESSAGE\_FOR\_YOU**

If the source number **BST\_MESSAGE\_FOR\_YOU** has been used as a `NoUser` source number to enable the feature for all BST phone users, this individual user source number can be used to disable the feature for selected users.

- **C<Conference ID>**

Provides the user with message waiting indication and access to the conference mailbox of a system meet-me conference. Access is through Visual Voice and the User Portal application.

- **Enable\_OTT**

Enable one touch transfer operation for the user. See [One Touch Transferring](#) on page 912. This source number can be used as a `NoUser` source number to enable the feature for all users.

- **H<Group Name>**

Allows the user to receive message waiting indication of new group messages. The group is added to the user's Visual Voice menu. On suitable display extensions, the hunt group name and number of new messages is displayed. Refer to the appropriate telephone user guide.

- If the user is not a member of the group, a voicemail code must be set for the group's mailbox (**Group | Voicemail | Voicemail Code**).

- **P<Telephone Number>**

This record sets the destination for callback (outbound alert) calls from voicemail. Enter **P** followed by the telephone number including any necessary external dialing prefix, for example **P917325559876**. This facility is only available when using Voicemail Pro on which a default or user specific **Callback** start point has been added. Refer to the *Administering IP Office Voicemail Pro* manual. This feature is separate from voicemail ringback and Voicemail Pro outcalling.

- **R<Caller ICLID>**

To allow Dial In/RAS call access only from a specified number prefix the number with a **R**. For example **R7325551234**.

- **U<User Name or Extension Number>**

Allows the user to receive message waiting indication of new messages. The specified user is added to the user's Visual Voice menu. On suitable display extensions, the user name and number of new messages is displayed. Refer to the appropriate telephone user guide.

- If the user is not a trusted source for the mailbox, they will need to enter its **Voicemail Code** to access the mailbox.

- **V<Caller ICLID>**

Strings prefixed with a **v** indicate numbers from which access to the users mailbox is allowed without requiring entry of the mailbox's voicemail code. This is referred to as "trusted source".

- For Voicemail Pro running in Intuity mode, trusted source is used for calls from programmable buttons set to **Voicemail Collect** and **Visual Voice**. Other controls are prompted for the mailbox number and then password.

[User Source Numbers](#) on page 917

# NoUser Source Numbers

The following source numbers affect all users on the IP Office system. They are entered through the **Source Numbers** tab of the **NoUser** user. These source numbers are informally referred to as *NUSNs*.

## ! Important:

- Adding and changing these source numbers require a system reboot to become effective.

## NoUser Source Numbers

- `ATM4U_PCS7_RINGDETECT`

For some cellular or mobile interfaces connected to a IP500 ATM4U card, the card may not detect the ring signal. For PCS4 and higher card, this `NoUser` source number can be used activate alternate ring detection.

- `ALLOW_5410_UPGRADES`

This option must be present for 5410 phones to update their firmware.

- `B_DISABLE_SIP_IPADDR`

Disables blacklisting of SIP device registration based on the device IP address. Refer to the *Avaya IP Office™ Platform Security Guidelines* manual.

- `BST_MESSAGE_FOR_YOU`

Replace the date and time shown on BST phones when idle with `Message for you` or `Messages for you` when the user has new voicemail messages. This source number can also be set as a source number for individual users.

- `CIPHERS_LEVEL_H323=<N>`

Sets the minimum cipher strength the IP Office accepts on TLS connections for H.323 phones and trunks. Not used for clients where ciphers are enabled and chosen based on those offered by the TLS server.

- Supported for IP Office R11.1.2.x releases. For IP Office R11.3.1 and higher, this NUSN is replaced by the **System > Certificates > H.323 Security Level** security setting.
- Note: The default level 1 (medium strength) is used if no source number is specified.

The value `<N>` is set as follows:

- **Low** (0) - Accept low, medium, and high-strength ciphers. Low and medium on IP500 V2 systems.
- **Medium** (1) - Accept medium and high-strength ciphers. Medium on IP500 V2 systems.
- **High** (2) - Accept high-strength ciphers. Not supported for IP500 V2 systems.
  - For a list of ciphers, see *Avaya IP Office™ Platform Security Guidelines*.
  - High-strength ciphers are GCM ciphers. These are not supported by any model of IP500 V2 system.

- `CIPHERS_LEVELS_SIP=<N>`

Sets the minimum cipher strength the IP Office accepts on TLS connections for SIP phones and trunks. Not used for clients where ciphers are enabled and chosen based on those offered by the TLS server.

- Supported for IP Office R11.1.2.x releases. For IP Office R11.3.1 and higher, this NUSN is replaced by the **System > Certificates > SIP Security Level** security setting.
- Use the same values as `CIPHERS_LEVEL_H323=` but sets the cipher level the IP Office accepts for SIP TLS connections.

- `DECT_REVERSE_RING`

By default, when this parameter is not set, calls on DECT phones associated with a CTI application will ring as a priority call. When this parameter is set, DECT phones ring as a normal, external or internal call.

- `DISABLE_USERBLF_DND_MENU`

On phones with a **User** button, disable the display of options when the button is pressed and instead call the targeted user. For the call to alert a DND user rather than be redirected as per normal DND operation, you must add the button user's number to the targeted user's **DND Exceptions** list. Supported with 9400, 9500, 9600,, and J100 phones.

- `DISTINCT_HOLD_RINGBACK`

Used to display a specific message about the call type for calls returning after timing out from being parked or held. If set, such calls display **Return Call - Held** or **Return Call – Parked** rather than connected party name or line name.

- `ENABLE_J100_FQDN`

Use FQDN rather than IP addresses in the server address values provided to J100 Series phones. This requires that the FQDN values are correctly routable by the customer DNS servers and that the phones use the DNS server address (either obtained through DHCP or set manually).

- `ENABLE_J100_AUTO_UPDATE_POLICY`

Add settings for J100 Series phone auto-upgrade support to the system's auto-generated `46xxsettings.txt` file. Refer to the *IP Office SIP Telephone Installation Notes* manual.

- `Enable_OTT`

Enable one touch transfer for all users. This source number can also be set as a source number for individual users.

- `EQNX_CONTACT_MATCHING_MIN_DIGITS=<N>`

By default the Avaya Workplace Client requires at least 10 digits for contact matching (8 for Bahrain). This `NoUser` source number can be used to define the minimum digits for contact matching for countries where national dial plan phone numbers are less than 10 digits.

- `FORCE_HANDSFREE_TRANSFER`

If set, when using the handsfree announced transfer process, both the transfer enquiry and transfer completion calls are auto-answered. Without this setting only the transfer enquiry call is auto-answered.

- `FORCE_SIP_SBC_TCP_SINGLE_PORT`

Force the IP Office to open only one socket to the ASBCE for each client, regardless of the number of calls. Doing this can resolve issues with calls giving one ring on client and then appearing as a missed call.

- `HIDE_CALL_STATE`

Used to hide the call status information, for example `Dial` and `Conn`, shown on older DS phones such as 2400, 4400 and 5400 Series. Used in conjunction with the `LONGER_NAMES` source number.

- `HOLD_MUSIC_TIMEOUT=<seconds>`

By default, line alternate music sources remain connected for 30 seconds after they stop being used. You can use this source number to change the disconnect timeout. The supported range is 1 to 600 seconds.

- `LONGER_NAMES`

Used to increase the length of names sent for display on older DS phones such as 2400, 4400 and 5400 Series.

- `MEDIA_NAT_DM_INTERNAL=N`

Used in conjunction with the setting **System | VoIP | Allow Direct Media Within NAT Location**. When **Allow Direct Media Within NAT Location** is enabled, the default behavior is to attempt direct media between all types of devices (H323 and SIP remote workers and IP Office Lines behind a NAT). For routers using H323 ALG or SIP ALG, it can be desirable to only attempt direct media between certain device types. In this case, set this NoUser user source number where N is the sum of the following values:

- 1 = Include H323 phones.
- 2 = Include SIP phones.
- 4 = Include IP Office lines.

For example, if the router has SIP ALG that cannot be disabled, to disable attempting NAT direct media for SIP devices, set `MEDIA_NAT_DM_INTERNAL=5` to include only H323 phones and IP Office Lines.

- `NI2_CALLED.../NI2_CALLING...`

The following NoUser source numbers are applied to calls on ETSI PRI trunks:

- `NI2_CALLED_PARTY_PLAN=X`

Forces the NI2 Called Party Numbering plan for ETSI PRI trunks, where X equals UNKNOWN or ISDN.

- `NI2_CALLED_PARTY_TYPE=X`

Forces the NI2 Called Party Numbering type for ETSI PRI trunks, where X equals UNKNOWN, INT, NATIONAL or SUBSCRIBER.

- `NI2_CALLING_PARTY_PLAN=X`

Forces the NI2 Calling Party Numbering plan for ETSI PRI trunks, where X equals UNKNOWN or ISDN.

- `NI2_CALLING_PARTY_TYPE=X`

Forces the NI2 Calling Party Numbering type for ETSI PRI trunks, where X equals UNKNOWN, INT, NATIONAL or SUBSCRIBER.

- NO\_DIALLED\_REF\_EXTERNAL

On outgoing external calls made using short codes, the short code dialed is displayed on the user's phone and any directory matching is based on that number. This source number changes the behavior to display the telephone number output by the short codes and base directory matching on that number.

- onex\_...

The following NoUser source numbers are used to alter the IP addresses used for Avaya one-X® Portal for IP Office access.

- onex\_l1=<IP Address>

Sets the IP address of the one-X server that can be accessed by clients registered on the LAN1 interface.

- onex\_l2=<IP Address>

Sets the IP address of the one-X server that can be accessed by clients registered on the LAN2 interface.

- onex\_port\_l1=<IP Address>

Sets the port of the one-X server that can be accessed by clients registered on the LAN1 interface.

- onex\_port\_l2=<IP Address>

Sets the port of the one-X server that can be accessed by clients registered on the LAN2 interface.

- onex\_port\_r1=<IP Address>

Sets the port of the one-X server that can be accessed by remote clients registered on the LAN1 interface.

- onex\_port\_r2=<IP Address>

Sets the port of the one-X server that can be accessed by remote clients registered on the LAN2 interface.

- onex\_r1=<IP Address>

Sets the IP address of the one-X server that can be accessed by remote clients registered on the LAN1 interface.

- onex\_r2=<IP Address>

Sets the IP address of the one-X server that can be accessed by remote clients registered on the LAN2 interface.

- PHONE\_LANGUAGES

Cause an IP Office system to output a set of language files that can then be used to customize the text used on some phones. Refer to the *Avaya IP Office Locale Settings* manual.

- `PRESERVED_CONN_DURATION=<Minutes (1 to 120)>`

When **System | Telephony | Telephony | Media Connection Preservation** is enabled, active calls are preserved for up to 120 minutes before being disconnected.. This NoUser source number can be used to adjust the duration in the range 1 to 120 minutes.

- `PRESERVED_NO_MEDIA_DURATION=<Minutes (1 to 120)>`

When **System | Telephony | Telephony | Media Connection Preservation** is enabled, calls on which no RTP, RTCP or speech is detected are disconnected after 10 minutes. This NoUser source number can be used to adjust the duration in the range 1 to 120 minutes.

- `PUBLIC_HTTP=<File server address>`

If the IP Office is using the HTTP Redirection settings, this source number can be used to set a separate redirection address to be given to remote phones.

- `REPEATING_BEEP_ON_LISTEN`

By default, if you set **Beep on Listen**, when a user invokes **Call Listen** they hear an entry tone (3 beeps) only at the start of the call. When this parameter is set, they also hear a beep every 10 seconds.

- `RTCP_COLLECTOR_IP=<IP Address>`

When using a Prognosis server for call quality monitoring, set the IP address of the IP Office system as configured in the Prognosis server.

- `RW_SBC_...`

Set the IP addresses that remote SIP extensions should use to connect to the IP Office via an ASBCE. For R11.1.2.4 and higher, these have been replaced with settings on the **System | LAN | Network Topology** menus.

- `SET_46xx_PROCPSWD=<NNNNN>`

Set the new password indicated to phones through the auto-generated 46xxsettings.txt file.

- `SET_96xx_SIG=<X>`

When set, inserts the line `SET SIG X` into the auto-generated 46xxsettings.txt settings files.

- `SET_ADMINPSWD=<NNNNN>`

Set the new admin password indicated to K100 Series phones through the auto-generated 46xxsettings.txt file.

- `SET_B199_FW_VER=<NNNN>`

If set, overrides the default B199 firmware version the IP Office system inserts into its auto-generated `avayab199_fw_version.xml` file. with `firmware-NNNN-release.kt`. Supported for IP Office R11.1.2.4 and higher.

- `SET_CDNL="<NNNN>"` or `SET_CDNL="<NNNN>","<MMMM>"`

For Avaya Workplace Client clients on mobile iOS and Android devices, this source number specifies numbers to dial using the device's native dialer rather than using by the client application. The IP Office adds the numbers to the auto-generated 46xxsettings file as

a `SET CELLULAR_DIRECT_NUMBER_LIST=` entry. For details, refer to the *IP Office Avaya Workplace Client Installation Notes* manual.

- The source number can specify multiple numbers, separated by commas, in a string of up to 63 characters.
- You can use multiple `SET_CDNL=` entries.
- The maximum length of the `SET CELLULAR_DIRECT_NUMBER_LIST=` string is 127 characters.

- `SIP_ENABLE_HOT_DESK`

By default, the use of hot-desking on J129 and H175 phones is blocked. This source numbers overrides that behavior.

- `SIP_EXTN_CALL_Q_TIMEOUT=<Minutes>`

Sets the unanswered call duration after which unanswered SIP calls are automatically disconnected. If not set, the normal default is 5 minutes. This `NoUser` source number can be used to adjust the duration in the range 0 (unlimited) to 255 minutes.

- `SET_HEADSYS_1`

If set, alters the operation of the headset button on 9600 Series phones via the auto-generated `46xxsettings.txt` settings file. Normally the headset goes off-hook when the far end disconnects. When this option is set, the headset remains on-hook when the far end disconnects.

- `SET_J100_PAGE_VOLUME_MIN`

Specifies the minimum PAGE volume level for emergency announcements on J-Series IP phones connected to Avaya IP Office.

Type: Integer

Min: 1

Max: 16

Default: 10

If the value is set to 1, the minimum PAGE volume is effectively disabled, and users can adjust the volume freely.

- `SET_STIMULUS_SBC_REG_INTERVAL=<seconds>`

Set the registration interval used for remote J100 Series phones. Reducing this is necessary if the SBC fails to send `TCP_RST` end-to-end. The recommend value is 180 seconds. If not specified, the default is 1 hour (3600 seconds). Range 180 to 3600 seconds.

- `SIP_OPTIONS_PERIOD=<Minutes>`

On SIP trunks, the system periodically sends `OPTIONS` messages to determine if the SIP connection is active. The rate at which the messages are sent is determined by the combination of the **Binding Refresh Time (seconds)** set on the Network Topology tab and the **SIP\_OPTIONS\_PERIOD** parameter (in minutes). The frequency of sent messages is determined as follows:

| Target                | Method                                                                                                                                                                                                                                                              |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 300 seconds           | If no <b>SIP_OPTIONS_PERIOD</b> parameter is defined and the <b>Binding Refresh Time (seconds)</b> is <b>0</b> , then the default value of 300 seconds is used.                                                                                                     |
| Less than 300 seconds | Do not define a <b>SIP_OPTIONS_PERIOD</b> parameter and set the <b>Binding Refresh Time (seconds)</b> to a value less than 300 seconds.                                                                                                                             |
| More than 300 seconds | Set both the <b>SIP_OPTIONS_PERIOD</b> and <b>Binding Refresh Time (seconds)</b> to a value greater than 300 seconds.<br><br>The <b>OPTIONS</b> message period used is the smaller of the <b>Binding Refresh Time (seconds)</b> and the <b>SIP_OPTIONS_PERIOD</b> . |

- **SUPPRESS\_ALARM=1**

When set, the NoCallerID alarm is not shown in system alarms, SysMonitor and System Status Application .

- **TUI:J139\_REDUCED\_FEATURE\_SET**

For R11.1.2.4 and higher, reinstate the pre-R11.1.2.4 feature restrictions applied to J139 phones.

- **TUI:NAME\_SEARCH\_MODE=<n>**

The default directory search matching used on feature phones is to simultaneously show matches against all parts of names. This source number can be used to change the name matching behavior.

- 1 = Match starting from start of name.
- 2 = Match starting from last word in name.
- 3 = Match simultaneously from both 1 & 2.
- 4 = Match from the penultimate word in name.
- 7 = Match simultaneously from first, last and penultimate words in name.

- **TUI:NO\_TOVM\_SK\_WHEN\_VMOFF**

On feature phones, suppress the display of the **To VM** softkey when the user's VoiceMail setting is off.

- **VM\_TRUNCATE\_TIME=<Seconds: 0 to 7>**

Analog trunks can use busy tone detection to end calls. On calls that go to voicemail, to be recorded or to leave a message, when busy tone detection occurs, the IP Office indicates to the voicemail server how much to remove from the end of the recording in order to remove the busy tone segment. By default, the amount varies to match the system locale (refer to the *Avaya IP Office Locale Settings* manual).

For some systems, it may be necessary to override the default if the end of analog call recordings is either being clipped or includes busy tone. This NoUser source number can be used to adjust the amount removed in the range 0 to 7 seconds.

- **VMAIL\_WAIT\_DURATION=<Milliseconds>**

Sets the number of milliseconds to system waits before passing call audio to Voicemail. On some systems, a delay may be required to allow completion of codec negotiation.

- VMPRO\_OOB\_DTMF\_OFF

Disable the sending of out-of-band digits to the Voicemail Pro voicemail server. This may be necessary on some systems if digit presses are being recorded on calls.

- WEBRTC\_...

These source numbers are used for WebRTC support when the User Portal user connects to the remotely using either STUN and/or TURN. For R11.1.2.4 and higher, these have been replaced with settings on the **System | LAN | Network Topology** menus.

- xmpp\_port...

- These NoUser source numbers can be used Avaya one-X® Portal for IP Office to alter the ports used for XMPP connections.

- xmpp\_port\_l1=<Port>

- Set the port of the XMPP server used by clients registered on the LAN1 interface.

- xmpp\_port\_l2=<Port>

- Set the port of the XMPP server used by clients registered on the LAN2 interface.

- xmpp\_port\_r1=<Port>

- Set the port of the XMPP server used by remote clients registered on the LAN1 interface.

- xmpp\_port\_r2=<Port>

- Set the port of the XMPP server used by remote clients registered on the LAN2 interface.

# Part 12: SIP Trunks

## Editing Configuration Settings

# Chapter 94: SIP Trunk Overview

A growing number of service providers now offer PSTN access to businesses via public SIP trunk connections, either to extend their reach beyond their typical copper based network coverage areas, or so that multiple services (voice and internet access) can be bundled into a single network connection. Although detailed public SIP trunk service offerings vary depending on the exact nature of the offer from the specific service provider, SIP trunks can potentially provide several advantages compared to traditional analog or digital trunks. These advantages include:

- cost savings resulting from reduced long distance charges, more efficient allocation of trunks, and operational savings associated with managing a consolidated network
- simplified dialing plans and number portability
- geographic transparency for local accessibility creating a virtual presence for incoming calls
- trunk diversity and redundancy
- multi-media ready to roll out future SIP enabled applications
- fewer hardware interfaces to purchase and manage, reducing cost and complexity
- faster and easier provisioning

IP Office delivers functionality that enhances its ability to be deployed in multi-vendor SIP-based VoIP networks. While this functionality is primarily based on the evolving SIP standards, there is no guarantee that all vendors, interpret and implement the standards in the same way. To help the SIP service provider, Avaya operates a comprehensive SIP Compliance Testing Program referred to as GSSCP. Avaya's DevConnect program validates the operation of the IP Office solution with the service provider's SIP trunk offering.

## Configuring a SIP Trunk

This procedure provides the basic steps for configuring a SIP trunk between two IP Office systems.

### Before you begin

- You must know the IP address of both ends of the trunk.

- You must have valid licenses on both IP Office systems.
- On Server Edition, make sure you have a non-zero value in the **SIP Trunk Sessions** field on the **License | Remote Server** tab. If you do not, you will see Monitor messages about insufficient licenses.

## Procedure

1. In the Manager navigation pane, right click **Line** and select **New > SIP Line**.
2. Record the **Line Number** value that appears on the SIP Line page for use later.
3. In the **ITSP Domain Name** field, enter the domain name required by the far end. If nothing is configured in this field, then IP Office inserts the far end's **ITSP Proxy Address** from the **Transport** tab as the ITSP domain in the SIP messaging.
4. Use the default values for the remaining fields.
5. Select the **Transport** tab.
6. In the **ITSP Proxy Address** field, enter the IP Address of the far end.
7. Select the **SIP URI** tab.
8. Click **Add**.
9. Enter values for the **Incoming Group** and **Outgoing Group** fields. You can use the **Line Number** from the **SIP Line** tab for both values.
10. In the Manager navigation page, select **Incoming Call Route**.
11. On the **Standard** tab, in the **Line Group ID** field, enter the **Line Number** from the **SIP Line** tab.
12. Select the **Destinations** tab.
13. In the **Destination** column, replace the value with a period (".").
14. In the Manager navigation pane, select **Short Code**.
15. Add a short code to dial the trunk you have just added.
16. One end of the trunk is now configured. Save the configuration to the IP Office.
17. Using Manager, open the configuration for the IP Office at the other end of the SIP trunk and repeat the steps.

# SIP Line Requirements

Use of SIP requires the following:

- **SIP Service Account**

An account or accounts with a SIP internet service provider (ITSP). The method of operation and the information provided will vary. The key requirement is a SIP URI, a web address of the form **name@example.com**. This is the equivalent of a SIP telephone number for making and receiving calls via SIP.

- **Voice Compression Channels**

SIP calls use system voice compression channels in the same way as used for standard IP trunks and extensions. For an IP500 V2 system, these are provided by the installation of VCM modules within the control unit. RTP relay is applied to SIP calls where applicable.

- **Licensing**

SIP trunks require licenses in the system configuration. These set the maximum number of simultaneous SIP calls supported by the system.

- **Firewall Traversal**

Routing traditional H.323 VoIP calls through firewalls often fails due to the effects of NAT (Network Address Translation). For SIP a number of ways to ensure successful firewall traversal can be used. The system does not apply any firewall between LAN1 and LAN2 to SIP calls.

- **STUN (Simple Traverse of UDP NAT)**

UDP SIP can use a mechanism called STUN to cross firewalls between the switch and the ITSP. This requires the ITSP to provide the IP address of their STUN server and the system to then select from various STUN methods how to connect to that server. The system can attempt to auto-detect the required settings to successfully connect. To use STUN, the line must be linked to the Network Topology settings of a LAN interface using the line's Use Network Topology Info setting.

- **TURN (Traversal Using Relay NAT)**

TCP SIP can use a mechanism called TURN (Traversal Using Relay NAT). This is not currently supported.

- **Session Border Control**

STUN does not have to be used for NAT traversal when SBC is between IP Office and the ITSP, since the SBCE will be performing NAT traversal.

- **SIP Trunks**

These trunks are manually added to the system configuration. Typically a SIP trunk is required for each SIP ITSP being used. The configuration provides methods for multiple URI's from that ITSP to use the same trunk. For each trunk at least one SIP URI entry is required, up to 150 SIP URI's are supported on the same trunk. Amongst other things this sets the incoming and outgoing groups for call routing.

- **Outgoing Call Routing**

The initial routing uses any standard short code with a dial feature. The short code's Line Group ID should be set to match the Outgoing Group ID of the SIP URI channels to use. However the short code must also change the number dialed into a destination SIP URI

suitable for routing by the ITSP. In most cases, if the destination is a public telephone network number, a URI of the form **123456789@example.com** is suitable. For example:

- **Code:** 9N#
- **Feature:** Dial
- **Telephone Number:** N"@example.com"
- **Line Group ID:** 100

While this can be done in the short code, it is not an absolute necessity. The ITSP Proxy Address or ITSP Domain Name will be used as the host/domain part.

#### • Incoming Call Routing

Incoming SIP calls are routed in the same way as other incoming external calls. The caller and called information in the SIP call header can be used to match Incoming CLI and Incoming Number settings in normal system Incoming Call Route records.

#### • DiffServ Marking

DiffServ marking is applied to calls using the DiffServ Settings on the **System > LAN > VoIP** tab of the LAN interface as set by the line's **Use Network Topology Info** setting.

### SIP URIs

Calls across SIP require URI's (Uniform Resource Identifiers), one for the source and one for the destination. Each SIP URI consists of two parts, the user part (for example **name**) and the domain part (for example **example.com**) to form a full URI (in this case **name@example.com**). SIP URI's can take several forms:

- name@117.53.22.2
- name@example.com
- 012345678@example.com

Typically each account with a SIP service provider will include a SIP URI or a set of URI's. The domain part is then used for the SIP trunk configured for routing calls to that provider. The user part can be assigned either to an individual user if you have one URI per user for that ITSP, or it can also be configured against the line for use by all users who have calls routed via that line.

### Resource Limitation

A number of limits can affect the number of SIP calls. When one of these limits is reached the following occurs: any further outgoing SIP calls are blocked unless some alternate route is available using ARS; any incoming SIP calls are queued until the required resource becomes available. Limiting factors are:

- the number of licensed SIP sessions.
- the number of SIP sessions configured for a SIP URI.
- the number of voice compression channels.
  - **SIP Line Call to/from Non-IP Devices** Voice compression channel required.
  - **Outgoing SIP Line Call from IP Device** No voice compression channel required.
  - **Incoming SIP Line Call to IP Device** If using the same codec, voice compression channel reserved until call connected. If using differing codecs then 2 channels used.

## SIP Information Display

The full `from` and `to` SIP URI will be recorded for use by SMDR. For all other applications and for telephone devices, the SIP URI is put through system directory matching the same as for incoming CLI matching. First a match against the full URI is attempted, then a match against the user part of the URI. Directory wildcards can also be used for the URI matching.

# Chapter 95: SIP Headers and URIs

During SIP calls, various request and response messages are exchanged (see [Request methods](#) on page 974 and [Response methods](#) on page 975). For example, a SIP call is started by the caller sending an `INVITE` request to which `180 Ringing` and `200 OK` responses are expected.

These request and response messages contain various 'headers' detailing different information values, see [Headers](#) on page 975. Some of these headers contain contact information in the form of SIP URIs (Uniform Resource Identifier). For example; the caller, the original destination, the current destination, and so on.

## Related links

- [SIP URI Formats](#) on page 933
- [Standard SIP Headers](#) on page 934
- [Setting the SIP URI Host](#) on page 934
- [Setting the SIP URI Content](#) on page 935
- [Selecting the SIP Header Format Used](#) on page 937

---

## SIP URI Formats

When a header contains contact information, it is typically added using the 'SIP URI' format:

- A SIP URI is like an email address. In its simplest form, it appear as `sip:content@hostname`.
- The SIP URI can also indicate the target port: `sip:content@hostname:port`
- For some headers, the SIP URI can also include preferred display name. When that happens, the `sip:` part is enclosed in `< >` brackets. For example: `display <sip:content@hostname>`.
  - From the caller name, the line's **Name Priority** setting sets whether this name is displayed on internal phones or replaced by a name match from the system or user directories.
- Some line providers may use a different format called `TEL URI`. That takes the form `tel:123456789`.
- The system can use SIPS format which replaces `sip:` with `sips:.` This is used to indicate that the connection should use TLS from end to end. That is, every hop should use TLS.

The header format used by each SIP line in the system configuration is set by its URI Type setting. See [Selecting the SIP Header Format Used](#) on page 937.

**Related links**

[SIP Headers and URIs](#) on page 933

---

## Standard SIP Headers

Most request messages exchanged during SIP calls include the following headers:

| Header              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Request-URI         | <p>Also known as <code>Request-Line-URI</code> or <code>R-URI</code>. The first line of the request message indicates the destination for routing the message.</p> <p>If the message is routed through multiple hops, this header changes each time to indicate the next destination. Similarly, if the call is redirected, the header is changed to show the new destination.</p>                                                                                |
| Via                 | Every intermediate proxy that has been involved in the routing of the request is included as a SIP URI. These are used in reverse order to process response messages.                                                                                                                                                                                                                                                                                             |
| To                  | <p>This header indicates the original intended call target. It contains a SIP URI and can include a display name.</p> <ul style="list-style-type: none"> <li>On outgoing calls, the identity of the called party is not known at the time of the initial <code>INVITE</code>. Therefore the <code>To:</code> field only contains the information necessary to route the call. That is, the dialed digits after any short code and prefix manipulation.</li> </ul> |
| From                | This header indicates the identity of the caller. It contains a SIP URI and can include a display name.                                                                                                                                                                                                                                                                                                                                                           |
| Contact             | <p>This header indicates the return address for responses to the call request. This is a SIP URI.</p> <p>The SIP URI is similar to the <code>From</code> header. However, if anonymous calling is enabled, the field becomes semi-anonymous. For example; <code>Contact: &lt;sip:anonymous@135.55.86.70:5060;transport=udp&gt;</code></p>                                                                                                                         |
| P-Asserted-Identity | The SIP URI is similar to the <code>From</code> header. The field is unchanged even if anonymous calling is enabled.                                                                                                                                                                                                                                                                                                                                              |

## Setting the SIP URI Host

When the system needs to send a SIP URI in a header, the information used for the `@host` part of SIP URI is taken from the following settings (listed in order of priority, starting with the highest):

| Source/Setting            | Descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Short Code</b>         | <p>Short codes used to route calls to a SIP line can specify the host for the calls <b>To</b> and <b>R-URI</b> headers.</p> <ul style="list-style-type: none"> <li>• This is done in the short code's <b>Telephone Number</b> field by adding the host as a quoted suffix. For example, <code>N"@example.com"</code>.</li> <li>• The value must be enclosed in " " quotation marks to prevent any part being interpreted as short code wildcard characters.</li> </ul> |
| <b>Local Domain Name</b>  | If set, this setting is used for the host part the <b>From</b> , <b>Contact</b> and <b>Diversion</b> headers sent by the system, overriding the <b>ITSP Domain Name</b> below. It is also used for the <b>PAI</b> header if <b>Use Domain for PAI</b> is selected on the SIP line.                                                                                                                                                                                     |
| <b>ITSP Domain Name</b>   | If set, this setting is used for the host part of the <b>From</b> , <b>To</b> , <b>Diversion</b> and <b>R-URI</b> headers sent by the system.                                                                                                                                                                                                                                                                                                                          |
| <b>ITSP Proxy Address</b> | This setting is used for the host part of most headers sent by the system if none of the values above are set. However, if several addresses are set here, then either the <b>ITSP Domain Name</b> and/or <b>Local Domain Name</b> settings must be used.                                                                                                                                                                                                              |

## Setting the SIP URI Content

Each SIP line in the system has a **Call Details** form which can contains SIP URI entries. They set which headers are used and how the header data is populated or the values against which headers are matched.

Every incoming and outgoing call which uses the line is matched to one of these.

### Display

As above, the line URI associated with the call also sets the display name source for any headers that require it, for example the **From** and **To** headers.

| Setting     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Auto</b> | <p>The system automatically determines the appropriate value to use. It will use external numbers if forwarding incoming calls, and internal numbers for calls made by a local user.</p> <ul style="list-style-type: none"> <li>• On incoming calls, if the <b>Local URI</b> is set to <b>Auto</b>, the system looks for matches against extension numbers and system short codes.</li> <li>• On outgoing calls, it allows short code manipulation of the caller number and name. For example: <b>S</b> to explicitly set the caller number, <b>W</b> to set withheld, <b>A</b> to allow (override any previous withhold setting), <b>Z</b> to set the caller name.</li> </ul> |

*Table continues...*

| Setting                        | Description                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use Internal Data</b>       | Use the SIP settings of the user ( <b>User &gt; SIP</b> ), group ( <b>Group &gt; SIP</b> ) or voicemail services ( <b>System &gt; Voicemail &gt; SIP</b> ) making or receiving the call: <ul style="list-style-type: none"> <li>• Use the <b>SIP Display Name (Alias)</b> setting.</li> <li>• If the Anonymous is selected, use that value instead.</li> </ul> |
| <b>Manual Entry (Explicit)</b> | If required, you can type in a value. This is only used for fields configured as <b>Explicit</b> . This is typically used to set the DDI to be associated with SIP line appearances.                                                                                                                                                                           |
| <b>Credential Values</b>       | If a set of SIP Credentials has been selected in the URI settings, then the <b>User name</b> , <b>Authentication Name</b> or <b>Contact</b> values from the SIP credentials can be selected as values.                                                                                                                                                         |

## Content

On both incoming and outgoing SIP calls, the system associates one of the SIP line's URI entries with the call. The settings of that URI specify how the system should populate and use the `content` part of the SIP URI in various header. The possible settings are:

| Setting                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Auto</b>              | If <b>Auto</b> is selected, the system automatically determines the appropriate value to use. It uses external numbers when forwarding incoming calls, and internal extension numbers for calls made by a local user. <ul style="list-style-type: none"> <li>• On incoming calls, the system looks for matches against extension numbers and system short codes.</li> <li>• On outgoing calls, the system allows short code manipulation of the caller number and name. For example: <b>S</b> to explicitly set the caller number, <b>W</b> to set withheld, <b>A</b> to allow (override any previous withhold setting), <b>Z</b> to set the caller name.</li> </ul> |
| <b>Use Internal Data</b> | Use the SIP settings of the user ( <b>User &gt; SIP</b> ), group ( <b>Group &gt; SIP</b> ) or voicemail services ( <b>System &gt; Voicemail &gt; SIP</b> ) making or receiving the call: <ul style="list-style-type: none"> <li>• Use the <b>SIP Display Name (Alias)</b> setting.</li> <li>• If the Anonymous is selected, use that value instead.</li> </ul>                                                                                                                                                                                                                                                                                                       |
| <b>Manual Entry</b>      | If required, you can manually type in a value to use. The value is then used by other fields configured as <b>Explicit</b> . This is typically used to set the DDI to be associated with SIP line appearances.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Credential Values</b> | If a <b>Credentials</b> entry has been selected above, then the <b>User name</b> , <b>Authentication Name</b> and <b>Contact</b> values from the selected credentials entry can be selected as values. The value is then used by other fields configured as <b>Explicit</b> . <ul style="list-style-type: none"> <li>• URI values should only be set using credentials when required by the line provider. For example, some line providers require the <code>From</code> header to always contains the credentials used for registration, whilst other headers are used to convey information about the caller ID.</li> </ul>                                       |

## Selecting the SIP Header Format Used

The header format used by the system is set by the **SIP Line > URI Type** setting. This has the following options:

- **SIP** - Use `sip:` format SIP URIs.
- **Tel** - When selected, the system uses the Tel URI format, for example `tel: +1-816-555-1212`, in **To** headers.
- **SIPS** - When selected, the system replace the `sip:` part of the SIP URIs it sends with `sips:`. That indicates that TLS must be used for all stages of the call. To use this, the line's **Layer 4 Protocol** needs to be set to TLS.

[Typical outgoing call scenarios](#) on page 942

---

## SIP Outgoing Call Routing

When a user makes a call by dialing a number:

### 1. Dial Short Code Completed:

The dialing is processed through user, user rights, system and ARS short codes.

### 2. SIP Line URI/Line Appearance Matching:

The IP Office looks for a SIP URI with the same **Outgoing Group** as the short code's **Line Group ID**.

- a. Each line is checked in **Line Number** order.
- b. **SIP Line Appearance** entries are checked first, then **SIP URI** entries.
- c. Entries that have reached their **Max Sessions** or **Outgoing Sessions** are skipped.
- d. Once a match is found, it and the SIP line to which it belongs are used:
  - The line's **Call Initiation Timeout (s)** (default 4 seconds) sets how long the IP Office waits for a response to the attempt to initiate a call before following any alternate routes set in the ARS form.
  - The line's **Call Queuing Timeout (m)** (default 5 minutes) sets how long the IP Office waits for the call to be answered after receiving a provisional response.

### 3. No Available URI:

If all possible matches have reached their **Max Sessions** or **Outgoing Sessions** value:

- If the call was routed via an ARS short code, the ARS settings determine whether the call can be redirected to an alternate route.
- Otherwise, the call waits for a matching URI to become available ("Waiting for Line").

**Related links**

[Outgoing SIP Call Routing](#) on page 938

---

## Anonymous SIP Calls

Calls can be made and received with indication that the caller ID should be withheld. In SIP terminology, these are 'anonymous' calls.

 **Important:**

- Some line providers do not support the use of anonymous and will drop those calls. Others may require additional configuration in order to accept the use of anonymous status.

For outgoing calls, the call can be set as anonymous using the following methods:

- **W Short Code Character**

Adding a **W** as a suffix to the Telephone Number setting of a short code indicates withhold the caller ID. For SIP calls, this is supported if the line URI being used is set to **Auto**.

- **User/Group Anonymous Setting**

Each system user and hunt group has a set of SIP settings (**User > SIP**, **Group > SIP**, **System > Voicemail > SIP**). If selected, the **Anonymous** setting indicates that the user or group should be treated as anonymous when making/receiving SIP calls. The voicemail service also has SIP settings that include the option to be anonymous. For SIP calls, this is supported if the line URI used is set to **Use Internal Data**.

- **Withhold Number Option**

Avaya feature phones can be configured to withhold the caller ID (**Features > Call Settings > Withhold Number**). That matches the **W** short code operation above.

### How Does Setting a Call as Anonymous Affect the Call Headers?

Setting anonymous/caller ID withheld has the following effect on the information added to SIP URIs sent by the system:

- The system adds a `Privacy` header to the call information.
- If **Send From In Clear** is not enabled (the default):
  - The SIP URI in the From header is anonymized:
    - The display name part is set to "Anonymous".
    - The content and host parts are set to dummy values (`anonymous@anonymous.invalid`).
  - The `Privacy` header is set to user, otherwise it is set to id.
  - A `PPI` or `PAI` header is used to contain the caller's number. This is done using the line's **Use PAI for Privacy** setting (off and so `PPI` is used by default). `PAI` headers should only be used in a trusted network.

- If **Send From In Clear** is enabled:
  - The `From` header is not anonymized,
- When used in SIP URI and SIP Line Appearances, the **P Preferred ID** or **P Asserted ID** entries should be configured to be the same or only one of them should be configured.

## SIP ARS Response Codes

Through SIP RFC3398, many of the response codes used for SIP calls are translations of ISDN codes. For outgoing calls, these can affect the routing through ARS as follows:

### Do Not Use This Line Group

The following response codes will cause the system's ARS to no longer target the particular outgoing line group. It depends on other settings whether the ARS attempts to target the call to a different line group or escalate it to another ARS entry.

| Code | Cause Code                                                           |
|------|----------------------------------------------------------------------|
| 1    | Unallocated Number.                                                  |
| 2    | No route to specific transit network/(5ESS) Calling party off hold.  |
| 3    | No route to destination./(5ESS) Calling party dropped while on hold. |
| 4    | Send special information tone/(NI-2) Vacant Code.                    |
| 5    | Misdialed trunk prefix.                                              |
| 8    | Preemption/(NI-2) Prefix 0 dialed in error.                          |
| 9    | Preemption, cct reserved/ (NI-2) Prefix 1 dialed in error.           |
| 10   | (NI-2) Prefix 1 not dialed.                                          |
| 11   | (NI-2) Excessive digits received call proceeding.                    |
| 22   | Number Changed.                                                      |

| 127  | Interworking Unspecified.                                           |

### Stop ARS

The following response codes end the outgoing call routing and any further ARS targeting of the call.

| Code | Cause Code                |
|------|---------------------------|
| 17   | Busy.                     |
| 21   | Call Rejected.            |
| 27   | Destination Out of Order. |

### No Affect

All other cause codes do not affect ARS operation.

## SIP Short Codes

Outgoing SIP calls are largely processed through short codes in the same way as for other line types. The following specific notes apply:

| Note                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>En-Bloc Dialing is Required</b> | <p>SIP Lines do not use overlap dialing. They expect to receive the full destination number, called 'en-bloc' dialing.</p> <ul style="list-style-type: none"><li>• The short code used to route calls to a SIP Line should use a ; (semi-colon) character at the end of the short code field. That character instructs the system to wait for dialing to be completed before using the short code.</li><li>• Dialing complete is indicated by either:<ul style="list-style-type: none"><li>- the dialer pressing #</li><li>- the device or application being used sending a dialing complete signal.</li><li>- the IP Office's <b>Dial Delay Time</b> expiring. The default is 4 seconds.</li></ul></li></ul> |
| <b>Caller ID Characters</b>        | <p>For SIP URIs configured to <b>Auto</b> (the default), the short code <b>Telephone Number</b> field characters used to control the sending of the caller ID number are supported. Those characters are <b>A</b>, <b>W</b>, <b>S</b> and <b>SS</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Host ID</b>                     | <p>Short codes used to route the call to a SIP line can specify the host to be used for <b>To</b> and <b>R-URI</b> headers. This is done in the short code's <b>Telephone Number</b> field by adding the host as a quoted suffix.</p> <p>For example, <code>N"@example.com"</code>. The value must be enclosed in " " quotation marks in order to prevent its characters being interpreted as short code wildcards.</p>                                                                                                                                                                                                                                                                                       |

# SIP Incoming Call Routing

When the IP Office receives a SIP call, it determines the routing of the call as follows:

## 1. Line Matching:

The incoming SIP call is matched to a SIP line. If no match is found, the call is ignored. SIP line matching is done in two stages:

### a. Protocol Matching:

The call is matched with lines configured with the same protocol (UDP, TCP or TLS) and listening port settings.

### b. Line Association:

If there are several possible line matches, they are checked in **Line Number** order, for a match between the incoming call's source and each line's **Association Method** setting.

## 2. Line Call Details Matching:

Using the line's **Call Routing Method**, either the **To** or **Request-URI** of the incoming SIP request is used to find a matching **Local URI**.

- The IP Office first looks for a matching **SIP Line Appearances**. If a match is found, the call is associated with the first available line appearance number in the **Incoming ID** order setting.
- If no **SIP Line Appearances** match is found, the IP Office checks the line's **SIP URIs** in their URI number order.
- Entries at their **Max Session** or **Incoming Sessions** values are ignored.
- When an match is found, its **Incoming Group ID** setting is used for incoming call route matching. For **SIP Line Appearances**, this is in addition to altering on matching line appearance buttons.
- If no match is found, the IP Office uses its **Service Busy Response** setting (`486 Busy here` or `503 Service Unavailable`) to end the call.

## 3. Incoming Call Route matching:

The IP Office's incoming call route entries are checked for a match.

### a. The matching uses the following options in order:

#### a. Line Group Match:

Only incoming call routes with a **Line Group ID** setting that matches the SIP lines appearance/SIP URI's **Incoming Group ID** setting are checked.

#### b. Incoming Number Match:

The IP Office looks for call routes with a match between their **Incoming Number** setting and the **Local URI** value received. There is always a received number

value with incoming SIP calls, so always a potentially incoming number matching value.

- Incoming calls routes with a blank **Incoming Number** field match any incoming number.
- If the incoming call route's **Destination** is set to . (period), the **Local URI** received is used to look for destination matches.
  - If set to **Auto**, the IP Office looks for a matching extension number or system short code.
  - If set to **Use Internal Data**, the system looks for a match against the **SIP Name** of users and then groups.

#### c. Incoming CLI Match

From the possible matches, the IP Office looks for a match between the each route's **Incoming CLI**, if set, and the caller details in the `From` header. For `SIP URI` and `TEL URI` headers, partial matching starting from the left is supported. For IP addresses, only exact matches are supported.

- b. If the call matches more than one incoming call route:
  - a. The most precise match is used. For example, the highest number of matching criteria and highest number of exact digit rather than wildcard character matches.
  - b. If the call stills matches more than one incoming call route, the one added to the configuration first is used.
- c. If there is no match:
  - a. For calls using a line's SIP URI entry with its **Local URI** set to **Auto**, the incoming number is checked for a direct match to an internal extension number.
  - b. Otherwise, busy indication is sent to the caller and the call is dropped.

#### 4. Incoming Call Route Match:

Once a match is resolved, this determines the incoming call route's current destination:

- a. Each incoming route can include multiple pairs of main and fallback destinations.
- b. Apart from the default pair, each pair uses an associated time profile. The time profile defines when that destination pair should be used.
  - a. With multiple destination pairs, the entry used is the first, working from bottom up, whose time profile is currently 'true'. If no match occurs, the **Default Value** options are used.
  - b. The system attempts to present the call to the destination. If the destination is busy, it presents the call to the fallback extension.

#### 5. Call Presentation:

The call is presented to the destination. If the call was routed via a **SIP Line Appearance**, the call also alerts on any matching **Line Appearance** buttons.

## SIP Prefix Operation

The SIP line settings include settings for **Prefix**, **National Prefix**, **Country Code** and **International Prefix** values. These values are used in the following order:

1. If the number starts with a + symbol, the symbol is replaced with the **International Prefix**.
2. If the **Country Code** has been set:
  - a. If the number begins with the **Country Code**, or **International Prefix** plus **Country Code**, the IP Office replaces them with the **National Prefix**.
  - b. If the number does not start with the **National Prefix** or **International Prefix**, the IP Office adds the **International Prefix**.
3. If the incoming number does not begin with the **National Prefix** or **International Prefix**, the IP Office adds the **Prefix**.

### Examples

For example, if the SIP Line is configured with prefixes as follows:

- **Prefix:** 9 - The external dialing prefix used to make outgoing external calls.
- **National Prefix:** 90 - The expected prefix for outgoing national calls, including the external dialing prefix.
- **International Prefix:** 900 - The expected prefix for outgoing international calls, including the external dialing prefix.
- **Country Code:** 44 - The local country code.

| Number Received | Processing                                                                                                                                                                                                                              | Resulting Number |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| +441707362200   | Following rule 1, the + is replace with the <b>International Prefix</b> .<br><br>The number now matches the <b>International Prefix</b> and <b>Country Code</b> . Following rule 2a, they are replace with the <b>National Prefix</b> . | 901707362200     |
| 00441707362200  | Following rule 2a, the <b>International Prefix</b> and the <b>Country Code</b> are replaced with the <b>National Prefix</b> .                                                                                                           | 90107362200      |
| 441707362200    | Following rule 2a, the <b>Country Code</b> is replace with the <b>National Prefix</b> .                                                                                                                                                 | 901707362200     |
| 6494770557      | Following rule 3, the <b>International Prefix</b> (900) is added.                                                                                                                                                                       | 9006494770557    |

[Incoming SIP Call Routing](#) on page 945

## Media path connection

IP Office does not provide in-band ringback to incoming SIP trunk calls. The only normal scenario in which an incoming SIP trunk call hears in-band ringback occurs when the call terminates on an

analog trunk. With analog trunks, the media path is cut through immediately because IP Office has no way of determining the state (ringing, busy, answered) of the trunk.

IP Office can connect “early” media before the call is answered by sending a 183 *Session Progress* response. This is only done when the following two conditions are met:

- A *PROGRESS* (in-band tone indication or 183 *Session Progress* with SDP) message is received from the destination. This can only happen in a SIP-to-PRI or SIP-to-SIP tandem call scenario.
- The *INVITE* message contains SDP.
  - IP Office does not attempt to connect early media on *PROGRESS* when there is no SDP in the initial *INVITE*, since this is unlikely to succeed. The likely reason there is no SDP in the *INVITE* is probably that the originating system does not know the originator's media address yet. A typical scenario where this is the case occurs when the call on the originating system comes from an H.323 SlowStart trunk.

#### Related links

[Incoming SIP Call Routing](#) on page 945

## SIP Caller Name and Number Display

For incoming SIP calls, the caller name and number are obtained from the following headers:

| Value                | Description                                                                                                                                                                                                                                                                                                              |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Caller Name</b>   | Unless withheld (see notes below), the caller number for incoming calls is taken from <i>PAI</i> header if present, otherwise from the <i>From</i> header. The SIP line's advanced settings <b>Caller ID FROM Header</b> option can be used to force use of the <i>FROM</i> header only.                                 |
| <b>Caller Number</b> | The caller name for incoming calls is taken from the name supplied with the following headers, in order of priority with highest first: <ol style="list-style-type: none"> <li>1. <i>PPI</i> header</li> <li>2. <i>PAI</i> header</li> <li>3. <i>Remote Party ID</i> header</li> <li>4. <i>Contact</i> header</li> </ol> |

#### Notes

1. The above apply regardless of the header settings of the SIP URI handling the incoming call. For example, for incoming caller details, you do not need to have **P Preferred ID** selected and configured in the SIP URI or SIP line appearance. The *PPI* header info is used if present in the incoming request.
2. If the receiving IP Office system has **Caller ID from From** header enabled (disabled by default), then the *From* header name is used regardless of *PAI* or *PPI* headers.
3. If the header to be used for the caller's name does not contain a name, “Unknown” is displayed.

4. Calls from a source that is anonymous display "Withheld" as the caller name and no number.

[Incoming SIP Call Routing](#) on page 945

## Typical incoming call scenarios

### INVITE with SDP, local ringback

If the destination is an analog trunk, the 180 Ringing will be replaced with a 183 Progress with SDP followed immediately by a “fake” answer in order that the media will be connected right away so that the originator hears whatever in-band tones are present on the analog trunk (ringback or busy). If the target is an extension that is unconditionally call forwarded over an analog trunk, then there will be a 180 Ringing without SDP, followed immediately by the “fake” answer.

### INVITE with SDP, early media

If the SIP Trunk receives a FAR\_PROGRESS (in-band) message from its peer in the core (e.g. from a tandem PRI or SIP trunk), it sends a 183 Session Progress message with SDP to the far end. IP Office will connect the media on receipt of 180 or 183 with SDP.

### INVITE without SDP, local ring back

IP Office does not attempt to send early media in this scenario.

### INVITE without SDP, early media

In this scenario, the far end attempts to connect media before the call is answered. IP Office does not provide early media when receiving an empty INVITE, but rather 180 Ringing instead. There is

no requirement to provide an SDP in the 180 Ringing provisional response, as that response is not sent reliably using the PRACK mechanism.

### INVITE without SDP, call terminates on H.323 endpoint

If the destination of the call is an H.323 trunk, the destination media address is not known when the call is answered. Therefore, the SDP offer in 200 OK will contain a null port number (and IP address). Once the logical channels are opened on the H.323 side, IP Office sends a re-INVITE using the real media address.

# Chapter 98: SIP messaging

## SIP trunk prerequisites

Before any calls can be made, the system must have sufficient SIP trunk licenses for the maximum number of simultaneous SIP trunk calls expected.

On Server Edition systems, the **System | Telephony | Telephony | Maximum SIP Sessions** value must match the total number of SIP extension and trunk calls that can occur at the same time.

## Codec selection

### Normal Codec Selection

Codec selection is based on the Offer/Answer model specified in RFC 3264.

1. The calling endpoint issues an offer that includes a list of the codecs it supports.
  - For IP Office SIP trunks, the IP Office offers the codecs set on the SIP trunks **VoIP** tab. It does not offer those set on the extension.
2. The called endpoint sends an answer that normally contains a single codec from the offered list.
  - If there are multiple codecs in the answer, IP Office only considers the first codec. If the SIP Line is configured to do **Codec Lockdown**, it will send another `INVITE` with the single chosen codec.

### Codec Changes with reINVITE

For R11.0 and higher, the IP Office supports codec selection following a `reINVITE`. Previously, when a `reINVITE` was received during a call, if the `reINVITE` contained the codec currently in

use, that codec was preferred and kept. For R11.0 and higher, the IP Office reevaluates the codec to use based on any preferences included in the `reINVITE`:

- For example, if the endpoint/trunk has a different codec preference to the system, hold/unhold sequences will result in codec changes. When held, the system codec preference is used to play music-on-hold. When unheld, the codec preferences are reevaluated.

When using this behavior:

- Direct media is supported for SRTP phones that change keys on each `reINVITE`.
- The IP Office supports the transfer of video calls.

Note:

- The new behavior also applies to SM lines and SIP extensions.
- On IP Office systems upgraded to R11.0 and higher, `SLIC_PREFER_EXISTING_CODEC` is automatically added to the **SIP Engineering** tab of any existing SIP lines to retain the existing pre-R11.0 behavior.

## SIP DTMF Transmission

DTMF key presses can be transmitted either in-band as audio tones or signaled using DTMF over RTP (RFC 2833)

When using DTMF over RTP (RFC 2833), the IP Office supports asymmetric dynamic payload negotiation when it is necessary to bridge SIP endpoints that do not support payload negotiation. The value used for an initial offer is configured on the **System | Codecs** tab. The default value is 101. Upon receipt of an offer with an RFC2833 payload type, IP Office automatically uses the proposed value rather than its own configured value. This helps to support networks that do not negotiate payload types.

### Direct Media Calls

There are cases in which direct media is desirable between SIP trunks and endpoints that do not support RFC2833. To allow for this, if a key presses is indicate from the extension, the IP Office temporarily switches the call back to indirect media. It then injects the digits in-band using the negotiated dynamic payload and, after fifteen seconds of no further key presses, the call is switched back to direct media.

## Fax over SIP

T.38 Fax over SIP is supported on the IP500 V2 platform deployed as standalone or as an expansion gateway. G.711 fax is also supported, and is supported on Linux servers. For networks that do or do not support T.38, IP Office allows both G3 and Super G3 fax machines to interoperate.

There are configuration parameters that control the behavior in different networks. If T.38 is supported in a network, then it may make sense to select T.38 as the Fax Transport preference in order to make use the inherent quality provided by the redundancy mechanisms. On the other hand, if all of the fax machines in the network are Super G3 capable, there may be a need to take advantage of the increased speed that this encoding provides. Since T.38 is not capable of encoding Super G3, G.711 may be a better choice for the Fax Transport. In either case, IP Office will accept codec change requests from the far SIP endpoint to switch to T.38 or to G.711.

T.38 Fax Transport and Direct Media are mutually exclusive on a given SIP Line. IP Office keeps itself in the media path so that it can detect fax tones to make the switch to T.38.

---

## SIP Call Hold Scenarios

### Hold originated by IP Office

When an IP Office DS extension or non-IP trunk puts a SIP trunk on hold, there is no indication to the network. The voice path is merely switched in the TDM domain to the appropriate hold treatment source (tones, silence or music).

For IP extensions and trunks, be they H.323 or SIP, if the call uses direct media, there will be a re-INVITE sent to redirect the media source from the extension or trunk endpoint to a port on the IP Office in order to connect hold treatment. When the call is then unheld, another `INVITE` will go out to connect the extension with the far end.

### Hold originated by far end

The far end of a SIP trunk can put the IP Office call on hold by sending it an re-INVITE with an SDP Offer containing:

- A **sendonly** attribute. IP Office replies with an SDP Answer containing the **recvonly** attribute.
- An **inactive** attribute. IP Office replies with **inactive**.
- A zero media connection address (c=0.0.0.0). IP Office replies with **inactive**.

### Unhold

A held call is unheld by means of an SDP Offer with the **sendrecv** attribute (or no direction attribute, since **sendrecv** is assumed if not specified).

### Unhold from mutual hold

Either end can unhold the other end by sending a new Offer with the **sendrecv** or **recvonly** attribute. The other end replies with **sendonly** if the call is still on hold at its end.

## SIP Call Transfers (Refer)

After a SIP call has been established, the `SIP REFER` method is used by the transferor end of the call to transfer the transferee end to a the transfer target. The `REFER` message provides the transfer target's contact information in a `Refer-To` header. That information is used to establish complete the transfer.

For public SIP trunks, IP Office supports only consultative call transfer using `REFER`. Consultative transfers are also known as attended or supervised transfers. With consultative transfer, the transferor puts the first call on hold and establishes a consultation call to the transfer target. After the consultation call, the transferor completes the transfer, causing the transferee to connect to the transfer target, replacing the transferor.

`REFER` can be configured to accept incoming, reject incoming, or decide based on the presence of `REFER` in the **Allow:** header in responses to `OPTIONS` messages. Similarly, there is the same configuration for outgoing `REFER`.

Although the transferor and transferee must be SIP endpoints, the transfer target can be a TDM, PRI, H.323 or SIP terminal on the same IP Office, or an endpoint reachable over the same SIP line as the `REFER` request is received from.

[SIP messaging](#) on page 954

## Ringback Tone

The ringback tone behavior of IP Office systems has changed for IP Office R11.0 and higher.

After sending an `INVITE` request, if the IP Office receives an `18X` response with SDP, it starts playing remote ringback tone. Prior to R11.0, if it then receives an `18X` response without SDP, the IP Office would continue playing remote ringback tone. For R11.0 and higher, following the `18X` without SDP, the IP Office now switches to local ringback tone.

In summary:

1. The IP Office sends an `INVITE`.
2. The IP Office receives `18X` with SDP. The IP Office plays remote ringback tone.
3. The IP Office receives `18X` without SDP:
  - **Pre-R11.0:** Continue playing remote ringback tone.
  - **R11.0+:** Switch to playing local ringback tone.

This feature is supported regardless of whether provisional response reliability (PRACK/100rel) is enabled or not.

When SIP call signaling transitions from remote to local ringback, the IP Office hosting the SIP trunk play the local ringback tone to the other end (phone or trunk).

### Ringback Tone with Early Media

A special case applies for SIP trunks configured to use `p-early-media`. For `18x` responses with or without SDP to be considered, a `p-early-media` header must be present in the response. If otherwise, the message is not considered with regards to early media (the system continues playing either local ringback or remote early media).

**For example:** The IP Office receives a `183` response with SDP and a `p-early-media` header with a `sendonly` or `sendrecv` parameter. The IP Office then receives a `183` response (with or without SDP):

- **Example 1:** If the response does not include a `p-early-media` header, the IP Office continues listening to the remote early media.
- **Example2:** If the response includes a `p-early-media` header with an `inactive` parameter, the IP Office switches to playing local ringback tone.

## Hold Reminders

For IP Office R11.0 and higher:

- For SIP phones, the IP Office only provides hold reminders to Avaya SIP phones.
- If the user is on the video call, there will be no reminder call.
- The IP Office supports direct media when using SRTP with 1100, 1200, J129, E129, B179 and H175.

---

## SIP Line Appearance Incoming Call Routing

The routing of incoming SIP calls, including SIP line appearances, is covered in [SIP Incoming Call Routing](#) on page 946. However, the following key points should be observed:

- Call matching to an incoming call route destination (or an extension match to the **Local URI** value) is still required. The call is rejected if that does not occur.
  - This is necessary to associate the call with a user or group whose settings (for example forwarding and voicemail) it follows until answered.
  - If the incoming call route destination is a user with a matching line appearance button for the call, then the additional private line features for a line appearance call are applied. See [Line Appearance Buttons](#) on page 1219.
- As normal, if the call is answered by the voicemail service, whilst it is indicated on line appearance buttons, they cannot be used to answer or bridge into the call.

## SIP Line Appearance User Button Programming

Line appearances buttons for SIP line appearances are programmed in the same way as for any type of line appearance. However, the following additional requirement applies:

- Users with line appearance buttons for a particular SIP Line appearance entry must be assigned buttons for all line appearance numbers allocated to that entry. By default that is 3 line appearance numbers.

**Related links**

[SIP Line Appearances](#) on page 961

# Chapter 100: SIP Calling Number Verification (STIR/SHAKEN)

Calling number verification is a SIP feature where the calling number is verified by the ISP and the results of that verification is included with the incoming call. The aim of this is to help reduce call spoofing.

- Support for and use of SIP calling number verification is mandated by law for US/Canadian locales. However, the feature can be enabled in any locale if supported by the local SIP ISP.
- This feature only does calling number verification. The display name information supplied with calls is not verified.

Verification is done by the ITSP by looking at several factors:

- Is the calling number associated with the subscriber making the call?
- Is the call coming from a known customer?
- Is the call originated by the known ITSP?
- Was the call digitally signed and was the ITSP able to fetch the public certificate of the originating service provider in order to verify that the `SIP INVITE` has not be changed during transit.

The result of the verification process is then indicated in the call's headers using a `verstat` value:

- `TN-Validation-Passed` plus an attestation level (see the table below). For example, `TN-Validation-Passed-A`.
- `TN-Validation-Failed` plus an attestation level (see the table below). For example, `TN-Validation-Failed-A`.
- `No-TN-Validation -`

The attestation levels are:

| Attestation Level |                  | Description                                                                                                                                                                                                                                                                   |
|-------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A                 | Full Attestation | The customer is known and the calling number is one associated with that customer. <ul style="list-style-type: none"><li>• Note that for calls where no authentication level is indicated or can be obtained, the IP Office treats the call as attestation level A.</li></ul> |

*Table continues...*

| Attestation Level |                            | Description                                                                                                                                                                                                                                                                                                                                               |
|-------------------|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>B</b>          | <b>Partial Attestation</b> | <p>The customer is known. However, the number not one associated with that customer. For example:</p> <ul style="list-style-type: none"> <li>the customer is forwarding a call from with a original calling number that is not associated with them.</li> <li>the call is originating from another known ITSP. Common for international calls.</li> </ul> |
| <b>C</b>          | <b>Gateway Attestation</b> | The call has come via a trusted source, but the original customer and number are not known.                                                                                                                                                                                                                                                               |

When calling number verification is available, the IP Office system can use the results to determine how to handle calls.

- Use of calling number verification is enabled on a per line basis.
- On lines where it is enabled, the line can either use the system default settings or line specific settings
- The settings determine whether a call should accepted or not.
  - If not accepted, the call is rejected by the system with a 666 response code.
  - If accepted, the call is routed as normal by features such as **Incoming Call Route** matching. However, if required, the specific result of the calling number verification can be used to vary the routing.
- The attestation level is included in the call's SMDR record. That includes rejected calls.

---

## The STIR/SHAKEN SIP Protocols

Calling number verification is implemented by ITSPs using a number of SIP RFCs, collectively referred to as STIR/SHAKEN.

- **STIR** (*Secure Telephony Identity Revisited*)
  - This protocol uses digital certificates between the customer (the call originator) and the ITSP to establish customer authentication. The ISP can then examine known numbers allocated to that customer for number authentication.

- **SHAKEN** (*Signature-base Handling of Asserted information using toKENs*)
  - These are guidelines for PSTN network providers handling calls which transit from the non-SIP PSTN to SIP networks. Currently, it has mainly been implemented as a service for SS7 carriers in USA and Canada.

For more details, refer to <https://en.wikipedia.org/wiki/STIR/SHAKEN>.

[SIP Calling Number Verification \(STIR/SHAKEN\)](#) on page 963

---

## Obtaining a call's number verification result

The methods implemented by different ITSPs to send a call's number verification can vary. The method used by IP Office to obtain the result is as follows:

- The IP Office looks for a `verstat` parameter in the `tel` or `sip uri` included in the call's **From** or **PAI** header. If both are present, preference is given to the **PAI** header. For example:
  - PAI: `tel:+123456789;verstat=TN-Validation-Passed-A`
  - PAI: `sip:+123456789;verstat=TN-Validation-Passed-A@foo.com;user=phone`
- The `verstat` parameter is used even if associated with an anonymous `sip/sips` URI.
- If there are multiple **PAI** headers with `verstat` information, only the first one is used.
- The attestation level is taken from the `verstat` parameter if it contains one of the recognized authentication levels A, B and C.
- If the `verstat` parameter is not available, the IP Office checks whether the level is available in any other headers such as **Attestation-Info** (used by ASBCE) or **X-Attestation-Info** (used by Verizon).
- The checking of further headers can also be enabled. See [Changing the authentication header used](#) on page 969.
- If no header provides an attestation level, level A is assumed.

## Setting the system's number verification default behavior

This process sets the default behaviors applied by SIP lines on which calling number verification is enabled.

## Procedure

1. Access the **System > VoIP > VoIP Security** settings.
2. In the **Calling Number Verification** section, set the required behavior:

| Field                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Incoming Calls Handling</b> | <p>Default = <b>Allow Not Failed</b></p> <p>Sets the defaults for which calls are accepted by the system based on the authentication level of the call. This default can be overridden in the individual line configuration.</p> <ul style="list-style-type: none"> <li>• <b>Allow All</b> - Allow all calls regardless of calling number verification.</li> <li>• <b>Allow Validated</b> - Only accept verified calls with full or partial attestation.</li> <li>• <b>Allow Not Failed</b> - Accept all calls except those that specifically failed verification. Note this can include calls with no reported verification result.</li> </ul> |
| <b>Validation Presentation</b> | <p>Default = Off</p> <p>If enabled, the system will prefix the caller ID information displayed on phones with a character indicating the result of the call's validation result. This will be:</p> <ul style="list-style-type: none"> <li>• A tick mark for full verification.</li> <li>• A question mark for partial verification.</li> <li>• A cross for authentication failed.</li> </ul> <p>When enabled, the system will also inspect the display information on all received trunk calls to ensure they do not start with these characters in order to avoid spoofing.</p>                                                                |

3. Save the settings.

## Next steps

- Enable calling number validation on the individual SIP lines. See [Enabling calling number verification on a SIP line](#) on page 966.

---

## Enabling calling number verification on a SIP line

This process configures the SIP line specific settings for calling number verification.

## Procedure

1. Access the SIP line's settings and select the **SIP Advanced** tab.
2. In the **Calling Number Verification** section, set the required behavior:

| Field                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Calling Number Verification</b> | Default = Off<br>Sets whether the line uses calling number verification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Incoming Calls Handling</b>     | Default = <b>Allow Not Failed</b><br>Set which calls are accepted by the system based on the attestation level of the call.<br><ul style="list-style-type: none"> <li>• <b>System</b> - Use the default system setting (<b>System VoIP &gt; VoIP Security &gt; Calling Number Verification</b>).</li> <li>• <b>Allow All</b> - Allow all calls regardless of calling number verification.</li> <li>• <b>Allow Validated</b> - Only accept verified calls with full or partial attestation.</li> <li>• <b>Allow Not Failed</b> - Accept all calls except those that specifically failed verification. Note this can include calls with no reported verification result.</li> </ul> |

3. Save the changes.

[SIP Calling Number Verification \(STIR/SHAKEN\)](#) on page 963

## SIP Calling Number Verification (STIR/SHAKEN)

For calls with are allowed following calling number verification, normal incoming call routing is applied. However, that routing can be made to be specific to the verification result and attestation level of the call.

This is achieved using the following characters in the **Code** field of short codes or **Incoming CLI** field of incoming call routes:

| Character | Meaning        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>P</b>  | <b>Passed</b>  | Matches calls where the <code>verstat</code> value is set to <code>TN-Validation-Passed</code> plus the attestation level. For example, <code>TN-Validation-Passed-A</code> .<br><br>If required, the specific level of attestation to match can be specified. That is done by following the <b>P</b> character with the required level or levels inside " " marks. For example:<br><ul style="list-style-type: none"> <li>• <code>P"A"</code> matches calls with an attestation of A.</li> <li>• <code>P"B"</code> matches calls with an attestation of B.</li> <li>• <code>P"AB"</code> matches calls with an attestation of A or B.</li> </ul> |
| <b>F</b>  | <b>Failed</b>  | Matches calls that specifically failed verification. That is, the call's <code>verstat</code> value is set to <code>TN-Validation-Failed</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Q</b>  | <b>Unknown</b> | Matches calls which do not have any verification result or where the <code>verstat</code> value received is <code>No-TN-Validation</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Example Incoming Call Routing

In this example, the system has the following incoming call routes defined for calls to the business's main sales number. Apart from the setting below, each of the incoming call routes has the same settings and matches the incoming group ID used by the SIP trunks URI.

| Incoming Call Route | Incoming CLI | Destination    | Description                                                                                                                                                                                                                                                  |
|---------------------|--------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.                  | P"A"         | Hunt Group     | The business's sales hunt group.                                                                                                                                                                                                                             |
| 2.                  | <i>blank</i> | Auto-Attendant | The business's auto-attendant. The use of an auto-attendant to answer calls deflects automated calls with potential spoofed caller ID numbers but still allows callers to select to be connected to the sales group via the provided auto-attendant options. |
| 3.                  | P"B"         | Auto-Attendant |                                                                                                                                                                                                                                                              |
| 4.                  | Q            | Auto-Attendant |                                                                                                                                                                                                                                                              |
| 5.                  | F            | Barred         | A short code set to the barred feature.                                                                                                                                                                                                                      |

The following calls to the sales number are received:

| Incoming Call Details | Incoming CLI | Attestation Level | Destination                                                                                                                                                                |
|-----------------------|--------------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.                    | 111          | A                 | A fully validated call. The call details match the 2nd call route only. Therefore, the call is routed the sales hunt group.                                                |
| 2.                    | 222          | B                 | A partially validated call. The call details match both the 2nd and 3rd call routes. However, the 3rd match is more precise, so the call is routed to the auto-attendant.  |
| 3.                    | 333          | C                 | The call details match both the 2nd and 5th call routes. However, the 5th match is more precise, so the call is routed to the barred short code.                           |
| 4.                    | 444          | None              | A call with no attestation level. The call details match the 2nd and 4th call routes. However, the 3rd match is more precise, so the call is routed to the auto-attendant. |

## Calling Name Display

Calling number validation only validates the caller's number, not the display name information provided with the call.

---

## Changing the rejected call responses

For rejected calls, by default the rejection is done using the response code 666 and the string "Unwanted". However, if required by the ISP, a different code and/or string can be used, configured using the process below.

- Rejected calls are included in the system's SMDR and CDR outputs.
- Rejected calls are not included in the individual user's call logs and call histories.

### Procedure

1. Open the SIP line's settings and select **SIP Engineering**.
2. Click **Add** and enter one of the following custom strings:
  - To change the reject code, enter `SLIC_STIR_REJECT_CODE=N` where N is the response code number to use.
  - To change the reject string, enter `SLIC_STIR_REJECT_STRING=Y` where Y is the string to use.
3. Click **Create new**.
4. Save the settings.

---

## Changing the authentication header used

[Obtaining a call's number verification result](#) on page 965 describes the normal process by which the IP Office system normally obtains a call's verification result from its headers. However, if required, the IP Office can look for the `verstat` value in another specified header.

- As per normal operation, if `verstat` values are present in more than one header, only the first is used.

### Procedure

1. Open the SIP line's settings and select **SIP Engineering**.
2. Click **Add** and enter one of the following custom strings:
  - To specify the header to check, enter `SLIC_STIR_ATTEST="W"` where W is the name of the header used by the ITSP.
    - For example, `SLIC_STIR_ATTEST="X-StirResult"` instructs the IP Office to also check for a value in the `X-StirResult` header if present. .
3. Click **Create new**.

4. Save the settings.

## Customizing the call handling behavior

The behavior applied to calls can be customized. This is done on a per-line basis, using the decimal sum of a binary bit string, where bit 0 is least significant bit (right-to-left).

The custom behavior provided by each bit when enabled (set to 1) are:

| Bit | Attestation Level                  | Custom Behavior if bit set to 1 |
|-----|------------------------------------|---------------------------------|
| 0   | Attestation Passed Calls (A and B) | Retain the Caller ID display.   |
| 1   |                                    | Perform directory matching.     |
| 2   | No Attestation Calls (Assumed A)   | Retain the Caller ID display.   |
| 3   |                                    | Perform directory matching.     |
| 4   | Attestation Failed Calls (C)       | Retain the Caller ID display    |
| 5   |                                    | Perform directory matching.     |

**Procedure**

1. Open the SIP line's settings and select **SIP Engineering**.
2. Click **Add** and enter one of the following custom strings:
  - To change the reject code, enter `SLIC_STIR_CUSTOM=Z` where Z is the decimal sum of the binary bits.
    - For example, `SLIC_STIR_CUSTOM=15` retains the caller ID display and does directory matching for all calls except those that have attestation level C. That is, bits 0 to 3 all set to 1, bits 4 and 5 set to 0. The decimal sum of that bit string is 15.
3. Click **Create new**.
4. Save the settings.

---

## Call Records

The authentication level (A, B or C) provided by the ISP is included in the SMDR call logging records output by the system. If no authentication level is provided, N/A is shown instead.

An SMDR call record is produced even for calls which are rejected by the system based on the calling number verification settings.

### Additional Information

- The IP Office supports `Call-ID` headers of up to 256 characters.
- For IP Office R11.1 FP2 SP3 and higher, the maximum length of the `tag` element in `From` and `To` headers has increased to 150 characters (previously 80 characters).

# Part 13: Short Codes

# Chapter 102: Short Code Overview

Whenever the system receives a set of digits to process, if those digits do not match a user or group extension number, the system will look for a short code match. The matching short code then defines what action (short code feature) should be applied to the call, where it should be routed and which of the dialed digits, if any, should be used in the subsequent action.

This applies to digits dialed by a telephone user, sent by a user selecting a directory contact or speed dial, and in some cases to digits received with an incoming call on a line.

This section provides an overview of short codes configuration and use.

## **Warning:**

- The dialing of emergency numbers must not be blocked. Whenever short codes are edited, you must ensure that the ability of users to dial emergency numbers is tested and maintained. See [Configuration for Emergency Calls](#) on page 776.

## **Short Code Fields**

Each short code has the following fields:

- **Short Code:** The digits which, if proved to be a best match to the dialed digits, trigger use of the short code. In addition to the normal dialing digits (0 to 9 plus \* and #), characters can also be used as follows:
  - Some characters have special meaning. For example, the wildcard **X** to match any single digit or **N** to match any set of digits. See [Short Code Characters](#) on page 979
  - Using characters also allows the creation of short codes which cannot be dialed from a phone but can be dialed from some applications.
- **Telephone Number:** The number used by the short code feature if needed, for example the outgoing number for a call to be passed to an external telephone line. Again special characters can be used in this field, see [Short Code Characters](#) on page 979.
- **Line Group ID:** This field is used for short codes that result in a number to be dialed, that is any short code set to one of the various **Dial** short code features. When that is the case, this field specifies the outgoing line group or ARS form to be used for the call.
  - For **Dial Emergency** short codes, this is overridden by the **Emergency ARS** setting of the extension's **Location** if configured.
- **Feature:** This sets the action to performed by the short code. See [Short Code Features](#) on page 997.
- **Locale:** Features that transfer the call to voicemail indicate the language required. If the required set of language prompts is not available, the voicemail system will fallback to another appropriate language if possible (refer to the appropriate voicemail installation manual for

details). The locale sent to the voicemail server by the system is determined in the following order of priority:

1. **Short Code Locale:** The short code locale, if set, is used if the call is routed to voicemail using the short code.
  2. **Incoming Call Route Locale:** The incoming call route locale, if set, is used if caller is external.
  3. **User Locale:** The user locale, if set, is used if the caller is internal.
  4. **System Locale:** If no user or incoming call route locale is set, the system locale is used unless overridden by a short code locale. Systems using Embedded Voicemail, if the required set of upgraded language prompts to match the locale is not present on the system SD card, Manager will display an error. The required prompt set can be uploaded from Manager using the Add/Display VM Locales option.
- **Force Account Code:** When selected, if the short code results in the dialing of an external number, the user is prompted to enter a valid account code before the call is allowed to continue. See [Account Code Configuration](#) on page 844.
  - **Force Authorization Code:** When selected, if the short results in the dialing of an external number, the user is prompted to enter a valid authorization code before the call is allowed to continue. See [Configuring authorization codes](#) on page 827.

## Short Code Descriptions

The short method for describing short codes in this manual, for example **9N/Dial/.0**, indicates the settings of main short code fields, each separated by a / as follows:

- **Code:** In this case **9N**.
- **Feature:** In this case **Dial**.
- **Telephone Number:** In this case the symbol . representing all dialed digits.
- **Line Group ID:** In this case the call is sent to outgoing line group **0**.

## Example Short Codes

- **\*17/VoicemailCollect/?U** A user dialing **\*17** is connected to their own mailbox to collect messages.
- **\*14\*N#/FollowMeTo/N** If a user dials **\*14\*210#** at their own extension, their calls are redirected to extension 210.

## Types of Short Code

In addition to different short code features, there are different types of short code:

- **Dialing Short Codes:** The following types of short code applied to on-switch dialing. The result may be an action to be performed by the system, a change to the user's settings or a number to be dialed. The order below is the order of priority in which they are used when applied to user dialing.
  - **User Short Codes:** These are usable by the specific user only. User short codes are applied to numbers dialled by that user and to calls forwarded via the user.
  - **User Rights Short Codes:** These are usable by any users associated with the user rights in which they are set. User Rights short codes are only applied to numbers dialed by that user. For example they are not applied to calls forwarded via the user.

- **System Short Codes:** These are available to all users on the system. They can be overridden by user or user rights short codes.
- **Post-Dialing Short Codes:** When any the short code above result in a number to be dialed, further short code can be applied to that number to be dialed. This is done using the following types of short codes.
  - **ARS (Alternate Route Selection) Short Codes:** The short code that matches dialing can specify that the resulting number should be passed to an ARS form. The ARS form can specify which routes should be used for the call by using further short code matches and also provide option to use other ARS forms based on other factors such as time and availability of routes.
  - **Transit Network Selection (TNS) Short Codes:** Used on T1 ISDN trunks set to use AT&T as the Provider. Applied to the digits presented following any other short code processing.
- **Incoming Number Short Codes:** On certain types of trunks short codes can be applied to the incoming digits received with calls.
  - **Line Short Codes:** These short codes are used to translate incoming digits received with calls. The stage at which they are applied varies between different line types and may be overridden by an extension number match.

## Short Code Characters

The short code fields **Short Code** and **Telephone Number** can contain the normal dialable digits \*, # and 0 to 9. In addition they can also use a range of special characters as listed below.

#### Short Code Field Characters

|    | Description                                                                                                                                  |
|----|----------------------------------------------------------------------------------------------------------------------------------------------|
| ?  | <b>Default Match</b><br><br>This character can be used on its own to create a short code match in the absence of any other short code match. |
| ?D | <b>Default Number Dialing</b><br><br>This character combination makes a call to the defined phone number as soon as the user goes off-hook.  |

| <b>?D(t)</b> | <b>Default Number Dialing Timeout</b><br>The character x represents time in seconds. If a phone is off-hook or speaker is enabled and no number is dialed for <b>t</b> seconds, the phone makes a call to the defined phone number. A maximum of 30 seconds is used for <b>t</b> though system accepts values more than 30 on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>F</b>     | <b>Failed Authentication</b><br>Match incoming SIP calls which failed authentication. See <a href="#">SIP Calling Number Verification (STIR/SHAKEN)</a> on page 967.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>N</b>     | <b>Match Any Digits</b><br>Matches any dialed digits (including none). The <b>Dial Delay Time</b> or a following matching character is used to resolve when dialing is complete.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>P</b>     | <b>Authenticated</b><br>Match incoming SIP calls which were authenticated. The character can be followed by the required attestation level or levels in " " quote marks. See <a href="#">SIP Calling Number Verification (STIR/SHAKEN)</a> on page 967.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Q</b>     | <b>Unauthenticated</b><br>Match incoming SIP calls which were not authenticated. See <a href="#">SIP Calling Number Verification (STIR/SHAKEN)</a> on page 967.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>X</b>     | <b>Match a Digit</b><br>Matches a single digit. When a group of X's is used, the short code matches against the total number of X's.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>[ ]</b>   | <b>Secondary Dial Tone Trigger</b><br>For pre-4.0 IP Office systems used to trigger secondary dial tone. Not used for Release 4.0+. See <a href="#">Secondary Dial Tone</a> on page 986.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>;</b>     | <b>Receive Sending Complete</b><br>When used this must be the last character in the short code string. <ul style="list-style-type: none"> <li>• If the <b>Dial Delay Count</b> is <b>0</b>, a ; instructs the system to wait for the number to be fully dialed, using the <b>Dial Delay Time</b> or the user dialing #, to indicate completion and then acting on the short code.</li> <li>• If the <b>Dial Delay Count</b> is not zero, the dialing is only evaluated when # is pressed. The majority of North-American telephony services use en-bloc dialing. Therefore the use of a ; is recommended at the end of all dialing short codes that use an N before routing those calls to a trunk or ARS. This is also recommended for all dialing where secondary dial tone short codes are being used.</li> </ul> |

### Telephone Number Field Characters

|          | Description                                                                                                                                                     |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>A</b> | <b>Allow Outgoing CLI</b><br>Allow the calling party number sent with the call to be used. This character may be required by service providers in some locales. |

|          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>C</b> | <b>Use Called Number Field</b> Place any following digits in the outgoing call's Called number field rather than the Keypad field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>D</b> | <b>Wait for Connect</b><br>Wait for a connect message before sending any following digits as DTMF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>E</b> | <b>Extension Number</b><br>Replace with the extension number of the dialing user. Note that if a call is forwarded this will be replaced with the extension number of the forwarding user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>h</b> | <b>Hold Music Source</b><br>When used as part of the short code telephone number field, this character allows the source for music on hold to be selected. Enter <b>h(X)</b> where <b>X</b> indicates the required hold music source if available. This overrides any previous hold music selection that may have been applied to the call. <ul style="list-style-type: none"> <li>• For IP500 V2 systems, the value of <b>X</b> can be 1 to 4.</li> <li>• For systems on a Linux based server, the value of <b>X</b> can be 1 to 32.</li> <li>• When used with Park Call short codes, the <b>h(X)</b> should be entered before the park slot number part of the telephone number.</li> </ul> |
| <b>I</b> | <b>Use Information Packet</b><br>Send data in an Information Packet rather than Set-up Packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>K</b> | <b>Use Keypad Field</b><br>Place any following digits in the outgoing call's Keypad field rather than the Called Number field. Only supported on ISDN and QSIG.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>l</b> | <b>Last Number Dialed</b> (lower case L)<br>Use the last number dialed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>L</b> | <b>Last Number Received</b><br>Use the last number received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>N</b> | <b>Dialed Digit Wildcard Match</b><br>Substitute with the digits used for the <b>N</b> or <b>X</b> character match in the Short Code number field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>p</b>  | <p><b>Priority</b></p> <p>The priority of a call is normally assigned by the Incoming Call Route or else is <b>1-Low</b> for all other calls. Dial Extn short codes can use <b>p(x)</b> as a suffix to the <b>Telephone Number</b> to change the priority of a call. Allowable values for <b>x</b> are <b>1, 2</b> or <b>3</b> for low, medium or high priority respectively.</p> <p>In situations where calls are queued, high priority calls are placed before calls of a lower priority. This has a number of effects:</p> <ul style="list-style-type: none"> <li>• Mixing calls of different priority is not recommended for destinations where Voicemail Pro is being used to provide queue ETA and queue position messages to callers since those values will no longer be accurate when a higher priority call is placed into the queue. Note also that Voicemail Pro will not allow a value already announced to an existing caller to increase.</li> <li>• If the addition of a higher priority call causes the queue length to exceed the hunt group's Queue Length Limit, the limit is temporarily raised by 1. This means that calls already queued are not rerouted by the addition of a higher priority call into the queue.</li> </ul>                                                                                                                                                                                                                                            |
| <b>r</b>  | <p><b>Ring Tone Plan</b></p> <p>When used as part of the short code telephone number field, this character can specify a Ring Tone Plan number. Enter <b>r (X)</b> where <b>X</b> is 1 to 8 indicating the Ring Tone Plan number to use.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>S</b>  | <p><b>Calling Number</b></p> <p>Place any following digits into the outgoing call's calling number field. Using <b>S</b> does not alter any allow or withhold CLI setting associated with the call, the short code characters <b>A</b> or <b>W</b> should be used respectively.</p> <ul style="list-style-type: none"> <li>• On mobile twinned calls, if the original party information is used or a specific calling party information CLI is set, that number overrides setting the outgoing CLI using short codes.</li> <li>• Note that for SIP trunks, the SIP URI configuration options override this setting.</li> </ul> <p> <b>Warning:</b></p> <ul style="list-style-type: none"> <li>• Changing the outgoing CLI for calls requires the line provider to support that function. You must consult with your line provider before attempting to change the outgoing CLI, failure to do so may result in loss of service. If changing the outgoing CLI is allowed, most line providers require that the outgoing CLI used matches a number valid for return calls on the same trunks. Use of any other number may cause calls to be dropped or the outgoing CLI to be replaced with a valid number. On mobile twinned calls, if the original party information is used or a specific calling party information CLI is set, that number overrides setting the outgoing CLI using short codes.</li> </ul> |
| <b>SS</b> | <p><b>Pass Through Calling Number</b></p> <p>Pass through the Calling Party Number. For example, to provide the incoming ICLID at the far end of a VoIP connection, a short code <b>?</b> with telephone number <b>.SS</b> should be added to the IP line.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>i</b>  | <p><b>National</b></p> <p>Both the <b>S</b> and <b>SS</b> characters can be followed by an <b>i</b>, that is <b>Si</b> and <b>SSi</b>. Doing this sets the calling party number plan to ISDN and number type to National. This may be required for some network providers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Table continues...

|            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>t</b>   | <b>Allowed Call Duration</b><br>Set the maximum duration in minutes for a call plus or minus a minute. Follow the character with the number of minutes in brackets, for example <b>t(5)</b> .                                                                                                                                                                                                                                                                                                                                        |
| <b>U</b>   | <b>User Name</b><br>Replace with the User Name of the dialing user. Used with voicemail.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>W</b>   | <b>Withhold Outgoing CLI</b><br>Withhold the sending of calling ID number. Operation is service provider dependent.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Y</b>   | <b>Wait for Call Progress Message</b><br>Wait for a Call Progress or Call Proceeding message before sending any following digits as DTMF. For example, the Y character would be necessary at a site where they have signed up with their telephone service provider to withhold international dialing until a DTMF pin/account number is entered that initiates the call progress/proceeding message.                                                                                                                                |
| <b>Z</b>   | <b>Calling Party Name</b><br>This option can be used with trunks that support the sending of name information. The <b>Z</b> character should be followed by the name enclosed in " " quotation marks. Note that there may be name length restrictions that vary between line providers. The changing of name information on calls being forwarded or twinned may also not be supported by the line provider.                                                                                                                         |
| <b>@</b>   | <b>Use Sub Address Field</b><br>Enter any following digits into the sub-address field.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>.</b>   | <b>Dialed Digits</b><br>Replace with the full set of dialed digits that triggered the short code match.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>,</b>   | <b>One Second Pause</b><br>Add a one second pause in DTMF dialing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>;</b>   | <b>Receive Sending Complete</b><br>When used this must be the last character in the short code string. If the <b>Dial Delay Count</b> is 0, a ; instructs the system to wait for the number to be fully dialed, using the <b>Dial Delay Time</b> or the user dialing #, to indicate completion and then acting on the short code. If the <b>Dial Delay Count</b> is not zero, the dialing is only evaluated when # is pressed.                                                                                                       |
| <b>" "</b> | <b>Non-Short Code Characters</b><br>Use to enclose any characters that should not be interpreted by the IP Office as possible short code special characters. For example, characters being passed to the voicemail server for interpretation there.<br><ul style="list-style-type: none"><li>• Ensure you use straight quotation marks like "..." when entering short codes into the IP Office configuration. Various editing, publishing and copying tools often replace those with angled or smart-quotes such as "...".</li></ul> |

## User Dialing

The following rules are used when short code matching is performed for user dialing:

- A short code is used immediately an exact match is found unless followed by a ; semi-colon.
  - If a ; semi-colon is present, dialing complete can be indicated by the user pressing # or the **Dial Delay Time** (see below) expiring.
- If no match is found but partial matches exist, the user can continue dialing.
- If no match or partial matches are found, incompatible is returned.
- The following precedence is used to determine which short codes are used:
  - Extension number matches override all short codes.
  - User short codes override user rights and system short codes.
  - User Rights short code matches override system short codes.
- When multiple exact matches exist:
  - The match with the most specified digits rather than wildcards is used.
  - If there are still more than one match, the match with the most exact length is used. This means X single-digit wildcards will override N multiple0digit wildcards when both match.
- The rules above are applied even if the number is dialed by selection from a directory or using any other method of stored number dialing.

### User Digit Dialing Settings

The following system settings influence user dialing.

- **Dial Delay Count:** *Default = 0 (US/Japan), 4 (ROW).*

This value sets the number of digits dialed before the system starts looking for short code matches.

- **Dial Delay Time:** *Default = 4 seconds (US/Japan), 1 second (ROW).*

This value sets the maximum allowed interval between the dialing of each digit. If exceeded, the system treats dialing as completed and looks for a short code match even if the **Dial Delay Count** has not been reached.

- **Off-Hook Timer:**

When a user goes off-hook, the system starts a 30 second off-hook timer (10 seconds in Italy). If the off-hook timer expires before a short code match occurs, the user is disconnected.

## User Dialing Flowchart

---

## Application Dialing

Numbers speed dialed by system applications such as SoftConsole are treated differently. Since the digits are received en bloc as a single group, they can override some short code matches. The same applies to short codes used within system configuration settings such as Incoming Call Route destinations.

Example:

- Telephone Number: 12345678
- Short Code 1: 1234XX/Dial/Extn/207
- Short Code 2: 12345678/Dial Extn/210

If dialed manually by the user, as soon as they have dialed 123456 a match to short code 1 occurs. They can never dial short code 2.

If dialed using an application, 12345678 is sent as a string and a match to short code 2 occurs.

### Partial Dialing

If the application dialing does not trigger an exact match, the user can dial additional digits through their extension. The processes for normal user dialing are applied.

### Non-Digit Short Codes

Short codes can be created that use alphabetic characters instead of numbers. While these short codes cannot be dialed from a phone, they can be dialed using application speed dials and settings. However characters that are interpreted as special short code characters will still be interpreted as such.

## Secondary Dial Tone

Some locales prefer to provide users with secondary dial tone once they have started dialing external calls. This dial tone is heard by the user until they have completed dialing and a trunk is seized at which point call progress tones are provided by the trunk, or camp on/busy tone is provided by the system if the required trunk cannot be seized.

### Release 4.0 and Higher

The use of secondary dial tone is provided through the **Secondary Dial Tone** check box option on the ARS form to which the call is routed. When on, this setting instructs the system to play secondary dial tone to the user.

The tone used is set as either **System Tone** (normal dial tone) or **Network Tone** (secondary dial tone). Both tone types are generated by the system in accordance with the system specific locale setting. Note that in some locales normal dial tone and secondary dial tone are the same.

When **Secondary Dial Tone** is selected, the ARS form will return tone until it receives digits with which it can begin short code matching. Those digits can be the result of user dialing or digits passed by the short code which invoked the ARS form. For example with the following system short codes:

In this example, the 9 is stripped from the dialed number and is not part of the telephone number passed to the ARS form. So in this case secondary dial tone is given until the user dials another digit or dialing times out.

- **Code:** 9N
- **Telephone Number:** N
- **Line Group ID:** 50 Main

In this example, the dialed 9 is included in the telephone number passed to the ARS form. This will inhibit the use of secondary dial tone even if secondary dial tone is selected on the ARS form.

- **Code:** 9N
- **Telephone Number:** 9N
- **Line Group ID:** 50 Main

#### Pre-4.0 IP Office Secondary Dial Tone

Pre-4.0 systems provided dial tone through the use of the short code feature Secondary Dial Tone and the [ ] special characters. For example, on a system where 9 is used as a prefix for external dialing, the system short code 9/./Secondary Dial Tone/0 will trigger secondary dial tone when users dial a number prefixed with 9. This method is not supported by Release 4.0 which provides ARS forms for the control of outgoing calls.

In order to allow further digit matching, the digits dialed are put back through short code matching against any short codes that start with [n] where n is the digit used to trigger the system secondary dial tone short code.

On all systems where secondary dial tone is used, a ; should also be used in dialing short codes that contain N.

For example:

#### System Short Codes

- 9/SecondaryDialTone/.
- [9]0N;/Dial/0

#### User Short Code

[9]0N;/Busy/0

The user dials 90114445551234. The 9 matches the system secondary dial tone short code and unlike other short codes this is applied immediately. The user's dialing is put through short code matching again using the normal order of precedence but matched to possible short codes beginning [9]. In this case the user's [9]0N; short code would take precedence over the system [9]0N; short code.

## ? Short Codes

The ? character can be used in short codes in the following ways:

### Default Short Code Matching:

? short codes are used in short code matching in the following way. If no user or system short code match is found, the system will then look for a ? short code match. It will look first for a user ? short code and then, if not found, a system ? short code.

Example: On systems outside North America, the system short code **?/Dial/.0** is added as a default short code. This short code provides a match for any dialing to which there is no other match. Therefore, on systems with this short code, the default is that any unrecognized number will be dialed to Outgoing Line Group 0.

### Hot-Line Dialing:

A user short code **?D** can be used to perform a short code action immediately the user extension goes off-hook. This is supported with Dial type short code features. Typically it is used with door, lift and lobby phones to immediately connect the phone to a number such as the operator or reception.

### Voicemail Collect Short Codes:

The ? character can appear in the **Telephone Number** field of a short code. This is done with short codes using the VoicemailCollect feature. In this instance the ? character is not interpreted by the system, it is used by the voicemail server.

## Short Code Matching Examples

The following examples are not meant as practical examples. However they are simple to implement and test on real system without conflicting with its normal operation. They illustrate the interaction between different short codes in resolving which short code is an exact match. They assume that extension numbers are in the 200 to 299 range.

- The term 'dials' means dialing the indicated digit or digits without the inter-digit Dial Delay Time expiring.
- The term 'pause' means a wait that exceeds the inter-digit Dial Delay Time.

**Scenario 1**

- Short Code 1 = 60/Dial Extn/203
- Dial Delay Count = 0. Dial Delay Time = 4 seconds.

| Test | Dialing | Effect                                                                                                                                                     |
|------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | 8       | No possible match, incompatible returned immediately                                                                                                       |
| 2    | 6       | No exact match but there is a potential match, so the system waits. When the Dial Delay Time expires, no exact match is found so incompatible is returned. |
| 3    | 60      | Exact match to Short Code 1. Extension 203 called immediately.                                                                                             |
| 4    | 61      | No possible match, the system returns incompatible.                                                                                                        |

**Scenario 2**

- Short Code 1 = 60/Dial Extn/203
- Short Code 2 = 601/Dial Extn/210
- Dial Delay Count = 0. Dial Delay Time = 4 seconds.

| Test | Dialing | Effect                                                                                     |
|------|---------|--------------------------------------------------------------------------------------------|
| 1    | 8       | No possible match, incompatible returned immediately                                       |
| 2    | 60      | Exact match to Short Code 1. Extension 203 called immediately.                             |
| 3    | 601     | Exact match to Short Code 1 as soon as the 0 is dialed. The user cannot manually dial 601. |

**Scenario 3**

Short Code 1 = 60/Dial Extn/203

Short Code 2 = 601/Dial Extn/210

Dial Delay Count = 3. Dial Delay Time = 4 seconds.

| Test | Dialing | Effect                                                                                                                                                                                                     |
|------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | 8       | Insufficient digits to trigger matching. The system waits for additional digits or for Dial Delay Time to expire. When Dial Delay Time expires, no possible match is found so incompatible is returned.    |
| 2    | 60      | Insufficient digits to trigger matching. The system waits for additional digits or for Dial Delay Time to expire. When Dial Delay Time expires, matching started and exact match to Short Code 1 occurs. . |
| 3    | 601     | Third digit triggers matching. Exact match to Short Code 2. Extension 210 dialed immediately.                                                                                                              |
| 4    | 60#     | # is treated as a digit and as the third digit triggers matching. No exact match found. The system returns incompatible.                                                                                   |

**Scenario 4**

- Short Code 1 = 60;/Dial Extn/203
- Short Code 2 = 601/Dial Extn/210

- Dial Delay Count = 3. Dial Delay Time = 4 seconds.

| Test | Dialing | Effect                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | 8       | Insufficient digits to trigger matching. The system waits for additional digits or for Dial Delay Time to expire. When Dial Delay Time expires, no possible match is found so incompatible is returned.                                                                                                                                                                                                                |
| 2    | 6       | Insufficient digits to trigger matching. The system waits for additional digits or for the interdigit Dial Delay Time to expire. If the Dial Delay Time expires, a potential match exists to a short code that uses ; so the system waits for an additional digit until the off-hook timer expires.                                                                                                                    |
| 3    | 60      | As above but an additional digit now may create a match.<br><br>If 1 is dialed, it creates an exact match to Short Code 2 and is used immediately.<br><br>If 0, * or 2 to 9 is dialed, no possible match exists. The system returns incompatible.<br><br>If the next digit is a #, it is treated as signaling dialing complete rather than being a digit. Short code 1 becomes an exact match and is used immediately. |
| 4    | 601     | Third digit triggers matching. Exact match to Short Code 2. Extension 210 dialed immediately.                                                                                                                                                                                                                                                                                                                          |

### Scenario 5

- Short Code 1 = 601/Dial Extn/203
- Short Code 2 = 60N/Dial Extn/210
- Dial Delay Count = 0. Dial Delay Time = 4 seconds.

| Test | Dialing | Effect                                                                                                                                                                          |
|------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | 6       | No exact match but there is a potential match, so the system waits for additional dialing. If the Dial Delay Time expires, no exact match is found so incompatible is returned. |
| 2    | 60      | Potential match to both short codes. The system waits for additional dialing. If the Dial Delay Time expires, Short Code 2 becomes an exact match with N blank.                 |
| 3    | 601     | Exact match to Short Code 1. Used immediately                                                                                                                                   |
| 4    | 602     | Exact match to Short Code 2. Used immediately.                                                                                                                                  |

### Scenario 6

- Short Code 1 = 601/Dial Extn/203
- Short Code 2 = 60N/Dial Extn/210
- Short Code 3 = 60X/Dial Extn/207
- Dial Delay Count = 0. Dial Delay Time = 4 seconds.

| Test | Dialing | Effect                                                                                                                                                                                                                                |
|------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | 6       | No exact match but there are potential matches so the system waits for additional dialing. If the Dial Delay Time expires, no exact match has occurred so incompatible is returned.                                                   |
| 2    | 60      | Potential match to all short codes. System waits for additional dialing. If the Dial Delay Time expires, Short Code 2 becomes an exact match with N blank. If a digit is dialed, Short Code 3 becomes a more exact match and is used. |
| 3    | 601     | Exact match all short code, however Short Code 1 is treated as being more exact (more matching digits) and is used immediately                                                                                                        |
| 4    | 602     | Exact match to short codes 2 and 3, however the Short Code 3 is treated as being more exact (length match) and is used immediately.                                                                                                   |

### Scenario 7

- Short Code 1 = 601/Dial Extn/203
- Short Code 2 = 60N/Dial Extn/210
- Short Code 3 = 6XX/Dial Extn/207
- Dial Delay Count = 0. Dial Delay Time = 4 seconds.

| Test | Dialing | Effect                                                                                                                                                                                                                                 |
|------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | 6       | No exact match but there are potential matches so the system waits for additional dialing. If the Dial Delay Time expires, no exact match has occurred so incompatible is returned.                                                    |
| 2    | 60      | Potential match to all short codes. System waits for additional dialing. If the Dial Delay Time expires, Short Code 2 becomes an exact match with N blank. If a digit is dialed, Short Code 3 becomes an more exact match and is used. |
| 3    | 601     | Exact match all short code, however Short Code 1 is treated as being more exact (more matching digits) and is used immediately                                                                                                         |
| 4    | 602     | Exact match to short codes 2 and 3, however the Short Code 2 is treated as being more exact (more matching digits) and is used immediately.                                                                                            |
| 5    | 612     | Exact match to Short Code 3.                                                                                                                                                                                                           |

## Default System Short Code List

Most control units are available in A-Law and U-Law models. Typically U-Law models are supplied to North American locales, A-Law models are supplied to the rest of the world. In addition to the using different default companding for digital lines and phone, A-Law and U-Law models support different default short codes. The following table lists the default system short codes present in a system's configuration.

**Standard Mode**

| Short Code | Telephone Number | Feature                        | A-Law | U-Law |
|------------|------------------|--------------------------------|-------|-------|
| *00        | Blank            | Cancel All Forwarding          | ✓     | ✓     |
| *01        | Blank            | Forward Unconditional On       | ✓     | ✓     |
| *02        | Blank            | Forward Unconditional Off      | ✓     | ✓     |

| *809XX     | "AA:"N".09       |                                                                                                                                                                                                                                                                                 |
| *850XX     | "AA:"N".10       |                                                                                                                                                                                                                                                                                 |
| *851XX     | "AA:"N".11       |                                                                                                                                                                                                                                                                                 |

## General

For U-Law systems, a **9N** is a default short code on the Primary Server while a **?** short code is a default on all other servers.

Additional short codes of the form \*DSSN, \*SDN, \*SKN, these are used by the system for internal functions and should not be removed or altered. Short codes \*#N and \*\*N may also be visible, these are used for ISDN functions in Scandinavian locales.

The default **\*34** short code for music on hold has changed to **\*34N**;

## Auto Attendant

This feature is used with auto-attendants for recording greetings and to transfer calls to an auto-attendant.

### Details

- **Telephone Number:** ✓
  - System short codes (\*81XX, \*82XX, \*83XX and \*84XX) are automatically added for use with all auto-attendants. These are used for morning, afternoon, evening and menu options greetings respectively. These short codes use a **Telephone Number** of the form

"AA: "N" . Y" where N is the replaced with the auto attendant number dialed and Y is 1, 2, 3 or 4 for the morning, afternoon, evening or menu option greeting.

- To add a short code to call an auto-attendant, omit the XX part. For example, add the short code \*80XX/Auto Attendant/"AA: "N if internal dialed access to auto-attendants is required.
- System short codes \*800XX, \*801XX, ..., \*809XX, \*850XX, and \*851XX are also automatically added for recording prompts for any **Page and Page** actions. The codes correspond to the key to which the action has been assigned; 0 to 9, \* and # respectively. These short codes use a **Telephone Number** of the form "AA: "N" . 00", ..., "AA: "N" . 01", "AA: "N" . 10" and "AA: "N" . 11" respectively.
- **Release:** 2.0+.
- **Programmable Button Control:** ✗
- **Default Short Code:** ✔ See Configuration Settings | Auto Attendant.

## Break Out

This feature is usable within a system multi-site network. It allows a user on one system in the network to specify that the following dialing be processed by another system on the network as if the user dialed it locally on that other system.

### Details

- **Telephone Number:** The IP Address or Name of the system, using \* characters in place of . characters.
- **Default Short Code:** ✖
- **Programmable Button Control:** BkOut
- **Release:** 4.0+.

### Examples

On a system, to break out via a system called RemoteSwitch with the IP Address 192.168.42.3, either of the following short codes could be used.

Example 1 allows break out using any remote switch by dialing its IP address, for example \*80\*192\*168\*42\*3#. Example 2 does this for a specific remote system by dialing just \*81.

- **Example 1**
  - **Feature:** Break Out
  - **Telephone Number:** N
  - **Code:** \*80\*N#
- **Example 2**
  - **Code:** \*81
  - **Telephone Number:** RemoteSwitch
  - **Feature:** Break Out

[Short Code Features](#) on page 997

---

## Barred

This short code feature can be used for call barring by using the short code as the call destination. This short code feature was previously called **Busy**. It has been renamed but its function has not changed.

When used in an ARS form that has been configured with an Alternate Route, for callers whose dialing has matched the short code no further routing is applied.

### Details

- **Telephone Number:** ✖

- **Default Short Code:** ✗
- **Programmable Button Control:** ✗
- **Release:** 1.0+.

#### Related links

[Short Code Features](#) on page 997

---

## Busy On Held

When on, busy on held returns busy to new calls when the user has an existing call on hold. This short code feature is useful when a user does not want to be distracted by an additional incoming call when they have a call on hold.

#### Details

- **Telephone Number:** ✔ Y or 1 for on, N or 0 for off.
- **Default Short Code:** ✗
- **Programmable Button Control:** ✔ BusyH
- **Release:** 1.0+.

#### Example: Turning Busy on Held on

If on, when the user has a call on hold, new calls receive busy tone (ringing if analog) or are diverted to Voicemail if enabled, rather than ringing the user.

This overrides call waiting when the user has a call on hold.

- **Short Code:** \*12
- **Telephone Number:** Y
- **Feature:** BusyOnHeld

#### Example: Turning Busy on Held off

Another short code must be created to turn the Busy on Held feature off. If off, when the user has a call on hold, new calls will still get directed to the user.

- **Short Code:** \*13
- **Telephone Number:** N
- **Feature:** BusyOnHeld

---

## Call Intrude

This feature allows you to intrude on the existing connected call of the specified target user. All call parties are put into a conference and can talk to and hear each other. A **Call Intrude** attempt to a user who is idle becomes a Priority Call.

- Intrusion features are controlled by the **Can Intrude** setting of the user intruding and the **Cannot Be Intruded** setting of user being intruded on. By default, no users can intrude and all users cannot be intruded.
- Intrusion features uses system conference resources during the call. If insufficient conference resource are available, the feature cannot be used.
- Users can use privacy features to set a call cannot be intruded on and recorded.
- Intruding onto a user doing silent monitoring (see [Call Listen](#) on page 1004) is turned into a silent monitoring call.

The system support a range of other call intrusion methods in addition to this feature.

### Details

- **Telephone Number:** ✓ Target extension number.
- **Default Short Code:** ✗
- **Programmable Button Control:** ✓ Intru
- **See also:** [Call Listen](#) on page 1004, [Coaching Intrusion](#) on page 1020, [Dial Inclusion](#) on page 1028, [Whisper Page](#) on page 1084.
- **Release:** 1.0+.

### Related links

[Short Code Features](#) on page 997

---

## Call Listen

This feature allows you to monitor another user's call without being heard.

- By default, monitoring is accompanied by a tone heard by all parties. Use of the tone is controlled by the **Beep on Listen** setting on the **System > Telephony > Tones and Music** tab.

### Warning:

- Listening to a call without the other parties being aware is subject to local regulations. You must ensure that you have complied with the local regulations. Failure to do so can result in penalties.

The use of call listen is dependent on:

- The target being a member of the group set as the user's **Monitor Group (User > Telephony > Supervisor Settings)**. The user does not have to be a member of the group.

- Intrusion features are controlled by the **Can Intrude** setting of the user intruding and the **Cannot Be Intruded** setting of user being intruded on. By default, no users can intrude and all users cannot be intruded.
- Intrusion features uses system conference resources during the call. If insufficient conference resource are available, the feature cannot be used.

A number of features are supported for call listening:

- Users can use privacy features to set a call cannot be intruded on and recorded.
- IP extensions can be monitored including those using direct media.
- The monitoring call can be initiated even if the target user is not currently on a call and remains active until the monitoring user clears the monitoring call.
- The user who initiated the call listen can also record the call.

Intruding onto an a user doing silent monitoring (Call Listen) is turned into a silent monitoring call.

1400, 1600, 9400, 9500, and 9600 Series phones with a user button can initiate listening using that button if the target user meets the criteria for listening.

The system support a range of other call intrusion methods in addition to this feature.

### Details

- **Telephone Number:** ✓ Target extension number (extension must be local).
- **Default Short Code:** ✗
- **Programmable Button Control:** ✓ Listn
- **See also:** [Call Intrude](#) on page 1004, [Coaching Intrusion](#) on page 1020, [Dial Inclusion](#) on page 1028, [Whisper Page](#) on page 1084.
- **Release:** 1.0+.

### Example

User 'Extn205' wants to be able to monitor calls received by members of the Hunt Group 'Sales'.

1. For user 'Extn205', in the **Monitor Group (User > Telephony > Supervisor Settings)** list box, select the hunt group.
2. Ensure that **Can Intrude** is checked.
3. Create a user short code to allow Extn205 to start monitoring.
  - **Short Code:** \*89\*N#
  - **Telephone Number:** N
  - **Line Group ID:** 0.
  - **Feature:** CallListen
4. For each member of the hunt group, check that their **Cannot be Intruded** setting is unchecked.
5. Now when a member of the 'Sales' hunt group is on a call, Extn205 can replace N in the short code with the extension number of that member and monitor their call.

### Related links

[Short Code Features](#) on page 997

---

## Call Park

Parks the user's current call into the specified park slot number. The call can then be retrieved by other extensions (refer to the appropriate telephone user guide). While parked the caller hears music on hold if available. The 'Unpark Call' feature can be used to retrieve calls from specific park slots.

Park Timeout (System | Telephony | Telephony) controls how long a call will remain parked. When this expires the call will recall to the parking user if they are idle or when they next become idle. The recall call will continue ring and does follow any forwards or go to voicemail.

### Details

- **Telephone Number:** ✓ Park slot number.
  - Park slot IDs can be up to 9 digits in length. Names can also be used for application park slots.
  - If no park slot number is specified when this short code is used, the system automatically assigns a park slot number based on the extension number of the user parking the call plus one digit 0 to 9.
- **Default Short Code:** ✓ \*37\*N#
- **Programmable Button Control:** ✓ Call Park
- **See also:** Unpark Call.
- **Release:** 1.0+.

### Example

This short code is a default within the system configuration. This short code can be used to toggle the feature on/off. N represents the park slot number in which the call will be parked. For example, if a user wants to park a call to slot number 9, the user would dial \*37\*9#. The call will be parked there until retrieved by another extension or the original extension.

- **Short Code:** \*37\*N#
- **Telephone Number:** N
- **Feature:** ParkCall

### Related links

[Short Code Features](#) on page 997

---

## Call Park and Page

Parks the user's current call into the highest park slot number within the range specified on the **System | Telephony | Park & Page** tab, in the **Central Park Range** field. For example, if the specified **Central Park Range** is 1XX, then the Park & Page short code would attempt to Park on 199. If the range is 567XX, then the call would attempt to Park on 56799.

Call Park and Page via short code is primarily useful for phones with no display, or phones on which a Call Park operation is seldom performed. It provides a way for the user to Central Park

in a pre-known location. If the highest Central Park slot is already in use, then the short code Call Park and Page attempt will not be successful.

In order to perform a Page after a successful Call Park via short code, the user must enter a valid Page short code.

#### Details

- **Telephone Number:** ✗
- **Default Short Code:** ✗
- **Programmable Button Control:** ✔ Call Park and Page
- **Release:** 9.0+.

#### Related links

## Call Pickup Any

Pick up the first available ringing call.

#### Details

- **Telephone Number:** ✗
- **Default Short Code:** ✔ \*30
- **Programmable Button Control:** ✔ PickA
- **See also:** Call Pickup Extn, Call Pickup Group, Call Pickup Members, Acquire Call, Call Pickup Line, Call Pickup User.
- **Release:** 1.0+.

#### Example

Below is an example of the short code setup:

- **Short Code:** \*30
- **Feature:** CallPickupAny

#### Related links

[Short Code Features](#) on page 997

---

## Call Pickup Extn

Pick up a ringing call from a specific extension.

### Details

- **Telephone Number:** ✓ Target extension number.
- **Default Short Code:** ✓ \*32\*N#
- **Programmable Button Control:** ✓ CpkUp
- **See also:** Call Pickup Any, Call Pickup Group, Call Pickup Members, Acquire Call, Call Pickup Line, Call Pickup User.
- **Release:** 1.0+.

### Example

This short code is a default within the system configuration. N represents the specific extension. For example, if a user dials \*32\*201#, they will pick up the call coming into extension 201.

- **Short Code:** \*32\*N#
- **Telephone Number:** N
- **Feature:** CallPickupAny

### Related links

[Short Code Features](#) on page 997

---

## Call Pickup Group

Pick up a call ringing any hunt group of which the user is a member. The user can use this feature even if their membership of the group is currently set as disabled.

### Details

- **Telephone Number:** ✗
- **Default Short Code:** ✓ \*31
- **Programmable Button Control:** ✓ PickG
- **See also:** Call Pickup Any, Call Pickup Extn, Call Pickup Members, Acquire Call, Call Pickup Line, Call Pickup User.
- **Release:** 1.0+.

### Example

Below is an example of the short code setup.

- Short Code: \*31
- Feature: CallPickupGroup

### Related links

[Short Code Features](#) on page 997

---

## Call Pickup Line

Pick up an incoming call which is alerting, parked or held. The pickup uses the Line Appearance ID specified in Telephone Number field of the short code. It cannot be used to pickup conferenced calls. The normal user intrusion features are not applied to this pickup feature.

### Details

- **Telephone Number:** ✓ Target Line Appearance ID.
- **Default Short Code:** ✗
- **Programmable Button Control:** ✗
- **See also:** Call Pickup Any, Call Pickup Extn, Call Pickup Group, Call Pickup Members, Acquire Call, Call Pickup User.
- **Release:** 4.0+ (Added in the Release 4.0 Q2 2007 maintenance release).

### Example

This short code is a default within the system configuration. N represents the specific Line Appearance ID.

- **Short Code:** \*89\*N#
- **Telephone Number:** N
- **Feature:** CallPickupLine

### Related links

---

## Call Pickup Members

This feature can be used to pick up a ringing or queuing call at an extension that is a member of the Hunt Group specified. The call picked up does not have to be a hunt group call. The function includes group members even if their membership of the group is currently disabled.

### Details

- **Telephone Number:** ✓ Group number or "Group name".
- **Default Short Code:** ✓ \*53\*N#
- **Programmable Button Control:** ✓ PickM
- **See also:** Call Pickup Any, Call Pickup Extn, Call Pickup Group, Acquire Call, Call Pickup Line, Call Pickup User.
- **Release:** 1.0+.

## Example

Below is an example of the short code setup. N represents the extension number of the Hunt Group. For example, if a user dials \*53\*500#, they will pick up the call coming into extension 500 (the hunt group's extension).

- **Short Code:** \*53\*N#
- **Telephone Number:** N
- **Feature:** CallPickupMembers

# Call Pickup User

Pick up an incoming call which is alerting, parked or held. The pickup uses the user extension number specified in Telephone Number field of the short code. If there are multiple calls, priority is given to picking up alerting, then parked and then held in that order of priority. It cannot be used to pickup conferenced calls. The normal user intrusion features are not applied to this pickup feature.

## Details

- **Telephone Number:** ✓ Target user extension number.
- **Default Short Code:** ✗
- **Programmable Button Control:** ✗
- **See also:** Call Pickup Any, Call Pickup Extn, Call Pickup Group, Call Pickup Members, Acquire Call, Call Pickup Line.
- **Release:** 4.0+.

## Example

N represents the specific user.

- **Short Code:** \*89\*N#
- **Telephone Number:** N
- **Feature:** CallPickupUser

# Call Queue

Queue the current call to the destination phone, even when the destination phone is busy. This is the same as a transfer except it allows you to transfer to a busy phone.

### Details

- **Telephone Number:** ✓ Target extension number.
- **Default Short Code:** ✓ \*33\*N#
- **Programmable Button Control:** ✓ Queue
- **Release:** 1.0+.

### Example

Below is an example of the short code setup. N represents the extension the caller wishes to queue for. For example, if a user dials \*33\*201# while connected to a caller, this caller will be queued for extension 201.

- **Short Code:** \*33\*N#
- **Telephone Number:** N
- **Feature:** CallQueue

## Call Record

This feature allows you to record a conversation. To use this requires Voicemail Pro. Refer to your local regulations in relation to the recording of calls.

- An advice of recording warning will be given if configured on the voicemail system.
- The recording is placed in the mailbox specified by the user's **Manual Recording Mailbox** setting.
- Intrusion features uses system conference resources during the call. If insufficient conference resource are available, the feature cannot be used.
- Users can use privacy features to set a call cannot be intruded on and recorded.

### Details

- **Telephone Number:** ✓ Target extension number.
- **Default Short Code:** ✗
- **Programmable Button Control:** ✓ Recor
- **Release:** 1.0+.

### Example: Record your own extension's call

To use this short code, the user should place the call on hold and dial \*55. They will automatically be reconnected to the call when recording begins.

- **Short Code:** \*55
- **Telephone Number:** None

- **Feature:** CallRecord

## Call Steal

This function allows a user to seize a call answered or ringing on another extension. This function can be used with or without a specified user target.

- If the target has multiple alerting calls, the function steals the longest waiting call.
- If the target has a connected call and no alerting calls, the function steals the connected call. This is subject to the **Can Intrude** setting of the **Call Steal** user and the **Cannot Be Intruded** setting of the target.
- If no target is specified, the function attempts to reclaim the user's last ringing or transferred call if it has not been answered or gone to voicemail.
- Stealing a video call changes the call to an audio call.
- R11.1 FP2 SP4 and higher: The shortcode for this feature can be used with the user's own extension number. That enables twinned and simultaneous device users to move a connected call from another one of their devices. This usage ignores the user's privacy and intrusion settings.

#### Details

- **Telephone Number:** ✓
  - Target extension number.
  - User's own extension number to move call from other simultaneous device. This can include using the `U` short code character.
  - Blank for last call transferred.
- **Default Short Code:** ✓ \*45\*N# and \*46
- **Programmable Button Control:** ✓ Acquire
- **Release:** 2.1+

#### Example: Taking Over a Call

In this example, `N` represents the extension to be taken over. For example, if a user dials \*45\*201#, they will take over the current call on extension 201.

- **Short Code:** \*45\*N#
- **Telephone Number:** N
- **Feature:** Call Steal

### Example: Reclaiming a Call

This short code reclaims the last call from your extension. This function is useful when you want to catch a call you have just missed that has gone off to Voicemail.

- **Short Code:** \*46
- **Feature:** Call Steal

## Change Login Code

Allows a user to change their login code. The login code must meet the **Login Code Complexity** requirements defined on the **System | Telephony** tab.

### Details

- **Telephone Number:** ✓ The user's current and new log in codes separated by a \*, see the examples below.
- **Default Short Code:** ✗
- **Programmable Button Control:** ✗

### Example

The user has a **Login Code** of **1234** and wants to change it to **5678**. To use the short code below, the user must dial **\*60\*1234\*5678#**.

- **Short Code:** \*60\*N#
- **Telephone Number:** N
- **Feature:** Change Login Code.

### Example

For a user with no login code currently set, they can still use the short code to set a login code. For example using the short code created above to set their login code to 1234 they should dial **\*60\*\*1234#**.

### Example

System phone users can also use this short code to change the login code of another user. For example 403 is configured as a system phone with a login code of **1234**. User 410 has forgotten their login code and needs it changed. User 403 can do this by dialing the following:

- **\*60\*410\*1234\*<new code>#**

# Clear Hunt Group Night Service

This feature changes the specified hunt group from Night Service mode to In Service mode.

Setting and clearing hunt group night service can be done using either manual controls or using a system time profile. The use of both methods to control the night service status of a particular hunt group is not supported.

This function is currently not supported between systems in a multi-site network. It can only be used by a user currently logged onto the same system as hosting the hunt group.

## Details

- **Telephone Number:** ✓
  - Hunt group extension number. If left blank, the short code will affect all hunt groups of which the user is a member.
  - The **Set Hunt Group Night Service** and **Clear Hunt Group Night Service** short code and button features can be used to switch an SSL VPN service off or on respectively. The service is indicated by setting the service name as the telephone number or action data. Do not use quotation marks.
- **Default Short Code:** ✓ \*21\*N#
- **Programmable Button Control:** ✓ HGNS-
- **See also:** Clear Hunt Group Out Of Service, Set Hunt Group Night Service, Set Hunt Group Out Of Service.
- **Release:** 1.0+.

## Example

Below is a sample of the short code setup. N represents the telephone number of the hunt group to be taken out of "Night Service" mode and placed into "In Service" mode. For example, when \*21\*201# is dialed, the hunt group associated with extension 201 will be taken out of "Night Service" mode.

- **Short Code:** \*21\*N#
- **Telephone Number:** N
- **Feature:** ClearHuntGroupNightService

# Coaching Intrusion

This feature allows the you to intrude on another user's call and to talk to them without being heard by the other call parties to which they can still talk. For example: User A is on a call with user B. When user C intrudes on user A, they can hear users A and B but can only be heard by user A.

- Intrusion features are controlled by the **Can Intrude** setting of the user intruding and the **Cannot Be Intruded** setting of user being intruded on. By default, no users can intrude and all users cannot be intruded.
- Intrusion features uses system conference resources during the call. If insufficient conference resource are available, the feature cannot be used.
- Listening to a call without the other parties being aware is subject to local regulations. You must ensure that you have complied with the local regulations. Failure to do so can result in penalties.

The system support a range of other call intrusion methods in addition to this feature.

## Details

- **Telephone Number:** ✓ Target extension number.
- **Default Short Code:** ✗
- **Programmable Button Control:** ✓ Coach.
- **See also:** Call Intrude, Call Listen, Dial Inclusion, Whisper Page.
- **Release:**9.0+

# Conference Add

Conference add controls can be used to place the user, their current call and any calls they have on hold into a conference. When used to start a new conference, the system automatically assigns a conference ID to the call. This is termed ad-hoc (impromptu) conferencing.

If the call on hold is an existing conference, the user and any current call are added to that conference. This can be used to add additional calls to an ad-hoc conference or to a meet-me conference. Conference add can be used to connect two parties together. After creating the conference, the user can drop from the conference and the two incoming calls remain connected.

For further details, see [Conferencing](#) on page 690.

## Details

- **Telephone Number:** ✖
- **Default Short Code:** ✔ \*47
- **Programmable Button Control:** ✔ Conf+
- **See also:** Conference Meet Me.
- **Release:** 1.0+.

## Example

Below is a sample of the short code setup.

- **Short Code:** \*47
- **Feature:** ConferenceAdd

[Short Code Features](#) on page 997

---

# Conference Meet Me

Conference meet-me refers to features that allow a user or caller to join a specific conference by using the conference's ID number (either pre-set in the control or entered at the time of joining the conference).

Non-subscription IP500 V2 systems require a **Preferred Edition** license.

### **Note:**

Conference Meet Me features can create conferences that include only one or two parties. These are still conferences that are using resources from the host system's conference capacity.

### Conference ID Numbers

By default, ad hoc conferences are assigned numbers starting from 100 for the first conference in progress. Therefore, for conference Meet Me features specify a number away from this range ensure that the conference joined is not an ad hoc conference started by other users. It is no longer possible to join a conference using conference Meet Me features when the conference ID is in use by an ad-hoc conference.

**User Personal Conference Number** Each user's own extension number is treated as their own personal conference number. Only that user is able to start a conference using that number as the conference ID. Any one else attempting to start a conference with that number will find themselves in a conference but on hold until the owner also joins. Personal conferences are always hosted on the owner's system.

 **Note:**

When a user calls from their mobile twinned number, the personal conference feature will only work if they access the conference using an FNE 18 service.

### Multi-Site Network Conferencing

Meet Me conference IDs are now shared across a multi-site network. For example, if a conference with the ID 500 is started on one system, anyone else joining conference 500 on any system will join the same conference. Each conference still uses the conference resources of the system on which it was started and is limited by the available conference capacity of that system.

Previously separate conferences, each with the same conference ID, could be started on each system in a multi-site network.

### Other Features

**Transfer to a Conference Button** A currently connected caller can be transferred into the conference by pressing **TRANSFER**, then the Conference Meet Me button and **TRANSFER** again to complete the transfer. This allows the user to place callers into the conference specified by the button without being part of the conference call themselves. This option is only supported on Avaya phones with a fixed **TRANSFER** button.

**Conference Button Status Indication** When the conference is active, any buttons associated with the conference ID indicate the active state.

For further details, see [Conferencing](#) on page 690.

### Details

- **Telephone Number:**  Conference number. This can be an alphanumeric value up to 15 characters.
  - The number can be prefixed with **H(x)** where **x** is the number of the music-on-hold source that should be played to the first caller to enter the conference.
- **Default Short Code:**  /  \*66\*N# on Server Edition systems.
- **Programmable Button Control:**  CnfMM
- **See also:** Conference Add.
- **Release:** 1.0+.

## Dial

This short code feature allows users to dial the number specified to an outside line.

### Details

- **Telephone Number:** ✓ Telephone number.
- **Default Short Code:** ✓ Various depending on locale and system type.
- **Programmable Button Control:** ✓ Dial
- **See also:** Dial Direct, Dial Emergency, Dial Extn, Dial Inclusion, Dial Paging.
- **Release:** 1.0+.

### Example: Creating a Speed Dial

In this example, users entering 401 on their telephone key pad will dial the New Jersey Office on 212 555 0000.

- **Short Code:** 401
- **Telephone Number:** 2125550000

### Example: Replace Outgoing Caller ID

This short code is useful in a "call center" environment where you do not want customers to have access to the number of your direct line; you want the general office number displayed. The sample short code below will force the outgoing caller ID to display 123.

Use of this feature is dependent upon your local service provider.

- **Short Code:** ?
- **Telephone Number:** .s123

### Example: External Dialing Prefix

The short code is for dialing a prefix for an outside line N represents the external number you want to call.

- **Short Code:** 9N
- **Telephone Number:** N

### Example: Blocking Caller ID

This is for blocking Caller ID for external calls. This feature can be applied to specific external numbers or to all out going calls. In most situations, the company will choose to block the caller ID for all external calls or leave it available for all external calls.

- **Short Code:** 9N
- **Telephone Number:** NW

### Example: Maximum Call Length

The character t can be used in dialing short codes to set the maximum allowed duration of a call. For example, the following short code will dial a number but then disconnect the call after 20 minutes (plus or minus a minute).

- **Short Code:** 9N
- **Telephone Number:** Nt(20)

## Dial CW

Call the specified extension number and force call waiting indication on if the extension is already on a call.

If the user has call appearance buttons programmed, call waiting will not get activated. The next incoming call will appear on an available call appearance button. When there are no available call appearance buttons, the next incoming call will receive busy tone.

**Details**

- **Telephone Number:** ✓ Extension number.
- **Default Short Code:** ✗
- **Programmable Button Control:** ✓ DCW
- **Release:** 1.0+.

**Example**

N represents the extension number to be dialed. For example, a user dialing \*97\*201# will force call waiting indication on at extension 201 if extension 201 is already on a call.

- **Short Code:** \*97\*N#
- **Telephone Number:** N
- **Feature:** DialCW

**Related links**

[Short Code Features](#) on page 997

---

## Dial Direct

Automatic intercom functions allow you to call an extension and have the call automatically answered on speaker phone after 3 beeps. The extension called must support a handsfree speaker. If the extension does not have a handsfree microphone then the user must use the handset if they want to talk. If the extension is not free when called, the call is presented as a normal call on a call appearance button if available.

### Details

- **Telephone Number:** ✓ Extension number
- **Default Short Code:** ✗
- **Programmable Button Control:** ✓ Direct
- **See also:** Dial Paging.
- **Release:** 1.0+.

### Example

This allows the extension specified to be automatically answered. N represents the extension that will be forced to automatically answer. For example, when a user dials \*83\*201#, extension 201 will be forced to automatically answer the call.

- **Short Code:** \*83\*N#
- **Telephone Number:** N
- **Feature:** DialDirect

## Dial Fax

This feature is used to route fax calls via Fax Relay.

### Details

- **Telephone Number:** ✔ Fax destination number.
- **Default Short Code:** ✗
- **Programmable Button Control:** ✗
- **Release:** 5.0+.

### Example

In this example, the line group ID matches the URI configured on a SIP line that has been configured for Fax Relay.

- **Short Code:** 6N
- **Telephone Number:** N"@192.16.42.5"
- **Line Group ID:** 17
- **Feature:** Dial Fax

### Related links

[Short Code Features](#) on page 997

---

## Dial Inclusion

This feature allows you to intrude on another user's call to talk to them. Their current call is put on hold while you talk and automatically reconnected when you end the intrusion. The intruder

and the target extension can then talk but cannot be heard by the other party. This can include intruding into a conference call, where the conference will continue without the intrusion target.

During the intrusion all parties hear a repeated intrusion tone. When the intruder hangs-up the original call parties are reconnected. Attempting to hold a dial inclusion call simply ends the intrusion. The inclusion cannot be parked.

- Intrusion features are controlled by the **Can Intrude** setting of the user intruding and the **Cannot Be Intruded** setting of user being intruded on. By default, no users can intrude and all users cannot be intruded.
- Intrusion features uses system conference resources during the call. If insufficient conference resource are available, the feature cannot be used.

The system support a range of other call intrusion methods in addition to this feature.

### Details

- **Release:** 1.4+.
- **See also:** Call Intrude, Call Listen, Coaching Intrusion, Whisper Page.
- **Programmable Button Control:** ✓ Inclu.
- **Default Short Code:** ✗
- **Telephone Number:** ✓ Target extension number.

### Example

N represents the extension to be intruded upon. For example, if a user dials \*97\*201# while extension 201 is on a call, then the user is intruding into extn. 201's current call.

- **Short Code:** \*97\*N#
- **Telephone Number:** N
- **Feature:** DialInclusion

## Dial Physical Extension by Number

Dial a specified extension number regardless of the current user logged in at that extension and any forwarding, follow me or do not disturb settings applied by the current extension user. Note that the extension number used is the Base Extension number set against the extension configuration settings.

#### Details

- **Telephone Number:** ✓ Base Extension number.
- **Default Short Code:** ✓ \*70\*N# (U-Law only) (not on Server Edition)
- **Programmable Button Control:** ✓ PhyEx
- **See also:** Dial Physical Extension By Id, Priority Call.
- **Release:** 1.4+.

#### Example

The example below allows the extension with the base extension number 201 to be called regardless of the extension number of the user currently logged in at that extension.

- **Short Code:** \*97
- **Telephone Number:** 201
- **Feature:** DialPhysicalExtnByNumber

## Dial Physical Extension By ID

Dial a specific extension using its system ID. This may be necessary in hot desking environments where some extensions have been created with no default extension number. Without an extension number, a call can not be made to that extension unless a short code is created.

#### Details

- **Telephone Number:** ✓ Extension ID
- **Default Short Code:** ✓ \*71\*N# (U-Law only)

- **Programmable Button Control:** ✓ DialP
- **See also:** DialPhysicalExtensionByNumber, Priority Call.
- **Release:** 1.4+.

### Example

In the above example, if the telephone at extension ID 16 is not associated with an extension number, a user can dial \*97 to connect to that phone. This may be useful in hot desking environments where some extensions may not have a dedicated base extension number.

- **Short Code:** \*97
- **Telephone Number:** 16
- **Feature:** DialPhysicalNumberByID

# Display Msg

Allows the sending of text messages to digital phones on the local system.

## Details

- **Telephone Number:** The telephone number takes the format `N";T"` where:
  - **N** is the target extension.
  - **T** is the text message. Note that the `" ;` before the text and the `"` after the text are required.
- **Default Short Code:** No
- **Programmable Button Control:** Displ

## Example

Below is a sample of the short code setup. When used, the target extension will hear a single ring and then see the message. If the target extension is on a call then may need to scroll the display to a free call appearance in order to see the text message.

- **Telephone Number:** `N";Visitor in Reception"`
- **Feature:** Display Msg

- **Short Code:** \*78\*N#

### Example: SIP Extension Message Waiting Indicator

You can use the Display Msg short code to turn an extension's message waiting indicator (MWI) on or off.

- **Telephone Number:** The telephone number takes the format N";T" where:
  - N is the target extension.
  - T is the text message. Note that the ";" before the text and the " after the text are required.
    - To turn MWI on, the telephone number must be N";Mailbox Msgs=1"
    - To turn MWI off, the telephone number must be N";Mailbox Msgs=0"

- **Default Short Code:** No

### Example

Below is a sample of the short code setup to turn MWI on. When used, the target extension will receive a message directing it to turn the MWI on.

- **Short Code:** \*99\*N#
- **Feature:** Display Msg
- **Telephone Number:** N";Mailbox Msgs=1"

### Example

Below is a sample of the short code setup to turn MWI off. When used, the target extension will receive a message directing it to turn the MWI off.

- **Short Code:** \*98\*N#
- **Feature:** Display Msg
- **Telephone Number:** N";Mailbox Msgs=0"

## Do Not Disturb Exception Add

This feature adds a number to the user's "Do Not Disturb Exception Numbers List". This can be an internal extension number or external ICLID. Calls from that number, except hunt group calls, will ignore the user's Do Not Disturb setting. For further details see Do Not Disturb (DND).

### Details

- **Telephone Number:** Telephone number or ICLID. Up to 31 characters. For ICLID numbers any prefix added by the system must also be included.
- **Default Short Code:** \*10\*N#

- **Programmable Button Control:** DNDX+
- **See also:** Do Not Disturb Exception Delete, Do Not Disturb On, Do Not Disturb Off.

### Example

N represents the number to be added to the user's "Do Not Disturb Exception List". For example, when a user has DND turned on and dials \*10\*4085551234#, incoming calls from telephone number (408) 555-1234. All other calls, except those numbers on the exception list hear busy tones or are redirected to voicemail if available.

- **Short Code:** \*10\*N#
- **Telephone Number:** N
- **Feature:** DoNotDisturbExceptionAdd

### Example

In this example, the last number received by the user is added to their exception list.

- **Short Code:** \*89
- **Telephone Number:** L
- **Feature:** DoNotDisturbExceptionAdd

### Related links

[Short Code Features](#) on page 997

## Do Not Disturb Exception Delete

This feature removes a number from the user's "Do Not Disturb Exception List". For further details see Do Not Disturb (DND).

### Details

- **Telephone Number:** ✓ Telephone number or ICLID.
- **Default Short Code:** ✓ \*11\*N#
- **Programmable Button Control:** ✓ DNDX-
- **See also:** Do Not Disturb Exception Add, Do Not Disturb On, Do Not Disturb Off.
- **Release:** 1.0+.

### Example

N represents the number to be deleted from the user's "Do Not Disturb Exception List". For example, when a user has DND turned on and the telephone number (408) 555-1234 in their "Do Not Disturb Exception List", dialing \*10\*4085551234# will remove this phone number from the list. Incoming calls from (408) 555-1234 will no longer be allowed through; instead they will hear busy tone or be redirected to voicemail if available.

- **Short Code:** \*11\*N#
- **Telephone Number:** N

- **Feature:** DoNotDisturbExceptionDel

## Extn Login

**Extn Login** allows a user who has been configured with a Login Code (User | Telephony | Supervisor Settings) to take over ownership of any extension. That user's extension number

becomes the extension number of the extension while they are logged. This is also known as 'hot desking'.

- Hot desking is not supported for H175 and J129 telephones.
- When used, the user will be prompted to enter their extension number and then their log in code. Login codes of up to 15 digits are supported with **Extn Login** buttons. Login codes of up to 31 digits are supported with **Extn Login** short codes.
- When a user logs in, as many of their user settings as possible are applied to the extension. The range of settings applied depends on the phone type and on the system configuration.
- By default, on 1400, 1600, 9400, 9500, 9600, and J100 Series phones, the user's call log and personal directory are accessible while they are logged in. This also applied to M-Series and T-Series telephones.
- On other types of phone, those items such as call logs and speed dials are typically stored locally by the phone and will not change when users log in and log out.
- If the user logging in was already logged in or associated with another phone, they will be automatically logged out that phone.

### Details

- **Telephone Number:** ✓ Extension Number\*Login Code. If just a single number is dialed containing no \* separator, the system assumes that the extension number to use is the physical extension's Base Extension number and that the number dialed is the log in code.
- **Default Short Code:** ✓ \*35\*N#
- **Programmable Button Control:** ✓ Login
- **See also:** Extn Logout.
- **Release:** 1.0+.

### Example: Individual Hot Desking

Based on the above sample short code, Paul (extension 204) can go to another phone (even if it is already logged in by another user) and log in as extension 204 by simply dialing 299. Once Paul has logged into this phone, extension 204 is logged out at Paul's original phone. For Paul to make use of this short code, his log in code must match that configured in the above short code. When Paul logs out of the phone he has "borrowed", his original extension will automatically be logged back in.

- **Short Code:** 299
- **Telephone Number:** 204\*1234
- **Feature:** Extnlogin

### Example: Log In

The default short code for logging into a phone is configured as shown below. N represents the users extension number followed by a \* and then their log in code, for example \*35\*401\*123#.

- **Short Code:** \*35\*N#
- **Telephone:** N

- **Feature:** ExtnLogin

#### Related links

## Follow Me Here

Causes calls to the extension number specified to be redirected to the extension initiating the 'Follow Me Here'. If the redirected call receives a busy tone or is not answered, then the call behaves as though the User's extension had failed to answer. For further details, see [Follow Me](#) on page 869.

### Details

**Telephone Number:** ✔ Extension to redirect to the dialing extension.

**Default Short Code:** ✔ \*12\*N#

**Programmable Button Control:** ✔ Here+

**See also:** Follow Me Here Cancel, Follow Me To.

**Release:** 1.0+.

### Example

This feature is used at the Follow Me destination. N represents the extension number of the user wanting their calls redirected to that destination. For example, User A's extension is 224. However

they are working at extension 201 and want their calls redirected there. If the following short code is available, they can do this by dialing \*12\*224# at extension 201.

- **Short Code:** \*12\*N#
- **Telephone Number:** N
- **Feature:** FollowMeHere

#### Related links

[Short Code Features](#) on page 997

---

## Follow Me Here Cancel

Cancels any Follow Me set on the specified extension. This action can only be performed at the extension to which the Follow Me Here is targeted. For further details, see [Follow Me](#) on page 869.

#### Details

- **Telephone Number:** ✓ Extension being redirected to the dialing extension.
- **Default Short Code:** ✓ \*13\*N#
- **Programmable Button Control:** ✓ Here-
- **See also:** Follow Me Here, Follow Me To.
- **Release:** 1.0+.

#### Example

This feature is used at the Follow Me destination. N represents the extension number of the user whose calls are being redirected to that destination. For example, User A's extension is 224. However they are working at extension 201 and so have set a Follow Me on their own extension to redirect their calls to 201. If the following short code is available, they can cancel the Follow Me by dialing \*13\*224# at extension 201.

**Short Code:** \*13\*N#

**Telephone Number:** N

**Feature:** FollowMeHereCancel

#### Related links

[Short Code Features](#) on page 997

---

## Follow Me To

Causes calls to the extension to be redirected to the Follow Me destination extension specified. For further details, see [Follow Me](#) on page 869.

### Details

- **Telephone Number:** ✓ Target extension number or blank (cancel Follow Me To)
- **Default Short Code:** ✓ \*14\*N#
- **Programmable Button Control:** ✓ FoTo
- **See also:** Follow Me Here, Follow Me Here Cancel.
- **Release:** 1.0+.

### Example

This feature is used at the extension that wants to be redirected. N represents the extension number to which the user wants their calls redirected. For example, User A's extension is 224. However they are working at extension 201 and want their calls redirected there. If the following short code is available, they can do this by dialing \*14\*201# at extension 224.

- **Short Code:** \*14\*N#
- **Telephone Number:** N
- **Feature:** FollowMeTo

## Forward Number

Sets the number to which the user's calls are redirected. This can be an internal or external number. The number is still subject to the user's call barring settings. For further details see Forward Unconditional.

This feature does not activate forwarding; it only sets the number for the forwarding destination.

This number is used for all forward types; Forward Unconditional, Forward on Busy and Forward on No Answer, unless the user has a separate Forward on Busy Number set for forward on busy and forward on no answer functions.

**Details**

- **Telephone Number:** ✔ Telephone number.
- **Default Short Code:** ✔ \*07\*N#
- **Programmable Button Control:** ✔ FwdNo

- **See also:** Forward On Busy Number.
- **Release:** 1.0+.

### Example

N represents the forward destination. For example, if extension 224 wants to set the forwarding number to extension 201, the user can dial \*07\*201#.

- **Short Code:** \*07N\*#
- **Telephone Number:** N
- **Feature:** ForwardNumber

### Related links

[Short Code Features](#) on page 997

## Group Listen On

Using group listen allows callers to be heard through the phone's handsfree speaker but to only hear the phone's handset microphone. When group listen is enabled, it modifies the handsfree functionality of the user's phone in the following manner

- When the user's phone is placed in handsfree/speaker mode, the speech path from the connected party is broadcast on the phone speaker but the phone's base microphone is disabled.
- The connected party can only hear speech delivered through the phone's handset microphone.

- Group listen is not supported for IP phones or when using a phone's **HEADSET** button.
- For T-Series and M- Series phones, this option can be turned on or off during a call. For other phones, currently connected calls are not affected by changes to this setting, instead group listen must be selected before the call is connected.

Group listen is automatically turned off when the call is ended.

#### Details

- **Telephone Number:** ✗
- **Default Short Code:** ✗
- **Programmable Button Control:** ✓ GroupListenOn
- **Release:** 4.1+.

## Hold Call

This uses the Q.931 Hold facility, and "holds" the incoming call at the ISDN exchange, freeing up the ISDN B channel. The Hold Call feature "holds" the current call to a slot. The current call is

always automatically placed into slot 0 if it has not been placed in a specified slot. Only available if supported by the ISDN exchange.

### Details

- **Telephone Number:** ✓ Exchange hold slot number or blank (slot 0).
- **Default Short Code:** ✗
- **Programmable Button Control:** ✓ Hold
- **See also:** Hold CW, Hold Music, Suspend Call.
- **Release:** 1.0+.

### Example

Below is a sample short code using the Hold Call feature. This short code is a default within the system configuration. N represents the exchange hold slot number you want to hold the call on. For example, while connected to a call, dialing \*24\*3# will hold the call onto slot 3 on the ISDN.

- **Short Code:** \*24\*N#
- **Telephone Number:** N
- **Feature:** HoldCall

## Hold CW

This uses the Q.931 Hold facility, and "holds" the incoming call at the ISDN exchange, freeing up the ISDN B channel. The Hold CW feature "holds" the current call to an exchange slot and answers the call waiting. The current call is always automatically placed into slot 0 if it has not been placed in a specified slot. Only available if supported by the ISDN exchange.

### Details

- **Telephone Number:** ✓ Exchange slot number or blank (slot 0).
- **Default Short Code:** ✓ \*27\*N# (A-Law only) (not on Server Edition)
- **Programmable Button Control:** ✓ HoldCW
- **See also:** Hold Call, Suspend Call.
- **Release:** 1.0+.

### Example

Below is a sample short code using the Hold CW feature.

- **Short Code:** \*27\*N#
- **Feature:** HoldCW

## Hold Music

This feature allows the user to check the system's music on hold. See Music On Hold for more information.

### Details

- **Telephone Number:** Optional. If no number is specified, the default system source is assumed. The system supports up to 4 hold music sources, numbered 1 to 4. 1 represents the System Source. 2 to 4 represent the Alternate Sources.
- **Default Short Code:** ✓
- **\*34N;** where N is the number of the hold music source required.
- **Programmable Button Control:** ✓ Music
- **Release:** 1.0+.

### Example

Below is a sample short code using the Hold Music feature. This short code is a default within the configuration.

- **Short Code:** \*34N;
- **Feature:** HoldMusic

## Hunt Group Disable

This feature disables the user's membership of the specified hunt group. They will no longer receive call to that hunt group until their membership is enabled again. To use this feature, you must already belong to the hunt group. See also Hunt Group Enable.

### Details

- **Telephone Number:** ✓ Group number.
- **Default Short Code:** ✗
- **Programmable Button Control:** ✓ HGDis
- **See also:** Hunt Group Enable.
- **Release:** 1.0+.

### Example

N represents the hunt group number from which the user wants to be disabled from. For example, if Paul wants to be disabled from the Sales hunt group (extn. 500), he needs to dial \*90\*500#.

- **Short Code:** \*90\*N#
- **Telephone Number:** N

- **Feature:** HuntGroupDisable

#### Related links

## Hunt Group Enable

This feature enables the user's membership of a hunt group so they can begin to receive calls to the specified hunt group. To use this feature, the user must already belong to the hunt group. This short code can not be used to add someone to a hunt group, that must be done within Manager's Hunt Group form.

#### Details

- **Telephone Number:** ✓ Group number.
- **Default Short Code:** ✗
- **Programmable Button Control:** ✓ HGE na
- **See also:** Hunt Group Disable.
- **Release:** 1.0+. Previously in Release 3.2 the **Set Hunt Group Night Service**, **Set Hunt Group Out of Service** and **Hunt Group Enable** short code features toggled. That behaviour is not supported in 4.0 and higher.

#### Example

This short code can be used to turn the feature on. N represents the hunt group number for which the user wants to start receiving calls. For example, if Paul is already a member of the sales hunt group (extrn. 500) but has changed his availability status for that hunt group using hunt group disable, he can make himself available for receiving calls to the Sales hunt group again by dialing \*91\*500#.

- **Short Code:** \*91\*N#
- **Telephone Number:** N
- **Feature:** HuntGroupEnable

## Outgoing Call Bar Off

Allows a user to switch off their outgoing call bar status. The short code user must enter their log in code, if set, in order to be successful.

If you add a short code using this feature to a system it is recommended that you also assign a login code to the No User user to prevent the short code being used to change the status of that user.

### Details

- **Telephone Number:** ✓ The user's log in code.  
- System phone users can use *<target user>\*<system phone user's login code>*.
- **Default Short Code:** ✗
- **Programmable Button Control:** ✗
- **Release:** 4.1+ (Added to Release 4.1 2008Q2 Maintenance release).

### Example

The user has a **Login Code** of **1234**. To use the short code below, the user must dial **\*59\*1234#**.

- **Short Code:** \*59\*N#
- **Telephone Number:** N
- **Feature:** Outgoing Call Bar Off.

### Example

A user set as a system phone can also switch off the Outgoing Call Bar status of another user. This is done using their own login code. For example the system phone 401 with login code 1234 can switch off the outgoing call bar status of extension 403 as follows:

- **\*59\*403\*1234**

## Private Call Off

Short codes using this feature turn off private call status for the user if set. The short code features Private Call and Private Call On can be used to turn private call on.

- When on, any subsequent calls cannot be intruded on until the user's private call status is switched off. The exception is Whisper Page which can be used to talk to a user on a private call.
- Note that use of private calls is separate from the user's intrusion settings. If the user's **Cannot be Intruded** (User | Telephony | Supervisor Settings) setting is enabled, switching private calls off does not affect that status. To allow private calls to be used to fully control the user status, **Cannot be Intruded** (User | Telephony | Supervisor Settings) should be disabled for the user.

### Details

- **Telephone Number:** ✗
- **Default Short Code:** ✗
- **Programmable Button Control:** Advanced | Call | Private Call.
- **Release:** 4.0+.

### Related links

## Private Call On

Short codes using this feature turn on the private call settings for the user regardless.

- When on, any subsequent calls cannot be intruded on until the user's private call status is switched off. The exception is Whisper Page which can be used to talk to a user on a private call.
- Note that use of private calls is separate from the user's intrusion settings. If the user's **Cannot be Intruded** (User | Telephony | Supervisor Settings) setting is enabled, switching private calls off does not affect that status. To allow private calls to be used to fully control the user status, **Cannot be Intruded** (User | Telephony | Supervisor Settings) should be disabled for the user.
- Private call status can be switched off using a short code with the Private Call Off feature or a programmed button set to the Private Call action. To enable private call status for a single following call only the Private Call short code feature should be used.

### Details

- **Telephone Number:** ✗
- **Default Short Code:** ✗

- **Programmable Button Control:** Advanced | Call | Private Call.
- **Release:** 4.0+.

## Priority Call

This feature allows the user to call another user even if they are set to 'do not disturb'. Priority calls to a user without DND will follow forwarding and follow me settings but will not go to voicemail.

#### Details

- **Telephone Number:** ✓ Extension number.
- **Default Short Code:** ✗
- **Programmable Button Control:** ✓ PCall
- **See also:** DialPhysicalExtensionByNumber, DialPhysicalNumberByID.
- **Release:** 1.0+.

#### Example

N represents the extension number to be called, despite the extension being set to 'do not disturb'. For example, if extension 201 has 'do not disturb' enabled, a user can dial \*71\*201# and still get through. This short code is useful for companies that frequently use the 'do not disturb' feature and can be given to Managing Directors or people who may need to get through to people regardless of their 'do not disturb' status.

- **Short Code:** \*71\*N#
- **Telephone Number:** N
- **Feature:** PriorityCall

## Record Message

This short code feature is used to record hunt group announcements on Embedded Voicemail, see Hunt Group | Announcements. Release 5.0+: It is also used to record mailbox user name prompts for the auto attendant **Dial by Name** function.

#### Details

- **Telephone Number:** ✓
  - For a hunt group queue announcement, use the hunt group extension number followed by ".1".

- For a hunt group still queue announcement, use the hunt group extension number followed by ".2".
- For a mailbox user name prompt, use the user extension number followed by ".3".
- **Default Short Code:** ✓ \*91N; and \*92N; (not on Server Edition)
- **Programmable Button Control:** ✗
- **Release:** 4.0+.

### Example

For a hunt group with extension number 300, the default short codes **\*91N;/Record Message/N".1"** and **\*92N;/Record Message/N".2"** can be used to allow recording of the announcements by dialing **\*91300#** and **\*92300#**.

To allow users to record their own name prompt, the short code **\*89#/Record Message/E."3"** can be used. The **E** is replace by the extension number of the dialing user.

## Relay On

This feature closes the specified switch in the system's external output (EXT O/P) port.

This feature is not supported on Linux based systems. For Server Edition, this option is only supported on Expansion System (V2) units.

### Details

- **Telephone Number:** ✓ Switch number (1 or 2).
- **Default Short Code:** ✓ \*39 (Switch 1), \*42 (Switch 2), \*9000\*.
- **Programmable Button Control:** ✓ Rely+
- **See also:** Relay Off, Relay Pulse.
- **Release:** 1.0+.

### Example

This short code is a default within the system configuration. This short code is useful for companies that have external devices, such as door controls, connected to the system. Based on this sample short code, a user dialing \*42 is closing switch number 2 to activate an external device.

- **Short Code:** \*42
- **Telephone Number:** 2
- **Feature:** RelayOn

### Analog Modem Control

On systems with an analog trunk card in the control unit, the first analog trunk can be set to answer V.32 modem calls. This is done by either selecting the Modem Enabled option on the

analog line settings or using the default short code \*9000\* to toggle this service on or off. This short code uses the **RelayOn** feature with the Telephone Number set to "MAINTENANCE". Note that the short code method is always returned to off following a reboot or if used for accessing the system date and time menu.

**IP500 ATM4 Uni Trunk Card Modem Support** It is not required to switch the card's modem port on/off. The trunk card's V32 modem function can be accessed simply by routing a modem call to the RAS service's extension number. The modem call does not have to use the first analog trunk, instead the port remains available for voice calls.

## Resume Call

Resume a call previously suspended to the specified ISDN exchange slot. The suspended call may be resumed from another phone/ISDN Control Unit on the same line.

### Details

- **Telephone Number:** ✔ Exchange suspend slot number.
- **Default Short Code:** ✔ \*23\*N# (A-Law only) (not on Server Edition)
- **Programmable Button Control:** ✔ Resum
- **See also:** Suspend Call.
- **Release:** 1.0+.

### Example

Below is sample short code using the Resume Call feature. N represents the exchange slot number from which the call has been suspended. For example, if a user has suspended a call on slot number 4, this user can resume that call by dialing \*23\*4#.

- **Short Code:** \*23\*N#
- **Telephone Number:** N
- **Feature:** ResumeCall

## Ring Back When Free

This feature sets a ringback on the specified extension. This sets a 'ringback when free' on an extension currently on a call or a 'ringback when next used' for an extension that is free but does not answer.

When the target extension is next used or ends its current call, the users is rung and when they answer a call is made to the target extension.

### Details

- **Telephone Number:** ✓ Target extension number.
- **Default Short Code:** ✗
- **Programmable Button Control:** ✓ RBak+
- **See also:** Cancel Ring Back When Free.
- **Release:** 1.0+.

### Example

N represents the target extension from which you want to receive the callback. For example, if you call extension 201 but the line is busy, hang up and then dial \*71\*201#. When extension 201

disconnects from its current call, your phone will ring. Once you pick up the phone, extension 201's line will start ringing to indicate an incoming call.

- **Short Code:** \*71\*N#
- **Telephone Number:** N
- **Feature:** RingBackWhenFree

## Secondary Dial Tone

Secondary dial tone is a system feature to generate a secondary dial tone after the user has begun dialing an external number. This dial tone is then played until the number dialing and an external trunk seized.

- Pre-Release 4.0: Secondary dial tone is triggered through the use of the secondary dial tone short code feature.
- Release 4.0+: The use of this short code feature has been replaced by the Secondary Dial Tone check box option on ARS forms.

#### Details

- **Telephone Number:** ✔ Digit which triggers secondary dial tone.
- **Default Short Code:** ✔ 9 (U-Law only)
- **Programmable Button Control:** ✖
- **Release:** 1.0+.

#### Example

For pre-4.0 systems secondary dial tone works in two parts. The following system short code will trigger secondary dial tone. To use it to trigger secondary dial tone and then continue dialing, other user, user rights and system short codes should begin with [9].

- **Short Code:** 9
- **Telephone Number:** .
- **Feature:** Secondary Dial Tone

## Set Absent Text

This feature can be used to select the user's current absence text. This text is then displayed to internal callers who have suitable display phones or applications. It doesn't changes the users

status. The absence text message is limited to 128 characters. Note however that the amount displayed will depend on the caller's device or application.

The text is displayed to callers even if the user has forwarded their calls or is using follow me. Absence text is supported across a multi-site network.

## Details

- **Telephone Number:** ✓ The telephone number should take the format "**y,n,text**" where:
  - **y** = 0 or 1 to turn this feature on or off.
  - **n** = the number of the absent statement to use, see the list below:

|                        |                          |                     |
|------------------------|--------------------------|---------------------|
| 0 = None.              | 4 = Meeting until.       | 8 = With cust. til. |
| 1 = On vacation until. | 5 = Please call.         | 9 = Back soon.      |
| 2 = Will be back.      | 6 = Don't disturb until. | 10 = Back tomorrow. |
| 3 = At lunch until.    | 7 = With visitors until. | 11 = Custom.        |

- **text** = any text to follow the absent statement.

- **Default Short Code:** ✗
- **Programmable Button Control:** ✓ Absnt
- **Release:** 1.0+.

## Example

The following short code can be used to turn an absent text message on:

- **Short Code:** \*88
- **Telephone Number:** "1,5,me on 208"
- **Line Group ID:** 0
- **Feature:** SetAbsentText

## Example

The following short code could be used to turn this facility off. In the Telephone Number the first 0 is used to turn this facility off and the second 0 is used to select the absent statement "None".

- **Short Code:** \*89
- **Telephone Number:** "0,0"
- **Line Group ID:** 0
- **Feature:** SetAbsentText

## Set Account Code

This short code feature is used to allow system users to enter a valid account code prior to making a phone call. Once this short code is set up, any existing account code in the system configuration can be used in conjunction with it.

This short code feature is essential for allowing analog phone users to enter account codes as they cannot enter account code through the phone during a call or after dial a number.

### Details

- **Telephone Number:** ✓ A valid account code.
- **Default Short Code:** ✗
- **Programmable Button Control:** ✓ Acct.
- **Release:** 2.1+.

### Example

In this example, N represents any valid account code. For the purpose of this example, we will imagine the account code to be 1234. Once this short code is created, a user can dial 11\*1234# to get a dial tone for dialing the restricted telephone number or the phone number needing to be tracked for billing purposes.

- **Short code:** 11\*N#
- **Telephone Number:** N
- **Feature:** SetAccountCode

## Set Hunt Group Night Service

This feature puts the specified hunt group into Night Service mode.

Setting and clearing hunt group night service can be done using either manual controls or using a system time profile. The use of both methods to control the night service status of a particular hunt group is not supported.

This function is not supported between systems in a multi-site network. It can only be used by a user currently logged onto the same system as hosting the hunt group.

### Details

- **Telephone Number:** ✓ Hunt group extension number. If left blank, the short code will affect all hunt groups of which the user is a member.
  - The **Set Hunt Group Night Service** and **Clear Hunt Group Night Service** short code and button features can be used to switch an SSL VPN service off or on respectively. The service is indicated by setting the service name as the telephone number or action data. Do not use quotation marks.
- **Default Short Code:** ✓ \*20\*N#
- **Programmable Button Control:** ✓ HGNS+
- **See also:** Set Hunt Group Out Of Service, Clear Hunt Group Night Service, Clear Hunt Group Out Of Service.
- **Release:** 1.0+.

### Example

This short code is a default within the system configuration. N represents the telephone number of the hunt group to be placed into "Night Service" mode. For example, when \*20\*201# is dialed, the hunt group associated with extension 201 will be placed into "Night Service" mode.

- **Short Code:** \*20\*N#
- **Telephone Number:** N
- **Feature:** SetHuntGroupNightService

## Set Inside Call Seq

This feature allows the user to select the ringing used on their analog extension for internal calls.

### Details

- **Telephone Number:** ✓ 0 to 10.
  - The number sets to the required ring pattern. See [Ring Tones](#) on page 779.
  - The numbering starts at 0 for Default Ring, 1 for Ring Normal, 2 for RingType1, and so on.
- **Default Short Code:** ✗
- **Programmable Button Control:** ✓ ICSeq
- **See also:** Set Ringback Seq, Set Inside Call Seq.
- **Release:** 1.0+.

### Example

This Short Code allows a user to change their inside call pattern. N represents the number corresponding to the Call Sequence the user wishes to choose.

- **Short Code:** \*80\*N#
- **Telephone Number:** N
- **Feature:** SetInsideCallSeq

## Set No Answer Time

This short code feature allows the user to change their No Answer Time (User | Telephony | Call Settings).

#### Details

- **Telephone Number:** ✔ Time in seconds.
- **Default Short Code:** ✗
- **Programmable Button Control:** ✔ NATim
- **See also:** Set Wrap Up Time.
- **Release:** 1.0+.

#### Example

This short code allows a user to change the length of time they have to answer the phone before it goes to divert or voicemail. N represents the number of seconds. For example, if a user wants to set the no answer time to 15 seconds, the following information needs to be entered: \*81\*15#.

- **Short Code:** \*81\*N#
- **Telephone Number:** N
- **Feature:** SetNoAnswerTime

## Set Outside Call Seq

This feature allows the user to select the ringing used on their analog extension for external calls.

#### Details

- **Telephone Number:** ✔ 0 to 10.
  - The number sets to the required ring pattern. See [Ring Tones](#) on page 779.
  - The numbering starts at 0 for Default Ring, 1 for Ring Normal, 2 for RingType1, and so on.

- **Default Short Code:** ✗
- **Programmable Button Control:** ✔ OCSeq
- **See also:** Set Ringback Seq, Set Outside Call Seq.
- **Release:** 1.0+.

### Example

This short code allows a user to change the ringing tone for an external call. N represents the number corresponding to the Call Sequence the user wishes to choose.

- **Short Code:** \*81\*N#
- **Telephone Number:** N
- **Feature:** SetOutsideCallSeq

### Related links

## Set Wrap Up Time

Allows users to change their Wrap-up Time (User | Telephony | Call Settings) setting.

- Other phones or applications monitoring the user's status will indicate the user as still being busy (on a call).
- Hunt group calls will not be presented to the user.
- If the user is using a single line set, direct calls also receive busy treatment. If the user is using a mutli-line set (multiple call appearances), direct calls to them will ring as normal.
- It is recommended that this option is not set to less than the default of 2 seconds. 0 is used to allow immediate ringing.
- For users set as an CCR Agent, the After Call Work Time (User | Telephony | Supervisor Settings) setting should be used.

### Details

- **Telephone Number:** ✓ Time in seconds.
- **Default Short Code:** ✗
- **Programmable Button Control:** ✓ WUTim
- **See also:** Set No Answer Time.
- **Release:** 1.0+.

### Example

N represents the number of seconds. For example, if a user wants to set her/his wrap up time to 8 seconds, this user would dial \*82\*5#. This short code is useful in a "call center" environment where users may need time to log call details before taking the next call. If set to 0 the user does not receive any calls. It is recommended that this option is not set to less than the default of 2 seconds.

- **Short Code:** \*82\*N#
- **Telephone Number:** N
- **Feature:** SetWrapUpTime

---

## Speed Dial

Each system directory and personal directory number stored in the configuration can be optionally assigned an index number. That index number can then be used by M-Series and T-Series phone users to dial the directory number. This short code feature allows the creation of short codes to perform the same function. However, the short code is diallable from any type of telephone extension on the system.

For example:

- If **Feature 0** is followed by a 3-digit index number in the range 000 to 999, the system directory record with the matching index number is dialed.
- If **Feature 0** is followed by \* and a 2-digit index number in the range 00 to 99, the personal directory record with the matching index number is dialed. Alternatively Feature 0 can be followed by 00# to 99#. Note: Release 10.0 allows users to have up to 250 personal directory entries. However, only 100 of those can be assigned index numbers.

**Details**

- **Telephone Number:** ✓ System directory entry index number (000 to 999) or personal directory entry index number (00 to 99).
- **Default Short Code:** ✗
- **Programmable Button Control:** ✗
- **Release:** 8.1.

**Example**

Using the example below, a user is able to dial \*0 and then either a 2 digit code for an indexed personal directory entry or a 3 digit code for an indexed system directory entry.

- **Short Code:** \*0N#
- **Telephone Number:** N
- **Feature:** Speed Dial

## Shutdown Embedded Voicemail

Allows the Embedded Voicemail service provided by an Avaya memory card in a control unit to be shut down. To restart the service, a **Startup Embedded Voicemail** short code should be used.

The short code has the following effects:

1. Immediately disconnect all current users within Embedded Voicemail. This is not a polite shutdown.
2. Mark the Embedded Voicemail as inactive so that it will not receive any new calls.

#### Details

- **Telephone Number:** ✗
- **Default Short Code:** ✗
- **Programmable Button Control:** ✗
- **Release:** 4.0+ (Added in the Release 4.0 Q2 2007 maintenance release).

#### Related links

[Short Code Features](#) on page 997

---

## Stamp Log

The stamp log function is used to insert a line into any System Monitor trace that is running. The line in the trace indicates the date, time, user name and extension plus additional information. The line is prefixed with **LSTMP: Log Stamped** and a log stamp number. When invoked from a Avaya phone with a display, **Log Stamped#** is also briefly displayed on the phone. This allows users to indicate when they have experienced a particular problem that the system maintainer want them to report and allows the maintainer to more easily locate the relevant section in the monitor trace.

The log stamp number is set to 000 when the system is restarted. The number is then incremented after each time the function is used in a cycle between 000 and 999. Alternately if required, a specific stamp number can be assigned to the button or short code being used for the feature.

#### Details

- **Telephone Number:** Optional. If not set, a number in the sequence 000 to 999 is automatically used. If set, the number set is used.
- **Default Short Code:** ✓ \*55
- **Programmable Button Control:** ✓ Stamp Log
- **Release:** 8.1+

# Unpark Call

Retrieve a parked call from a specified system park slot.

## Details

- **Telephone Number:** ✓ System park slot number.
- **Default Short Code:** ✓ \*38\*N#
- **Programmable Button Control:** ✓ Ride
- **See also:** Call Park.
- **Release:** 1.0+.

## Example

Below is a sample short code using the Unpark Call feature. N represents the park slot number in which the call you want to retrieve was parked. For example, if a user parked a call to slot number 9, you can retrieve that call by dialing \*38\*9#.

- **Short Code:** \*38\*N#
- **Telephone Number:** N
- **Feature:** Unpark Call

## Related links

[Short Code Features](#) on page 997

---

# Voicemail Collect

This feature connects to the voicemail system. The telephone number field is used to indicate the name of the mailbox to be accessed, for example "?Extn201" or "#Extn201".

- **?** indicates 'collect messages'.
- **#** indicates 'leave a message'. It also instructs the voicemail server to give a brief period of ringing before connecting the caller. This is useful if the short code is used for functions such as call transfers as otherwise the voicemail server can start playing prompts before the transfer is completed. However, the # can be omitted for immediate connection if required.

- " " quotation marks must be used to enclose any information that needs to be sent to the voicemail server as is. Any text not enclosed by quote marks is checked by the telephone system for short code character matches which will be replaced before being sent to the voicemail server.
  - Manager automatically adds quotation marks to the **Telephone Number** field if they are not added manually. Care should be taken to ensure that special characters that you want replaced by the telephone system, such as **U**, **N** or **X**, are not enclosed by the quotation marks. For scenarios where the telephone number only contains short code characters, add an empty pair of quotation marks, for example ""N.

When using Voicemail Pro, names of specific call flow start points can directly access those start points via a short code. In these cases, ? is not used and # is only needed if ringing is required before the start point's call flow begins.

Short codes using the **Voicemail Collect** feature, with either "Short Codes.name" and "#Short Codes.name" records in the **Telephone Number** field are automatically converted to the **Voicemail Node** feature and name.

CallPilot voicemail is used for IP Office Branch deployments with CS 1000. Users can access their CallPilot voicemail by dialing the **Voicemail Collect** short code. For access to CallPilot voicemail from an Auto Attendant, set a **Normal Transfer** action to point to the CallPilot number.

### Details

- **Telephone Number:** ✓ See the notes above.
- **Default Short Code:** ✓ \*17
- **Programmable Button Control:** ✓ VMCol
- **See also:** Voicemail On, Voicemail Off, Voicemail Node.
- **Release:** 1.0+.

### Example: Retrieve Messages from Specific Mailbox

This short code allows a user to retrieve messages from the mailbox of the hunt group 'Sales'. This usage is not supported on Voicemail Pro running in Intuity emulation mode unless a custom call flow has been created for the hunt group, refer to the Voicemail Pro help.

- **Short Code:** \*89
- **Telephone Number:** "?Sales"
- **Feature:** VoicemailCollect

### Example: Record Message to Specific Mailbox

To allow users to deposit a message directly to Extn201's Voicemail box. This short code is useful when you know the person is not at her/his desk and you want to immediately leave a message rather than call the person and wait to be redirected to voicemail.

- **Short Code:** \*201
- **Telephone Number:** "#Extn201"
- **Feature:** VoicemailCollect

### Example: Accessing a Specific Voicemail Pro Module

This short code can be used in instances where you have a conference bridge set up on the system and a module has been created via Voicemail Pro to access this conference bridge. A short code can be created for internal access to the module. In the sample short code below, the telephone number field contains the name of the module. In this example, if a short burst of ringing is required before connecting the module, "#conferenc" would be used as the telephone number.

- **Short Code:** \*100
- **Telephone Number:** "conferenc"
- **Feature:** VoicemailCollect

#### Related links

## Voicemail Ringback On

This feature enables voicemail ringback to the user's extension. Voicemail ringback is used to call the user when they have new voicemail messages. The ringback takes place each time the

extension is used. This feature is useful for users who do not have voicemail light/button indicators on their telephone.

If the user has been configured to receive message waiting indication for any hunt groups, a separate voicemail ringback will occur for each such group and for the users own mailbox.

### Details

- **Telephone Number:** ✗
- **Default Short Code:** ✔ \*48
- **Programmable Button Control:** ✔ VMRB+
- **See also:** Voicemail Ringback Off.
- **Release:** 1.0+. For Release 3.2, the Voicemail On and Voicemail Ringback On short code features toggled. For Release 4.0 and higher, they no longer toggle.

### Example

This short code can be used to turn the feature on.

- **Short Code:** \*48
- **Feature:** VoicemailRingbackOn

## Whisper Page

This feature allows you to intrude on another user and be heard by them without being able to hear the user's existing call which is not interrupted.

For example: User A is on a call with user B. When user C intrudes on user A, they can be heard by user A but not by user B who can still hear user A. Whisper page can be used to talk to a user who has enabled private call.

- Intrusion features are controlled by the **Can Intrude** setting of the user intruding and the **Cannot Be Intruded** setting of user being intruded on. By default, no users can intrude and all users cannot be intruded.

The system support a range of other call intrusion methods in addition to this feature.

### Details

- **Telephone Number:** ✓ Target extension number.
- **Default Short Code:** ✗
- **Programmable Button Control:** ✓ Whisp.
- **See also:** Call Intrude, Call Listen, Coaching Intrusion, Dial Inclusion.
- **Release:** 8.0+.

# Part 14: Button Programming

# Chapter 104: Button Programming Overview

This section provides an overview of system actions that can be assigned to programmable buttons on Avaya phones.

Button assignment can be done through the system configuration using IP Office Manager and IP Office Web Manager. If only button programming changes are required, the configuration changes can be merged back to the system without requiring a reboot.

Users can also do their own button programming using the user portal application or, on some phones, through the phone's menu. However, users can only program a limited set of functions and cannot override appearance buttons and buttons set through user rights templates.

- **Appearance Functions**

The functions **Call Appearance**, **Bridged Appearance**, **Coverage** and **Line Appearance** are collectively known as "appearance functions". For full details of their operation and usage, see [Appearance Buttons](#) on page 1202.

- **Phone Support**

Note that not all functions are supported on all phones with programmable buttons. Where possible exceptions, have been indicated. Those buttons will typically play an error tone when used on that phone. Programming of those features however is not restricted as users may hot desk between different types of phones, including some where the feature is supported.

- **Status Indication**

Actions that use status feedback are only supported on buttons that provide that feedback through lamps or icons.

# Programming Buttons with IP Office Web Manager

This process edits the programmable buttons for individual users.

- You can also use user rights to create a set of programmable buttons that are simultaneously applied to multiple users. See [Configuring User Rights](#) on page 862.

## Procedure

1. Use **Call Management > Users** to display the list of users.
2. Click the  icon next to the user you want to edit.
3. Select **Button Programming**.
4. The number of buttons displayed is based on the **Select Phone** settings. This defaults to matches the phone currently associated with the user. You can change the value or set it to **None** to display all the possible buttons. This may be necessary for users who switch between different phones using hot desking or have an expansion unit attached to their phone.
5. For the required button, click the  icon.
6. Add a label and select the required action. Additional options may appear depending on the action selected.
7. When completed, click **OK**.
8. Repeat for any other buttons.
9. Click **Update**.

## Related links

[Button Programming Overview](#) on page 1086

# Interactive Button Menus

For certain functions, on display phones where a button has been configured without a specific number, a menu for number entry is displayed. The menu includes a **Dir** option for selecting a number from the directories held by the system.

Functions that use the interactive menu are:

| Feature                 | Directory lists... | Feature               | Directory lists... |
|-------------------------|--------------------|-----------------------|--------------------|
| Automatic Intercom      | Users              | Follow Me Here Cancel | Users              |
| Acquire Call/Call Steal | Users              | Follow Me Here        | Users              |
| Call Forwarding All     | Users              | Follow Me To          | Users              |
| Call Intrude            | Users              | Forward Number        | Users/Groups       |

*Table continues...*

|                              |              |  |                     |              |
|------------------------------|--------------|--|---------------------|--------------|
| Call Park To Other Extension | Users        |  | Forward Busy Number | Users/Groups |
| Dial Inclusion               | Users        |  | Group Paging        | Users/Groups |
| Dial Intercom                | Users        |  | Leave Word Calling  | Users/Groups |
| Directed Call Pickup         | Users/Groups |  | Priority Calling    | Users/Groups |

User and Group buttons can be used to indicate the required user or hunt group only if those buttons are on an associated button module. **User** and **Group** buttons on the users extension are not accessible while the interactive button menu is being displayed.

For functions supported across a multi-site network, the directory will include remote users and advertised hunt groups.

For M-Series and T-Series phone, the volume buttons are used to scroll through the list of matching names. If this is done during a call or while a call is alerting, this will also adjust the call or ring volume.

[Button Programming Overview](#) on page 1086

# Chapter 105: Button Programming Actions

The following sections provide details for each of the button actions supported by system. Note that this does not include buttons on phones on a system running in Partner Edition mode.

For each, the following details are listed:

- **Action** - Indicates the selection path to the action from within the list of actions displayed in Manager.
- **Action Data** - Indicates the type of data required by the action. For some actions no data is required while for others action data may be optional. The option to enter the data after pressing the button is not available for all phones, see Interactive Button Menus.
- **Default Label** - This is the default text label displayed on phones which provide a display area next to programmable buttons. Alternate labels can be specified in the system configuration or entered by the phone user (refer to the telephone user guide). Note that for buttons with action data set, the action data may also be displayed as part of the default label. Depending on the display capacity of the particular phone, either a short or long label is displayed.
- **Toggles** - Indicates whether the action toggles between two states, typically on or off.
- **Status Indication** - Indicates whether the button provides status indication relevant to the feature if the button has status lamps or display. If the **Status Indication** is listed as **Required** it indicates that the button action is only supported on programmable buttons that can provide status indication.
- **User Admin** - This item indicates that users with a Self-Administer button can assign the action to other buttons themselves.
- **Phone Support** - This is only a general indication of support or otherwise of an action by phones within particular series. On phones with 3 or less programmable buttons those button can only be used for the Call Appearance action. In addition some actions are only supported on phones where the programmable buttons provide status indication and or a display for data entry once the feature is invoked.

---

## Button Programming Actions Summary

The following tables list the actions available for programmable buttons on system.

-  **Login Code Required** Some function may require the user to enter their log in code. This typically applies when the action data is left blank for entry when the button is pressed.

## General

| Action | Action Data                  | Default Label |
|--------|------------------------------|---------------|
| Dial   | Any number.                  | Dial          |
| Group  | "Group name" in quote marks. | <Group name>  |
| User   | "User name" in quote marks.  | <User name>   |

## Appearance

| Action              | Action Data                                  | Default Label                 |
|---------------------|----------------------------------------------|-------------------------------|
| Appearance          | None.                                        | <b>a=</b>                     |
| Bridged Appearance  | User name and call appearance button number. | <user name><appearance label> |
| Coverage Appearance | User name.                                   | <user name>                   |
| Line Appearance     | Line appearance ID.                          | <b>Line</b>                   |

## Emulation

| Action                   | Action Data                                                    | Short Label  | Long Label              |
|--------------------------|----------------------------------------------------------------|--------------|-------------------------|
| Abbreviated Dial         | Any number.                                                    | <b>AD</b>    | <b>Abbreviate Dial</b>  |
| Abbreviated Dial Pause   | None.                                                          | <b>Pause</b> | –                       |
| Abbreviated Dial Program | None.                                                          | <b>Prog</b>  | –                       |
| Abbreviated Dial Stop    | None.                                                          | <b>Stop</b>  | –                       |
| Absent Message           | None.                                                          | None.        | None.                   |
| Account Code Entry       | Account code or blank for entry when pressed.                  | <b>Acct</b>  | <b>Account Code</b>     |
| ACD Agent Statistics     | None.                                                          | <b>Stats</b> | –                       |
| ACD Stroke Count         | None.                                                          | <b>Count</b> | –                       |
| AD Special Function Mark | None.                                                          | <b>Mark</b>  | –                       |
| AD Special Function Wait | None.                                                          | <b>Wait</b>  | –                       |
| AD Special Functions     | None.                                                          | <b>Sfunc</b> | –                       |
| AD Suppress              | None.                                                          | <b>Spres</b> | <b>Suppress Digits</b>  |
| Automatic Callback       | None.                                                          | <b>AutCB</b> | <b>Auto Callback</b>    |
| Automatic Intercom       | User number or name.                                           | <b>lauto</b> | <b>Auto Intercom</b>    |
| Call Forwarding All 📞    | Any number or blank for entry when pressed.                    | <b>CFrwd</b> | <b>Call Forward All</b> |
| Call Park                | Park slot ID (alphanumeric) or blank for menu of slots in use. | <b>CPark</b> | <b>Call Park</b>        |

---

## Abbreviated Dial

This function allows quick dialing of a stored number.

### Details

- **Action:** Emulation | Abbreviated Dial.
- **Action Data:**
  - **Full Number** The number is dialed.
  - **Partial Number** The partial number is dialed and the user can then complete dialing the full number.
- **Default Label:** AD or Abbreviate Dial.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** Yes.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.

- 1400 Series and 1600 Series.
- M-Series and T-Series.

---

## Abbreviated Dial Pause

Supported for CTI emulation only.

Allows a user to enter a pause character when programming an abbreviated dial.

### Details

- **Action:** Emulation | Abbreviated Dial Pause.
- **Action Data:** None.
- **Default Label:** Pause.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Abbreviated Dial Program

Supported for CTI emulation only.

Allows a user to program abbreviated dialing numbers against other programmable buttons. This function cannot be used to overwrite call appearance buttons.

### Details

- **Action:** Emulation | Abbreviated Dial Program.
- **Action Data:** None.
- **Default Label:** Prog.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** Yes.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Abbreviated Dial Stop

Supported for CTI emulation only.

Allows a user to enter a stop character when programming an abbreviated dial.

### Details

- **Action:** Emulation | Abbreviated Dial Stop.
- **Action Data:** None.
- **Default Label:** Stop.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Absent Message

This feature allows to select the user's current absence text. See [Set Absent Text](#) on page 1179.

---

## Account Code Entry

Enter an account code for a call. This button can be used before dialing a number or during a call.

### Details

- **Action:** Emulation | Account Code Entry.
- **Action Data:** Optional. If an code is set it must match an account code set in the account codes list. If no account code is set, the phone display will request entry of a valid code. This option is not supported on XX02 phones and the T7000 phone.
- **Default Label:** Acct or Account Code.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** Yes.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.

- 1400 Series and 1600 Series.
- M-Series and T-Series.
- 1100 Series and 1200 Series.

---

## ACD Agent Statistics

Supported for CTI emulation only.

### Details

- **Action:** Emulation | ACD Agent Statistics.
- **Action Data:** None.
- **Default Label:** Stats.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## ACD Stroke Count

Supported for CTI emulation only.

### Details

- **Action:** Emulation | ACD Stroke Count.
- **Action Data:** None.
- **Default Label:** Count.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** Yes.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Acquire Call

See [Call Steal](#) on page 1121.

---

## AD Special Functions

Supported for CTI emulation only.

Allows a user to enter a special character (mark, pause suppress, wait) when entering an abbreviated dial.

### Details

- **Action:** Emulation | AD Special Functions.
- **Action Data:** None.
- **Default Label:** Sfunc.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## AD Special Function Mark

Supported for CTI emulation only.

Allows a user to enter a mark character when programming abbreviated dial.

### Details

- **Action:** Emulation | AD Special Function Mark.
- **Action Data:** None.
- **Default Label:** Mark.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.

- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## AD Special Function Wait

Supported for CTI emulation only.

Allows a user to enter a Wait for Dial Tone character when programming an abbreviated dial.

### Details

- **Action:** Emulation | AD Special Function Wait.
- **Action Data:** None.
- **Default Label:** Wait.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## AD Suppress

Suppresses the display of dialed digits on the telephone display. Dialed digits are replaced with an s character.

### Details

- **Action:** Emulation | AD Suppress.
- **Action Data:** None.
- **Default Label:** Spres or Suppress Digits.
- **Toggles:** Yes.
- **Status Indication:** Yes.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                  | T-Series,                                                                                |

- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.

---

## After Call Work

This button is used by users configured as a Customer Call Reporter (CCR) Agent (**User | Telephony | Supervisor Settings**) and working with the CCR application. It shows the CCR agent their current After Call Work (ACW) status and allow them to manually change status. While in ACW state, the agent will not receive hunt group calls.

CCR Agents can be automatically put into and taken out of ACW by the system if the user is configured for Automatic After Call Work (User | Telephony | Supervisor Settings). Those users must have an **After Call Work** button.

### Note:

CCR is not supported in IP Office release 9.1 and later.

### Details

- **Action:** Advanced | Miscellaneous | After Call Work
- **Action Data:** None.
- **Default Label:** ACWrk or After Call Work.
- **Toggles:** Yes.
- **Status Indication:** Yes. Required.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                  | T-Series,                                                                                |
|--------|------------------------|------------------|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| On     | Green on               | Green on         |  Green |  On |
| Off    | Off                    | Off              |  Grey  | Off                                                                                      |

- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - 1100 Series and 1200 Series.

---

## Appearance

Creates a call appearance button. This can be used to answer and make calls. Users with multiple call appearance buttons can handle multiple calls. For details, see [Call Appearance Buttons](#) on page 1204.

Call appearance functions, assigned to buttons that do not have status lamps or icons, are automatically disabled until the user logs in at a phone with suitable buttons.

Appearance buttons can be set with a ring delay if required or to not ring. This does not affect the visual alerting displayed next to the button. The delay uses the user's **Ring Delay (User > Telephony > Multi-line Options)** setting.

### Details

- **Action:** Appearance | Appearance.
- **Action Data:** Optional text label.
- **Default Label:** a=.
- **Toggles:** No.
- **Status Indication:** Yes, required.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

### Virtual Call Appearances

T7000, T7100, M7100 and M7100N phones support virtual call appearance button operation. Virtual call appearance operation is similar to an analog phone with call waiting enabled. However, it does not use the call waiting on/off settings, instead it uses call appearance buttons.

The number of virtual call appearances is set by the call appearance buttons programmed in the user's settings. These must be programmed as a single block start from button 1. It is recommended that only a maximum of 3 call appearances are used, however the user must have at least 1 call appearance programmed in order to make and receive calls.

#### Virtual Call Appearance Usability

If the user goes off-hook, they are connected to the alerting call if any, else to dial tone in order to make an outgoing call. This uses one of their virtual call appearance buttons.

With a call connected:

- If another call arrives on another virtual call appearance, the user will hear a call waiting tone on the set. The display, if the phone has one, will switch between details of the current and the waiting caller.
- If the user presses **Hold**, the connected call is placed on hold and:

If there are any available virtual call appearances, dial tone is heard. This allows the user to make a call or to use short codes that may affect the held or waiting calls. The following are some of the default short codes that can be used:

- **\*26: Clear CW** Drop the previous call and answer the waiting call.
- **\*52: Clear Call** Drop the previous call.
- **\*47: Conference Add** Start a conference between the user and any held calls.
- Else, if there is a call waiting, that call is answered.
- Else, if there is a call on hold, that call is reconnected.

If the user presses **Release** or **Drop** or goes on-hook during a call, the current call is ended and the user's phone returns to idle. If there is a waiting call, it starts ringing. The user can answer the call by going off hook or pressing **Hold**.

With the phone idle:

If the user goes off hook:

- The first alerting call appearance is answered if any.
- Else, the first idle call appearance is seized and the user hears dial tone.
- The user can press **Hold** to switch between virtual call appearances. This will answer or retrieve any call on next virtual call appearance or else hear dial tone to make a call.

With the phone idle but a call alerting:

Going off-hook or pressing **Hold** will answer the call.

When all the users virtual call appearances are in use, they are busy to any further calls. Calls will follow forward on busy if set, else go to voicemail if available or else get busy indication.

The only other appearance button controls applied and supported are

**Reserve Last CA** This setting can be enabled for the extension user. When selected, the last available call appearance is reserved for outgoing calls only. For example, for a user with 3 call appearances, they return busy to any further calls when 2 virtual appearances are in use. The extension user can press hold to get dial tone on the reserved call appearance. An available call appearance is also required when using **Feature 70** to initiate a call transfer.

**Coverage Appearances** Other users can have Coverage Appearance buttons set to provided coverage to the virtual call appearance user. The virtual appearance users **Individual Coverage Time** setting is applied.

---

## Automatic Callback

Sets a ringback on the extension being called. When the target extension ends its current call, the ringback user is rung (for their set **No Answer Time**) and if they answer, a new call is made to the target extension.

Ringback can also be cleared using the Cancel Ring Back When Free function.

## Details

- **Action:** Emulation | Automatic Callback.
- **Action Data:** None.
- **Default Label:** AutCB or Auto Callback.
- **Toggles:** Yes.
- **Status Indication:** Yes.

  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Automatic Intercom

Automatic intercom functions allow you to call an extension and have the call automatically answered on speaker phone after 3 beeps. The extension called must support a handsfree speaker. If the extension does not have a handsfree microphone then the user must use the handset if they want to talk. If the extension is not free when called, the call is presented as a normal call on a call appearance button if available.

This feature can be used as part of handsfree announced transfers.

### Details

- **Action:** Emulation | Automatic Intercom.
- **Action Data:** User number or name. This field can be left blank for number entry when pressed. On large display phones, if configured without a preset target, this type of button will display an interactive button menu for target selection.
- **Default Label:** lauto or Auto Intercom.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Break Out

This feature is usable within a system multi-site network. It allows a user on one system in the network to specify that the following dialing be processed by another system on the network as if the user dialed it locally on that other system.

On phones with a multi-line display, if the target system is not specified in the button settings, a menu of the available systems in the network is displayed from which a selection can be made.

## Details

- **Action:** Advanced | Dial | Break Out.
- **Action Data:** Optional. The system name or IP address of the required system can be specified. If no system name or IP address is set, on display phones a list of systems within the network is displayed when the button is pressed.
- **Default Label:** BkOut or Breakout.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.

---

## Bridged Appearance

Creates an appearance button that follows the state of another user's call appearance button. The bridged appearance can be used to make and answer calls on behalf of the call appearance user. For details, see [Bridged Appearance Buttons](#) on page 1209.

The bridged appearance button user must also have at least one call appearance button programmed.

Bridged appearance functions, assigned to buttons that do not have status lamps or icons, are automatically disabled until the user logs in at a phone with suitable buttons.

Appearance buttons can be set with a ring delay if required or to not ring. This does not affect the visual alerting displayed next to the button. The delay uses the user's **Ring Delay (User > Telephony > Multi-line Options)** setting.

## Details

- **Action:** Appearance | Bridged Appearance.
- **Action Data:** User name and call appearance button number.
- **Default Label:** <user name><call appearance label>.
- **Toggles:** No.
- **Status Indication:** Yes. Required.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.

- 1400 Series and 1600 Series.
- M-Series and T-Series.
  1. Not supported on T7000, T7100, M7100 and M7100N.

---

## Busy

Not used.

---

## Busy On Held

When on, busy on held returns busy to new calls while the user has an existing call on hold. While this feature can be used by users with appearance keys, it is not recommended as this overrides the basic call handling intent of appearance keys.

### Details

- **Action:** Advanced | Busy | Busy on Held.
- **Action Data:** 1 for on, 0 for off.
- **Default Label:** BusyH.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Call Forwarding All

Switches forward unconditional on and sets the forward number to the number specified or prompts the user to enter a number if none is specified.

### Details

- **Action:** Emulation | Call Forwarding All.
- **Action Data:** Telephone number or blank for entry when pressed.
  - If blank, user's with a log in code will be prompted to enter that code to use this function.
  - On large display phones, if configured without a preset target, this type of button will display an interactive button menu for target selection.

- **Default Label:** CFrwd or Call Forward All.
- **Toggles:** Yes.
- **Status Indication:** Yes.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                | T-Series,                                                                              |
|--------|------------------------|------------------|-------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| On     | Green on               | Green on         |  Green |  On |
| Off    | Off                    | Off              |  Grey  | Off                                                                                    |

- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - 1100 Series and 1200 Series.

---

## Call Intrude

This feature allows you to intrude on the existing connected call of the specified target user. All call parties are put into a conference and can talk to and hear each other. A **Call Intrude** attempt to a user who is idle becomes a Priority Call.

- Intrusion features are controlled by the **Can Intrude** setting of the user intruding and the **Cannot Be Intruded** setting of user being intruded on. By default, no users can intrude and all users cannot be intruded.
- Intrusion features uses system conference resources during the call. If insufficient conference resource are available, the feature cannot be used.
- Users can use privacy features to set a call cannot be intruded on and recorded.
- Intruding onto a user doing silent monitoring (see [Call Listen](#) on page 1004) is turned into a silent monitoring call.

The system support a range of other call intrusion methods in addition to this feature.

### Details

- **Action:** Advanced | Call | Call Intrude.
- **Action Data:** User number or blank for entry when pressed. On large display phones, if configured without a preset target, this type of button will display an interactive button menu for target selection.
- **Default Label:** Intru or Intrude.
- **Toggles:** No.

- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Call Listen

This feature allows you to monitor another user's call without being heard.

- By default, monitoring is accompanied by a tone heard by all parties. Use of the tone is controlled by the **Beep on Listen** setting on the **System > Telephony > Tones and Music** tab.

### Warning:

- Listening to a call without the other parties being aware is subject to local regulations. You must ensure that you have complied with the local regulations. Failure to do so can result in penalties.

The use of call listen is dependent on:

- The target being a member of the group set as the user's **Monitor Group (User > Telephony > Supervisor Settings)**. The user does not have to be a member of the group.
- Intrusion features are controlled by the **Can Intrude** setting of the user intruding and the **Cannot Be Intruded** setting of user being intruded on. By default, no users can intrude and all users cannot be intruded.
- Intrusion features uses system conference resources during the call. If insufficient conference resource are available, the feature cannot be used.

A number of features are supported for call listening:

- Users can use privacy features to set a call cannot be intruded on and recorded.
- IP extensions can be monitored including those using direct media.
- The monitoring call can be initiated even if the target user is not currently on a call and remains active until the monitoring user clears the monitoring call.
- The user who initiated the call listen can also record the call.

Intruding onto an a user doing silent monitoring (Call Listen) is turned into a silent monitoring call.

1400, 1600, 9400, 9500, and 9600 Series phones with a user button can initiate listening using that button if the target user meets the criteria for listening.

The system support a range of other call intrusion methods in addition to this feature.

### Details

- **Action:** Advanced | Call | Call Listen.
- **Action Data:** User number.
- **Default Label:** Listn or Listen.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Call Log

This function provides access to a list of received calls.

### Details

- **Action:** Advanced | Call | Call Log.
- **Action Data:** None.
- **Default Label:** Call Log.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - M-Series and T-Series.

---

## Call Park

Users can use a button set to this action to park and unpark calls.

- Pressing the button whilst on a call will park that call.
  - Whilst parked, the caller hears music-on-hold if available.
  - The system **Park Timeout (secs)** setting (**System > System > Telephony**) controls how long calls remain parked. When this expires, the call recalls to the user who parked it if

they are idle or when they next become idle. The recall call rings continuously and does follow any forwards or go to voicemail.

- Pressing the button whilst not on a call displays details of any other calls the user has parked and allows call retrieval.

You can configure a call park button with or without a park slot number:

- **When associated with a specific park slot number:**

The button will park and unpark a call from that park slot only. The button indicates when someone has parked a call using that park slot number.

- **When not associated with a specific park slot number:**

The button can park up to 10 calls by assigning each parked call a park slot number based on the user's extension number. For example, for extension XXX, the first parked call is assigned to park slot XXX0, the next to XXX1 and so on up to XXX9. The button will indicate when there are parked calls in any of those slots.

Park buttons on other phones and in applications (for example IP Office SoftConsole and Avaya one-X Portal) with the same park slot number as a parked call will indicate the park call and can be used to retrieve it.

## Details

- **Action:** Emulation > Call Park
- **Action Data:** Either blank or a specific park slot number.
  - Park slot IDs can be up to 15 digits in length.
  - You can use names for application park slots.
- **Default Label:** CPark or Call Park.
- **Toggles:** ✓.
- **Status Indication:** ✓.

| Status                           | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                  | T-Series, M-Series                                                                               |
|----------------------------------|------------------------|------------------|---------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| - Calls parked by extension      | Green flash            | Green flash      |  Blue  |  Slow flash |
| - Call Parked by other extension | Red flash              | Red flash        |  Green |  Slow flash |
| - No parked calls                | Off                    | Off              |  Gray  | Off                                                                                              |

- **User Admin:** Yes.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.

- M-Series and T-Series.

1. The button is equivalent to **Feature 74**.

---

## Call Park and Page

Parks the user's current call into the park slot number specified on the **System | Telephony | Park & Page** tab, in the **Central Park Range** field.

On M/T-series phones, 14xx/16xx phones, and the 9504 phone, the user is presented with up to three Page Target Groups. On other 95xx/96xx phones, the Page action displays a scrolling list of possible Page Target Groups. The user may also directly enter a Page target number, or use the system Directory to find a Page target.

A call Parked within the Central Park Range (regardless of the origin of the Park action) can be retrieved by directly dialing the desired Central Park Range slot on which that call is Parked.

### Details

- **Action:** Emulation | Call Park and Page.
- **Action Data:** None.
- **Default Label:** ParkPage
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** Yes.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - 1. **Feature 74** is equivalent to this button when a Central Park Range is defined. On an M7000 phone, if this feature is invoked, the call always attempts to Park on the highest defined Central Park Range slot. See the Call Park and Page short code description for details.
  - 1100 Series and 1200 Series.

---

## Call Park To Other Extension

Allows the user to park their current call against another user's extension. The parked call indication on that extension is then activated according to the telephone type.

If the target extension has a Call Park button with no specific park slot number, the parked call will be indicated by that button and can be unparked from the list of parked calls shown when that button is pressed.

The park slot number assigned to the parked call is based on the number of the extension parking the call. For example, calls parked by extension 201 are assigned the park slot ID 2010, 2011 and so on up to 2019 depending on the number of calls parked.

### Details

- **Action:** Emulation | Call Park To Other Extension.
- **Action Data:** User number. This field can be left blank for number entry when pressed. On large display phones, if configured without a preset target, this type of button will display an interactive button menu for target selection.
- **Default Label:** RPark or Call Park to Other.
- **Toggles:** Yes .
- **Status Indication:** Yes. This is the status indication on the extension parking the call.

| Status         | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                               | T-Series, M-Series                                                                             |
|----------------|------------------------|------------------|------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| Parked call    | Green flash            | Green flash      |  Blue |  Slow flash |
| No parked call | Off                    | Off              |  Grey | Off                                                                                            |

- **User Admin:** Yes.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Call Pickup

Answer an alerting call on the system.

### Details

- **Action:** Emulation | Call Pickup.
- **Action Data:** None.
- **Default Label:** CpkUp or Call Pickup Any.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** Yes.

- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Call Pickup Any

Pick up the first available ringing call on the system.

### Details

- **Action:** Advanced | Call | Call Pickup Any.
- **Action Data:** None.
- **Default Label:** PickA or Pickup Any.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - 1100 Series and 1200 Series.

---

## Call Pickup Group

Pick up a call ringing any hunt group of which the user is a member or set to pick up calls from a specific group.

The user can use this feature even if their membership of the group is currently set as disabled.

### Details

- **Action:** Advanced | Call | Call Pickup Group.
- **Action Data:** Optional. To pick up calls from a specific group, use the group number or name.
- **Default Label:** PickG or Pickup Group.
- **Toggles:** No.

- **Status Indication:** No.
  - **User Admin:** No.
  - **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
    - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
    - 1400 Series and 1600 Series.
    - M-Series and T-Series.
1. The button is equivalent to **Feature 75**.

---

## Call Pickup Members

This feature can be used to pick up any call to an extension that is a member of the hunt group specified. The call picked up does not have to be a hunt group call. The function includes group members even if their membership of the group is currently disabled.

### Details

- **Action:** Advanced | Call | Call Pickup Members.
- **Action Data:** Group number or name.
- **Default Label:** PickM or Pickup Members.
- **Toggles:** No.
- **Status Indication:** Yes (*11.1 SP1*)
  - On suitable phones, pressing the button displays a list of any group member with a call waiting to be answered. Pressing the button next to the user name answers their call.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Call Queue

Transfer the call to the target extension if free or busy. If busy, the call is queued to wait for the phone to become free. This is similar to transfer except it allows you to transfer calls to a busy phone.

### Details

- **Action:** Advanced | Call | Call Queue.
- **Action Data:** User number.
- **Default Label:** Queue.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - 1100 Series and 1200 Series.

---

## Call Record

This feature allows you to record a conversation and requires Voicemail Pro to be installed.

- An advice of recording warning will be given if configured on the voicemail system.
- The recording is placed in the mailbox specified by the user's **Manual Recording Mailbox** setting.
- Intrusion features uses system conference resources during the call. If insufficient conference resource are available, the feature cannot be used.
- Users can use privacy features to set a call cannot be intruded on and recorded.

### Details

- **Action:** Advanced | Call | Call Record.
- **Action Data:** None.
- **Default Label:** Recor or Record.
- **Toggles:** Yes.
- **Status Indication:** Yes.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.

- M-Series and T-Series.
- 1100 Series and 1200 Series.
- This button action is also supported by the Vantage Connect Expansion application.

---

## Call Screening

This function is used to enable or disable call screening. While enabled, when a caller is presented to the user's voicemail mailbox, if the user's phone is idle they will hear through the phone's handsfree speaker the caller leaving the message and can select to answer or ignore the call.

This feature can be used with both Embedded Voicemail and Voicemail Pro. Call screening is only applied as follows:

- It is only applied to calls that have audible alerted at the user's extension before going to voicemail. This requires the user to have both voicemail coverage and call screening enabled and the phone's ringer not set to silent. However it is not applied if the user transfers the call to voicemail.
- It is only applied if the user's phone is idle. That is, not on a call or with a call held pending transfer or conference.
- Calls that ring the user, are then rerouted (for example follow a forward on busy setting) and then return to the user's mailbox are screened.

While a call is being screened, the phone can be used to either answer or ignore the screened call. Auto answer options are ignored.

### Answering a screened call

A screened call can be answered by pressing the **Answer** soft key (if displayed) or lifting the handset. Pressing the call appearance or line button on which the call is indicated will also answer the call.

When answered:

- The phone's microphone is unmuted and a normal call between the user and caller now exists.
- The voicemail recording stops but that portion of the call already recorded is left as a new message in the user's mailbox.

### Ignoring a screened call

A screened call can be ignored by pressing the Ignore soft key if displayed. On 1400, 1600, 9400, 9500, and 9600 Series phones, pressing the **SPEAKER** button will ignore the call. On M-Series and T-Series phones, pressing the **Release** key will ignore the call.

When ignored:

- The call continues to be recorded until the caller hangs up or transfers out of the mailbox.
- The user's phone returns to idle with call screening still enabled. However any other call that has already gone to voicemail is not screened.

## Screened call operation

While a call is being screened:

- The mailbox greeting played and the caller can be heard on the phone's speakerphone. The caller cannot hear the user.
- The user is regarded as being active on a call. They will not be presented with hunt group calls and additional personal calls use abbreviated ringing.
- 1400/1600/9400/9500/9600 Series phones: If the phone's default audio path is set to headset or the phone is idle on headset, then the screened call is heard through the headset.
- Any additional calls that go to the user's mailbox when they are already screening a call, remain at the mailbox and are not screened even if the existing call being screened is ended.
- Making or answering another call while listening to a screened call is treated as ignoring the screened call. For users with **Answer Pre-Select** enabled (User | Telephony | Multi-line Options), pressing an appearance button to display details of a call is also treated as ignoring the screened call.
- Other users cannot access a call that is being screened. For example they cannot use call pickup, bridged appearance or line appearance buttons, call intrude or call acquire functions.
- Phone based administration cannot be accessed and the hold, transfer and conference buttons are ignored.
- The screened caller using DTMF breakout ends the call screening.

Enabling do not disturb overrides call screening except for calls from numbers in the user's do not disturb exceptions list.

Locking the phone overrides call screening.

Manual call recording cannot be applied to a call being screened.

While a call is being screened, it uses one of the available voicemail channels. If no voicemail channels are available, call screening does not occur.

### **Warning:**

The use of features to listen to a call without the other call parties being aware of that monitoring may be subject to local laws and regulations. Before enabling the feature, you must ensure that you have complied with all applicable local laws and regulations. Failure to do so may result in severe penalties.

### Details

- **Action:** Advanced | Call | Call Screening.
- **Action Data:** None.
- **Default Label:** CallScreen or Call Screening.

    1. Not T7406E.

---

## Call Steal

This function allows a user to seize a call answered or ringing on another extension. This function can be used with or without a specified user target.

- If the target has multiple alerting calls, the function steals the longest waiting call.
- If the target has a connected call and no alerting calls, the function steals the connected call. This is subject to the **Can Intrude** setting of the **Call Steal** user and the **Cannot Be Intruded** setting of the target.
- If no target is specified, the function attempts to reclaim the user's last ringing or transferred call if it has not been answered or gone to voicemail.
- Stealing a video call changes the call to an audio call.
- R11.1 FP2 SP4 and higher: The shortcode for this feature can be used with the user's own extension number. That enables twinned and simultaneous device users to move a connected call from another one of their devices. This usage ignores the user's privacy and intrusion settings.

### Details

- **Action:** Advanced | Call | Call Steal.
- **Action Data:**
  - User number or blank for last call transferred.
- **Default Label:** Acquir or Acquire.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.

- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Call Waiting Off

Switches call waiting off for the user. This button function is obsolete. The Call Waiting On button function toggles on/off and indicates current status.

### Details

- **Action:** Advanced | Call | Call Waiting Off.
- **Action Data:** None.
- **Default Label:** CWOFF.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Call Waiting On

Enables call waiting on the user's extension. When the user is on a call and another call arrives, they will hear a call waiting tone.

### **Note:**

Call waiting does not operate for user's with call appearance buttons. See Call Waiting.

### Details

- **Action:** Advanced | Call | Call Waiting On.
- **Action Data:** None.
- **Default Label:** CWOOn or Call Waiting On.
- **Toggles:** Yes.
- **Status Indication:** Yes.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                | T-Series,                                                                              |
|--------|------------------------|------------------|-------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|

| Off    | Off                    | Off              |  Grey  | Off                                                                                    |

- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Call Waiting Suspend

Disables call waiting, if on, for the duration of the extension's next call.

### Details

- **Action:** Advanced | Call | Call Waiting Suspend.
- **Action Data:** None.
- **Default Label:** CWSus.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Cancel All Forwarding

Cancels forward unconditional, forward on busy, forward on no answer, follow me and do not disturb if any of those are active on the user's extension.

- **Action:** Advanced | Call | Cancel All Forwarding.
- **Action Data:** None.
- **Default Label:** FwdOf or Call Forward Off.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.

- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.

#### Details

- 9400 Series, 9500 Series, 9600 Series, and J100 Series.
- 1400 Series and 1600 Series.
- M-Series and T-Series.
- This button action is also supported by the Vantage Connect Expansion application.

---

## Cancel Leave Word Calling

Supported for CTI emulation only.

Cancels the last Leave Word Calling message originated by the user.

#### Details

- **Action:** Emulation | Cancel Leave Word Calling.
- **Action Data:** None.
- **Default Label:** CnLWC.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Cancel Ring Back When Free

Cancels any existing ring back set by the user, see Ring Back When Free. Note that the Ring Back When Free button toggles to set or cancel ring back when free and also indicates the current status.

#### Details

- **Action:** Advanced | Miscellaneous | Cancel Ring Back When Free.
- **Action Data:** None.
- **Default Label:** RBak-.
- **Toggles:** No.

- **Status Indication:** No.
  - **User Admin:** No.
  - **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
    - 1400 Series and 1600 Series.
1. M-Series/T-Series: The button is equivalent to **Feature #2**.

---

## Channel Monitor

For Avaya use only. Configurable through web manager only.

---

## Clear Call

This feature can be used to end the last call put on hold. This can be used in scenarios where a first call is already on hold and simply ending the second call will cause an unsupervised transfer of the first call.

### Details

- **Action:** Advanced | Call | Clear Call.
- **Action Data:** None.
- **Default Label:** Clear.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Clear CW

End the user's current call and answer any call waiting. Requires the user to also have call waiting indication on. This function does not work for users with multiple call appearance buttons.

### Details

- **Action:** Advanced | Call | Clear CW.
- **Action Data:** None.
- **Default Label:** ClrCW.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Clear Hunt Group Night Service

Changes the specified hunt group from Night Service mode to 'In Service' mode. This button function is obsolete. The Set Hunt Group Night Service function can be used to toggle a group in/out of service and provides lamp status indication.

Setting and clearing hunt group night service can be done using either manual controls or using a system time profile. The use of both methods to control the night service status of a particular hunt group is not supported.

This function is not supported between systems in a multi-site network. It can only be used by a user currently logged onto the same system as hosting the hunt group.

### Details

- **Action:** Advanced | Call | Clear Hunt Group Night Service.
- **Action Data:** Group number. If left blank, the button will affect all hunt groups of which the user is a member.
  - The **Set Hunt Group Night Service** and **Clear Hunt Group Night Service** short code and button features can be used to switch an SSL VPN service off or on respectively. The service is indicated by setting the service name as the telephone number or action data. Do not use quotation marks.
- **Default Label:** HGNS-.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Clear Hunt Group Out Of Service

Changes the specified hunt groups status from Out of Service mode to 'In Service' mode. This button function is obsolete. The Set Hunt Group Out Of Service function can be used to toggle a group in/out of service and provides lamp status indication.

This function is not supported between systems in a multi-site network. It can only be used by a user currently logged onto the same system as hosting the hunt group.

### Details

- **Action:** Advanced | Call | Clear Hunt Group Out of Service.
- **Action Data:** Group number. If left blank, the button will affect all hunt groups of which the user is a member.
- **Default Label:** HGOS-.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Clear Quota

Quotas can be assigned on outgoing calls to data services such as internet connections. The quota defines the number of minutes available for the service within a time frame set within the service, for example each day, each week or each month.

The Clear Quota function can be used to reset the quota for a specific service or for all services.

### Details

- **Action:** Advanced | Call | Clear Quota.
- **Action Data:** Service name" or "" (all services).
- **Default Label:** Quota.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Coaching Intrusion

This feature allows the you to intrude on another user's call and to talk to them without being heard by the other call parties to which they can still talk. For example: User A is on a call with user B. When user C intrudes on user A, they can hear users A and B but can only be heard by user A.

- Intrusion features are controlled by the **Can Intrude** setting of the user intruding and the **Cannot Be Intruded** setting of user being intruded on. By default, no users can intrude and all users cannot be intruded.
- Intrusion features uses system conference resources during the call. If insufficient conference resource are available, the feature cannot be used.
- Listening to a call without the other parties being aware is subject to local regulations. You must ensure that you have complied with the local regulations. Failure to do so can result in penalties.

The system support a range of other call intrusion methods in addition to this feature.

### Details

- **Action:** Advanced | Call | Coaching Intrusion.
- **Action Data:** User number or name or blank for entry when pressed.
- **Default Label:** Coach or Coaching Intrusion.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No feedback provided..
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - Not supported on non-IP telephones when using a headset.

---

## Conference

This function is intend for use with Avaya M-Series and T-Series phones only. When pressed, the button invokes the same conference process as dialing **Feature 3**.

### Details

- **Action:** Advanced | Call | Conference.
- **Action Data:** None.
- **Default Label:** Conf or Conference Add.
- **Toggles:** No.

- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - M-Series and T-Series.
  - The button is equivalent to **Feature 3**.

---

## Conference Add

Conference add controls can be used to place the user, their current call and any calls they have on hold into a conference. When used to start a new conference, the system automatically assigns a conference ID to the call. This is termed ad-hoc (impromptu) conferencing.

If the call on hold is an existing conference, the user and any current call are added to that conference. This can be used to add additional calls to an ad-hoc conference or to a meet-me conference. Conference add can be used to connect two parties together. After creating the conference, the user can drop from the conference and the two incoming calls remain connected.

For R11.0 and higher, the button has additional features:

- When pressed during a normal two-party call, that call is turned into a two-party conference call. This then provides access to the phone's other conference control, such as to add other parties, without interrupting the call.
- During an existing conference, pressing the button (on 1400, 1600, 9400, 9500, 9600, and J100 Series phones) provides a menu to enter the number of an additional party to add to the conference without put the conference on hold. The other parties in the conference can hear the call progress and if answered the other party is immediately in the conference.

For further details, see [Conferencing](#) on page 690.

### Details

- **Action:** Advanced | Call | Conference Add.
- **Action Data:** None.
- **Default Label:** Conf+ or Conference Add.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.

- M-Series and T-Series.

---

## Conference Meet Me

Conference meet-me refers to features that allow a user or caller to join a specific conference by using the conference's ID number (either preset in the button's configuration or entered at the time of joining the conference).

 **Note:**

- Conference Meet Me features can create conferences that include only one or two parties. These are still conferences that are using resources from the host system's conference capacity.

### Conference ID Numbers

Each conference has a conference ID number:

- **Ad-Hoc Conferences** - By default, ad-hoc conferences are assigned numbers starting from 100 for the first conference in progress. Therefore, for conference Meet-Me features, you should always specify a number away from this range ensure that the conference joined is not an ad-hoc conference started by other users. It is not possible to join a conference using conference Meet-Me features when the conference ID is in use by an ad-hoc conference.
- **User Personal Meet-Me Conferences** - Each user's own extension number is treated as their own personal conference number. Only that user is able to start a conference using that number as the conference ID. Any one else attempting to start a conference with that number will find themselves in a conference but on hold until the owner also joins. Personal conferences are always hosted on the owner's system.
- **System Meet-Me Conferences** - Each of these is assigned a conference ID number when the conference settings are configured.

For further details, see [Conferencing](#) on page 690.

 **Note:**

When a user calls from their mobile twinned number, the personal conference feature will only work if they access the conference using an FNE 18 service.

### Multi-Site Network Conferencing

Meet Me conference IDs are now shared across a multi-site network. For example, if a conference with the ID 500 is started on one system, anyone else joining conference 500 on any system will join the same conference. Each conference still uses the conference resources of the system on which it was started and is limited by the available conference capacity of that system.

Previously separate conferences, each with the same conference ID, could be started on each system in a multi-site network.

### Other Features

- **Transfer to a Conference Button** - A currently connected caller can be transferred into the conference by pressing **TRANSFER**, then the Conference Meet Me button and **TRANSFER** again to complete the transfer. This allows the user to place callers into the conference

specified by the button without being part of the conference call themselves. This option is only support on Avaya phones with a fixed **TRANSFER** button.

- **Conference Button Status Indication** - When the conference is active, any buttons associated with the conference ID indicate the active state.

## Details

- **Action:** Advanced | Call | Conference Meet Me.
- **Action Data:** Conference number. This can be an alphanumeric value up to 15 characters.
  - **User Personal Conference Number** Each user's own extension number is treated as their own personal conference number. Only that user is able to start a conference using that number as the conference ID. Any one else attempting to start a conference with that number will find themselves in a conference but on hold until the owner also joins. Personal conferences are always hosted on the owner's system.
  - When a user calls from their mobile twinned number, the personal conference feature will only work if they access the conference using an FNE18 service.
- **Default Label:** CnfMM <conference number> or Conf. Meet Me <conference number>.
- **Toggles:** No.
- **Status Indication:** Yes

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                 | T-Series,                                                                               |
|--------|------------------------|------------------|--------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| On     | Green on               | Green on         |  Green |  On |
| Off    | Off                    | Off              |  Grey | Off                                                                                     |

For a Conference Meet Me configured to the user's own extension number, the indicator flashes red when the conference is in use but the user has not joined. There is also an abbreviated ring when the indicator changes to flashing red. It changes to solid red when the user joins.

- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - 1100 Series and 1200 Series.

---

## Consult

Supported for CTI emulation only.

### Details

- **Action:** Emulation | Consult.
- **Action Data:** None.
- **Default Label:** Cnslt.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Coverage Appearance

Creates a button that alerts when a call to the specified covered user is unanswered after that users **Individual Coverage Timer** expires. For details, see [Call Coverage Buttons](#) on page 1214.

The call coverage appearance button user must also have at least one call appearance button programmed. The covered user does not need to be using call appearance buttons.

Coverage appearance functions, assigned to buttons that do not have status lamps or icons, are automatically disabled until the user logs in at a phone with suitable buttons.

Appearance buttons can be set with a ring delay if required or to not ring. This does not affect the visual alerting displayed next to the button. The delay uses the user's **Ring Delay (User > Telephony > Multi-line Options)** setting.

### Details

- **Action:** Appearance | Coverage Appearance.
- **Action Data:** User name.
- **Default Label:** <user name>.
- **Toggles:** No.
- **Status Indication:** Yes.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Dial

This action is used to dial the number contained in the Telephone Number field. A partial number can be enter for the user to complete. On buttons with a text label area, **Dial** followed by the number is shown.

### Details

- **Action Data:** Telephone number or partial telephone number.
- **Default Label:** Dial.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - This button action is also supported by the Vantage Connect Expansion application.
    - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
    - 1400 Series and 1600 Series.
    - M-Series and T-Series.

---

## Dial 3K1

The call is presented to local exchange as a "3K1 Speech Call". Useful in some where voice calls cost less than data calls.

### Details

- **Action:** Advanced | Dial | Dial 3K1.
- **Action Data:** Telephone number.
- **Default Label:** D3K1 or Dial 3K1.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Dial 56K

The call presented to local exchange as a "Data Call".

### Details

- **Action:** Advanced | Dial | Dial 56K.
- **Action Data:** Telephone number.
- **Default Label:** D56K or Dial 56K.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Dial 64K

The call is presented to local exchange as a "Data Call".

### Details

- **Action:** Advanced | Dial | Dial 64K.
- **Action Data:** Telephone number.
- **Default Label:** D64K or Dial 64K.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Dial CW

Call the specified extension number and force call waiting indication on if the extension is already on a call. The call waiting indication will not work if the extension called has multiple call appearance buttons in use.

### Details

- **Action:** Advanced | Dial | Dial CW.
- **Action Data:** User number.
- **Default Label:** DCW or Dial Call Waiting.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Dial Direct

Automatic intercom functions allow you to call an extension and have the call automatically answered on speaker phone after 3 beeps. The extension called must support a handsfree speaker. If the extension does not have a handsfree microphone then the user must use the handset if they want to talk. If the extension is not free when called, the call is presented as a normal call on a call appearance button if available.

This feature can be used as part of handsfree announced transfers.

### Details

- **Action:** Advanced | Dial | Dial Direct.
- **Action Data:** User number or name or blank for entry when pressed. If left blank, the **Dial Direct** button can be used with User buttons to specify the target.
- **Default Label:** Dirct or Auto Intercom.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.

- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - This button action is also supported by the Vantage Connect Expansion application.

---

## Dial Emergency

Dials the number specified regardless of any outgoing call barring applicable to the user. See [Configuration for Emergency Calls](#) on page 776.

- Details of calls made using this function can be viewed using an **Emergency View** button. See [Emergency View](#) on page 1146.

### Details

- **Action:** Advanced | Dial | Dial Emergency.
- **Action Data:** Telephone number. This must match the emergency call routing configured for the system or for the extension location.
- **Default Label:** Emrgy or Dial Emergency.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Dial Inclusion

This feature allows you to intrude on another user's call to talk to them. Their current call is put on hold while you talk and automatically reconnected when you end the intrusion. The intruder and the target extension can then talk but cannot be heard by the other party. This can include intruding into a conference call, where the conference will continue without the intrusion target.

During the intrusion all parties hear a repeated intrusion tone. When the intruder hangs-up the original call parties are reconnected. Attempting to hold a dial inclusion call simply ends the intrusion. The inclusion cannot be parked.

- Intrusion features are controlled by the **Can Intrude** setting of the user intruding and the **Cannot Be Intruded** setting of user being intruded on. By default, no users can intrude and all users cannot be intruded.
- Intrusion features uses system conference resources during the call. If insufficient conference resource are available, the feature cannot be used.

The system support a range of other call intrusion methods in addition to this feature.

### Details

- **Action:** Advanced | Dial | Dial Inclusion.
- **Action Data:** User number or name or blank for user selection when pressed. On large display phones, if configured without a preset target, this type of button will display an interactive button menu for target selection.
- **Default Label:** Inclu or Dial Inclusion.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Dial Intercom

Automatic intercom functions allow you to call an extension and have the call automatically answered on speaker phone after 3 beeps. The extension called must support a handsfree speaker. If the extension does not have a handsfree microphone then the user must use the handset if they want to talk. If the extension is not free when called, the call is presented as a normal call on a call appearance button if available.

This feature can be used as part of handsfree announced transfers.

### Details

- **Action:** Emulation | Dial Intercom.
- **Action Data:** User number or name or blank for number entry when pressed. On large display phones, if configured without a preset target, this type of button will display an interactive button menu for target selection.
- **Default Label:** Idial or Auto Intercom.

- **Toggles:** No.
  - **Status Indication:** No.
  - **User Admin:** No.
  - **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
    - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
    - 1400 Series and 1600 Series.
    - M-Series and T-Series.
1. The button is equivalent to **Feature 66 <number>**.

---

## Dial Paging

Makes a paging call to an extension or group specified. If no number is specified, this can be dialed after pressing the button. The target extension or group members must be free and must support handsfree auto-answer in order to hear the page.

On Avaya phones with a **CONFERENCE** button, a paged user can convert the page call into a normal call by pressing that button.

### Details

- **Action:** Advanced | Dial | Dial Paging.
- **Action Data:** User number or name or group number or name or blank for number entry when pressed.
- **Default Label:** Page.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - This button action is also supported by the Vantage Connect Expansion application.
    - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
    - 1400 Series and 1600 Series.
    - M-Series and T-Series.
    - 1100 Series and 1200 Series.

---

## Dial Physical Extn by Number

Call the specified extension using its Base Extension number setting. This is regardless of the current user logged in at that extension and any forwarding, follow me or do not disturb settings applied by the extension user. This function requires the extension to be assigned a default extension number in the system configuration. If the extension does not have a default extension number, Dial Physical Extn by Id should be used.

### Details

- **Action:** Advanced | Dial | Dial Physical Extn by Number.
- **Action Data:** Extension port base extension number.
- **Default Label:** PhyEx or Dial Physical Extn.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Dial Physical Number by ID

Call the specified extension, if free, regardless of the current user logged in at that extension and any forwarding, follow me or do not disturb settings applied by the extension user. This function uses the port ID shown in the system configuration.

### Details

- **Action:** Advanced | Dial | Dial Physical Extn by Id.
- **Action Data:** Extension port ID number.
- **Default Label:** DialP or Dial Extn by Id.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.

- M-Series and T-Series.

---

## Dial Speech

This feature allows a short code to be created to force the outgoing call to use the Speech bearer capability.

### Details

- **Action:** Advanced | Dial | Dial Speech.
- **Action Data:** Telephone number.
- **Default Label:** DSpch or Dial Speech.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Dial V110

The call is presented to local exchange as a "Data Call".

### Details

- **Action:** Advanced | Dial | Dial V110.
- **Action Data:** Telephone number.
- **Default Label:** DV110 or Dial V110.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.

- M-Series and T-Series.

---

## Dial V120

The call is presented to local exchange as a "Data Call".

### Details

- **Action:** Advanced | Dial | Dial V120.
- **Action Data:** Telephone number.
- **Default Label:** DV120 or Dial V120.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Dial Video

The call is presented to the local exchange as a "Video Call".

### Details

- **Action:** Advanced | Dial | Dial Video.
- **Action Data:** Telephone number.
- **Default Label:** Dvide or Dial Video.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Directed Call Pickup

Pickup a call ringing at a specific extension or hunt group.

### Details

- **Action:** Emulation | Directed Pickup.
- **Action Data:** User number or name or group number or name or blank for number entry when pressed. On large display phones, if configured without a preset target, this type of button will display an interactive button menu for target selection.
- **Default Label:** DpkUp or Call Pickup.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
    1. The button is equivalent to **Feature 76**.
  - 1100 Series and 1200 Series.

---

## Directory

A **Dir** button provides access to various directories and allows telephone number selection by dialed name matching. The directories available for searching depend on the phone type, see User Directory Access. Once the user has selected a directory, dialing on the dial pad letter keys is used to filter the display of matching names, with controls for scrolling through the matching names and for calling the currently displayed name.

### Details

- **Action:** Emulation | Directory.
- **Action Data:** None.
- **Default Label:** Dir.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.

- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Display Msg

Allows the sending of text messages to digital phones on the local system.

### Details

- **Action:** Advanced | Dial | Display Msg.
- **Action Data:** The telephone number takes the format N";T" where:
  - **N** is the target extension.
  - **T** is the text message. Note that the ";" before the text and the " after the text are required.
- **Default Label:** Displ.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Do Not Disturb Exception Add

Adds a number to the user's "Do Not Disturb Exception List". This can be the number of an internal user or a number to match the CLI of a particular external caller. Calls from that number, except hunt group calls, will ignore the user's Do Not Disturb setting. For further details see Do Not Disturb (DND).

### Details

- **Action:** Advanced | Do Not Disturb | Do Not Disturb Exception Add.
- **Action Data:** Telephone number or CLI. Up to 31 characters. For CLI numbers any prefix added by the system must also be included.
- **Default Label:** DNDX+.
- **Toggles:** No.

- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - 1100 Series and 1200 Series.

---

## Do Not Disturb Exception Delete

Removes a number from the user's "Do Not Disturb Exception List". This can be the number of an internal user or a number to match the CLI of a particular external caller.

### Details

- **Action:** Advanced | Do Not Disturb | Do Not Disturb Exception Delete.
- **Action Data:** Telephone number or CLI.
- **Default Label:** DNDX-.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - 1100 Series and 1200 Series.

---

## Do Not Disturb Off

Cancels the user's 'do not disturb' mode if set. This button function is obsolete as the do not disturb on function toggles on/off and indicates the button status.

### Details

- **Action:** Advanced | Do Not Disturb | Do Not Disturb Off.
- **Action Data:** None.
- **Default Label:** DNDOf.
- **Toggles:** No.

- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.
  - 1100 Series and 1200 Series.

---

## Do Not Disturb On

Enables the user's 'do not disturb' mode.

### Details

- **Action:** Advanced | Do Not Disturb | Do Not Disturb On.
- **Action Data:** None.
- **Default Label:** DNDOn or Do Not Disturb.
- **Toggles:** Yes.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
    1. The button is equivalent to **Feature 85**.
  - 1100 Series and 1200 Series.
  - This button action is also supported by the Vantage Connect Expansion application.

---

## Drop

This action is supported on phones which do not have a permanent **Drop** button.

- For a currently connected call, pressing **Drop** disconnects the call. When drop is used to end a call, silence is returned to the user rather than dial tone. This is intended operation, reflecting that **Drop** is mainly intended for use by call center headset users.
- If the user has no currently connected call, pressing **Drop** will redirect a ringing call using the user's **Forward on No Answer** setting if set or otherwise to voicemail if available.

- For a conference call, on phones with a suitable display, **Drop** can be used to display the conference parties and allow selection of which party to drop from the conference.

### Details

- **Action:** Emulation | Drop.
- **Action Data:** None.
- **Default Label:** Drop or Drop Call.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** ✓.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.

---

## Emergency View

A button set to this function indicates when a call has been made from the system to which the user's extension is registered. The definition of an emergency call is one using a number routed by a **Dial Emergency** button or short code.

- Pressing the button displays details of currently connected emergency calls (the first 10).
- After pressing the button, the **History** option displays details of any previously connected emergency calls (the first 30) and allows deletion those call details.
- The emergency call history for a system is shared by all users on the same system. Therefore updates to or deleting the history affects the details shown on all user phones on the same system.
- The time shown in the call details, is the UTC time of the alarm calls. On J189 phones, it also includes the location name if an IP Office **Location** entry was used to route the call.
- Note that the button only works for an extension registered to the same system as the outgoing trunk used for the emergency call.

### Details

- **Action:** Emulation | Emergency View.
- **Action Data:** None
- **Default Label:** 911–View or EView
- **Toggles:** No.
- **Status Indication:** Yes
  - The button gives a single ring and then flashes when there is a connected emergency call in progress.

- The button remains on when there are previous emergency calls in the alarm history.
- Note that there is a delay of a few seconds in changes of the lamp state.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Extn Login

**Extn Login** allows a user who has been configured with a **Login Code** (User | Telephony | Supervisor Settings) to take over ownership of any extension. That user's extension number becomes the extension number of the extension while they are logged. This is also called 'hot desking'.

Hot desking is not supported for H175 and J129 telephones.

When used, the user is prompted to enter their extension number and then their log in code. Login codes of up to 15 digits are supported with **Extn Login** buttons. Login codes of up to 31 digits are supported with **Extn Login** short codes.

When a user logs in, as many of their user settings as possible are applied to the extension. The range of settings applied depends on the phone type and on the system configuration.

By default, on 1400, 1600, 9400, 9500, 9600, and J100 Series phones, the user's call log and personal directory are accessible while they are logged in. This also applied to M-Series and T-Series telephones.

On other types of phone, those items such as call logs and speed dials are typically stored locally by the phone and will not change when users log in and log out.

If the user logging in was already logged in or associated with another phone, they will be automatically logged out that phone.

### Details

- **Action:** Advanced | Extension | Extn Login.
- **Action Data:** None.
- **Default Label:** Login.
- **Toggles:** Yes.
- **Status Indication:** Yes.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                | T-Series,                                                                              |
|--------|------------------------|------------------|-------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| On     | Green on               | Green on         |  Green |  On |
| Off    | Off                    | Off              |  Grey  | Off                                                                                    |

- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - 1100 Series and 1200 Series.

---

## Extn Logout

Logs out a user from the phone. The phone will return to its normal default user, if an extension number is set against the physical extension settings in the configuration. Otherwise it takes the setting of the **NoUser** user. This action is obsolete as Extn Login can be used to log out an existing logged in user.

- If the user who logged out was the default user for an extension, dialing \*36 will associate the extension with the user unless they are set to forced log in.
- This feature cannot be used by a user who does not have a log in code.

### Details

- **Action:** Advanced | Extension | Extn Logout.
- **Action Data:** None.
- **Default Label:** Logof or Logout.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - 1100 Series and 1200 Series.
  - This button action is also supported by the Vantage Connect Expansion application.

---

## Flash Hook

Sends a hook flash signal to the currently connected line if that line is an analog line.

### Details

- **Action:** Advanced | Miscellaneous | Flash Hook.
- **Action Data:** Optional. Normally this field is left blank. It can contain the destination number for a Centrex Transfer for external calls on a local analog line from a Centrex service provider. See [Centrex Transfer](#) on page 913.
- **Default Label:** Flash or Flash Hook.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Follow Me Here

Causes calls to the extension number specified, to be redirected to this user's extension. User's with a log in code will be prompted to enter that code when using this function. For further details, see [Follow Me](#) on page 869.

### Details

- **Action:** Advanced | Follow Me | Follow Me Here.
- **Action Data:** User name or user number.
  - If a user name or user number has been entered in the **Action Data** field, when the interactive menu opens, press `Enter` to activate Follow Me Here for the number displayed on the screen.
  - This field can be left blank for number entry when pressed.
  - On large display phones, if configured without a preset target, this type of button will display an interactive button menu for target selection.
- **Default Label:** Here+ or Follow Me Here.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.

- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - 1100 Series and 1200 Series.

---

## Follow Me Here Cancel

Cancels any 'Follow Me Here' set on the specified extension. Only works if entered at the extension to which the extension's calls are being sent by the follow me action. For further details, see [Follow Me](#) on page 869.

### Details

- **Action:** Advanced | Follow Me | Follow Me Here Cancel.
- **Action Data:** User number or blank for number entry when pressed.
  - If a user name or user number has been entered in the **Action Data** field, when the interactive menu opens, press `Enter` to deactivate Follow Me Here for the number displayed on the screen.
  - On large display phones, if configured without a preset target, this type of button will display an interactive button menu for target selection.
- **Default Label:** Here- or Follow Me Here-.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - 1100 Series and 1200 Series.

---

## Follow Me To

Leaving the extension blank prompts the user to enter the extension to which their calls should be redirected. User's with a log in code will be prompted to enter that code when using this function. For further details, see [Follow Me](#) on page 869.

## Details

- **Action:** Advanced | Follow Me | Follow Me To.
- **Action Data:** User name or user number or blank for number entry when pressed.
  - If a user name or user number has been entered in the **Action Data** field, when the interactive menu opens, press `Enter` to activate Follow Me To for the number displayed on the screen.
  - On large display phones, if configured without a preset target, this type of button will display an interactive button menu for target selection.
- **Default Label:** FolTo or Follow Me To.
- **Toggles:** Yes.
- **Status Indication:** Yes. On/off status indication is provided if the button is programmed with a user name or number.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                | T-Series,                                                                              |
|--------|------------------------|------------------|-------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|

  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - 1100 Series and 1200 Series.

---

## Forward Hunt Group Calls Off

Cancels the forwarding of the user's hunt group calls. This function is obsolete since the button function Forward Hunt Group Calls On toggles on/off and indicates status.

## Details

- **Action:** Advanced | Forward | Forward Hunt Group Calls Off.
- **Action Data:** None.
- **Default Label:** FwdH-.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.

- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Forward Hunt Group Calls On

Forward the user's hunt group calls (internal and external). This function only works when forward unconditional is also on and uses the same forwarding number as forward unconditional.

This option is only applied for calls to **Sequential** and **Rotary** type hunt groups. Calls from other hunt group types are not presented to the user when they have Forward Unconditional active. Note also that hunt group calls cannot be forwarded to another hunt group.

### Details

- **Action:** Advanced | Forward | Forward Hunt Group Calls On.
- **Action Data:** None.
- **Default Label:** FwdH+ or Fwd HG Calls.
- **Toggles:** Yes.
- **Status Indication:** Yes.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                  | T-Series,                                                                                |

  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Forward Number

Sets the number to which calls are forwarded when the user has forwarding on. Used for all forwarding options unless a separate **Forward On Busy Number** is also set. Forwarding to an external number is blocked if **Inhibit Off-Switch Transfers** is selected within the system configuration.

## Details

- **Action:** Advanced | Forward | Forward Number.
- **Action Data:** Telephone number.
- The field to be left blank to prompt the user for entry when the button is pressed. If blank, users with a log in code will be prompted to enter that code.
- On large display phones, if configured without a preset target, this type of button will display an interactive button menu for target selection.
- **Default Label:** FwdNo or Fwd Number.
- **Toggles:** No.
- **Status Indication:** Yes. For a button with a prefixed number, status indication will indicate when that number matches the users current set number. For a button with a no number, status indication will show when a number has been set.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                | T-Series,                                                                              |
|--------|------------------------|------------------|-------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| On     | Green on               | Green on         |  Green |  On |
| Off    | Off                    | Off              |  Grey  | Off                                                                                    |

- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - This button action is also supported by the Vantage Connect Expansion application.

---

## Forward On Busy Number

Sets the number to which calls are forwarded when using 'Forward on Busy' and/or 'Forward on No Answer'. Forwarding to an external number is blocked if **Inhibit Off-Switch Transfers** is selected within the system configuration.

For further details, see [Forward on Busy](#) on page 873.

## Details

- **Action:** Advanced | Forward | Forward on Busy Number.
- **Action Data:** Telephone number.
  - The field to be left blank to prompt the user for entry when the button is pressed. If blank, users with a log in code will be prompted to enter that code.
  - On large display phones, if configured without a preset target, this type of button will display an interactive button menu for target selection.

- **Default Label:** FwBNo or Fwd Busy Number.
- **Toggles:** No.
- **Status Indication:** Yes. For a button with a prefixed number, status indication indicates when that number matches the user's current set number. For a button with a no number, status indication shows when a number has been set.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                | T-Series,                                                                              |
|--------|------------------------|------------------|-------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| On     | Green on               | Green on         |  Green |  On |
| Off    | Off                    | Off              |  Grey  | Off                                                                                    |

- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - This button action is also supported by the Vantage Connect Expansion application.

---

## Forward On Busy Off

Switches forward on busy off. This button function is obsolete, as Forward On Busy On can be used to switch forward on busy on/off and provides status indication.

### Details

- **Action:** Advanced | Forward | Forward on Busy Off.
- **Action Data:** None.
- **Default Label:** FwBOf.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Forward On Busy On

Enables forwarding when the user's extension is busy. For users with call appearance buttons, they will only return busy when all call appearance buttons are in use. Uses the **Forward Number**

as its destination unless a separate **Forward on Busy Number** is set. For further details, see [Forward on Busy](#) on page 873.

### Details

- **Forward Internal (User | Forwarding)** can also be used to control whether internal calls are forwarded.
- **Action:** Advanced | Forward | Forward on Busy On.
- **Action Data:** None.
- **Default Label:** FwBOn or Fwd Busy.
- **Toggles:** Yes.
- **Status Indication:** Yes.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                | T-Series,                                                                              |
|--------|------------------------|------------------|-------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| On     | Green on               | Green on         |  Green |  On |
| Off    | Off                    | Off              |  Grey  | Off                                                                                    |

- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - This button action is also supported by the Vantage Connect Expansion application.

---

## Forward On No Answer Off

Switches forward on no answer off. This button function is obsolete, as Forward On No Answer On can be used to switch forward on no answer on/off and provides status indication.

### Details

- **Action:** Advanced | Forward | Forward on No Answer Off.
- **Action Data:** None.
- **Default Label:** FwNOF.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.

- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

## Forward On No Answer On

Switches forward on no answer on/off. The time used to determine the call as unanswered is the user's no answer time. Uses the **Forward Number** as its destination unless a separate **Forward on Busy Number** is set.

For further details, see [Forward on No Answer](#) on page 875.

### Details

- **Forward Internal (User | Forwarding)** can also be used to control whether internal calls are forwarded.
- **Action:** Advanced | Forward | Forward on No Answer On.
- **Action Data:** None.
- **Default Label:** FwNOn or Fwd No Answer.
- **Toggles:** Yes.
- **Status Indication:** Yes.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                  | T-Series,                                                                                |
|--------|------------------------|------------------|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| On     | Green on               | Green on         |  Green |  On |
| Off    | Off                    | Off              |  Grey  | Off                                                                                      |

- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - This button action is also supported by the Vantage Connect Expansion application.

## Forward Unconditional Off

Switch 'forward all calls' off. This does not affect 'Forward on No Answer' and/or 'Forward on Busy' if also on. This function is obsolete as a button set to Forward Unconditional On toggles on/off and indicates when on.

## Details

- **Action:** Advanced | Forward | Forward Unconditional Off.
- **Action Data:** None.
- **Default Label:** FwUOf.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Forward Unconditional On

This function is also known as 'divert all' and 'forward all'. It forwards all calls, except hunt group and page calls, to the forward number set for the user's extension. To also forward hunt group calls to the same number 'Forward Hunt Group Calls On' must also be used.

For further details, see [Forward Unconditional](#) on page 871.

## Details

- **Forward Internal (User | Forwarding)** can also be used to control whether internal calls are forwarded.
  - In addition to the lamp indication shown below, some phones display **D** when forward unconditional is on.
- **Action:** Advanced | Forward | Forward Unconditional On.
- **Action Data:** None.
- **Default Label:** FwUOn or Fwd Unconditional.
- **Toggles:** Yes.
- **Status Indication:** Yes.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                  | T-Series,                                                                                |
|--------|------------------------|------------------|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| On     | Green on               | Green on         |  Green |  On |
| Off    | Off                    | Off              |  Grey  | Off                                                                                      |

- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.

- 1400 Series and 1600 Series.
- M-Series and T-Series.
  1. The button is equivalent to **Feature 4 <number>**.
- This button action is also supported by the Vantage Connect Expansion application.

## Group

Monitors the status of a hunt group queue. This option is only supported for hunt groups with queuing enabled. The user does not have to be a member of the group.

Depending on the users button type, indication is given for when the group has alerting calls and queued calls (queued in this case is defined as more calls waiting than there are available group members).

Pressing a **Group** button answers the longest waiting call.

The definition of queued calls include group calls that are ringing. However, for operation of the **Group** button, ringing calls are separate from other queued calls.

### Details

- **Action:** Group.
- **Action Data:** Group name enclosed in " " double-quotes or group number.
- **Default Label:** <group name>.
- **Toggles:** No.
- **Status Indication:** Required.

| Status          | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                         | T-Series, M-Series |
|-----------------|------------------------|------------------|----------------------------------------------------------------------------------------------------|--------------------|
| - No calls      | Off                    | Off              |  Grey         | Off                |
| - Call alerting | Green flash            | Green flash      |  Blue         | ▲ Slow flash       |
| - Calls queued  | Red flash              | Red flash        |  <b>Green</b> | ▲ Slow flash       |

- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

## Group Listen On

Using group listen allows callers to be heard through the phone's handsfree speaker but to only hear the phone's handset microphone. When group listen is enabled, it modifies the handsfree functionality of the user's phone in the following manner

- When the user's phone is placed in handsfree/speaker mode, the speech path from the connected party is broadcast on the phone speaker but the phone's base microphone is disabled.
- The connected party can only hear speech delivered through the phone's handset microphone.
- Group listen is not supported for IP phones or when using a phone's **HEADSET** button.
- For T-Series and M- Series phones, this option can be turned on or off during a call. For other phones, currently connected calls are not affected by changes to this setting, instead group listen must be selected before the call is connected.

Group listen is automatically turned off when the call is ended.

### Details

- **Action:** Advanced | Extension | Group Listen On.
- **Action Data:** None.
- **Default Label:** Group Listen On.
- **Toggles:** Yes.
- **Status Indication:** Yes.

| Status | 1400, 9400, 9500 | T-Series, |
|--------|------------------|-----------|
| On.    | Green on         | ▲ On      |
| Off.   | Off              | Off       |

- **User Admin:** No.
  - **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
    - 1400 Series, 9400 Series, 9500 Series.
    - M-Series and T-Series.
1. The button is equivalent to **Feature 802** (On) and **Feature #802** (Off).

## Group Paging

Makes a paging call to an extension or group specified. If no number is specified, this can be dialed after pressing the button. The target extension or group members must be free and must support handsfree auto-answer in order to hear the page.

On Avaya phones, a paged user can convert the page call into a normal call by pressing the **Conference** button.

### Details

- **Action:** Emulation | Group Paging.
- **Action Data:** User number or name or group number or name. On large display phones, if configured without a preset target, this type of button will display an interactive button menu for target selection.
- **Default Label:** GrpPg.
- **Toggles:** No.
- **Status Indication:** Yes.
- **User Admin:** Yes.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
    1. The button is equivalent to **Feature 60 <number>**.
  - 1100 Series and 1200 Series.

---

## Headset Toggle

This function is intended for use with Avaya phones that have separate handset and headset sockets but do not provide a dedicated Headset button. On phones without a headset socket or with a dedicated headset button this control will have no effect.

### Details

- **Action:** Miscellaneous | Headset Toggle.
- **Action Data:** None.
- **Default Label:** HdSet.
- **Toggles:** Yes.
- **Status Indication:** Yes.
- **User Admin:** No.

---

## Hold Call

This uses the Q.931 Hold facility, and "holds" the incoming call at the ISDN exchange, freeing up the ISDN B channel. The Hold Call feature "holds" the current call to a slot. The current call is

always automatically placed into slot 0 if it has not been placed in a specified slot. Only available if supported by the ISDN exchange.

### Details

- **Action:** Advanced | Hold | Hold Call.
- **Action Data:** ISDN Exchange hold slot number or blank (slot 0).
- **Default Label:** Hold.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Hold CW

Place the user's current call on hold and answers the waiting call. This function is not supported on phones which have multiple call appearance buttons set.

### Details

- **Action:** Advanced | Hold | Hold CW.
- **Action Data:** None.
- **Default Label:** HoldCW.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Hold Music

This feature allows the user to listen to the system's music on hold. See Music On Hold for more information.

### Details

- **Action:** Advanced | Hold | Hold Music.

- **Action Data:** Optional. Systems can support multiple hold music sources. However only the system source is supported for **Hold Music** buttons.
- **Default Label:** Music or Hold Music.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

## Hunt Group Enable

An individual users membership of any particular hunt groups is programmed through the system configuration. This control allows the user to enable or disable that membership. While enabled, the user can receive hunt group calls when logged in.

### Details

- In addition to the lamp indication below, phones display **G** when any group membership is enabled.
- **Action:** Advanced | Hunt Group | Hunt Group Enable.
- **Action Data:** Group number or name or blank for all groups of which the user is a member.
- **Default Label:** HGE na or HG Enable.
- **Toggles:** Yes.
- **Status Indication:** Required.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                  | T-Series,                                                                                |
|--------|------------------------|------------------|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| On     | Green on               | Green on         |  Green |  On |
| Off    | Off                    | Off              |  Grey  | Off                                                                                      |

- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

- This button action is also supported by the Vantage Connect Expansion application.

---

## Hunt Group Disable

This function is obsolete, the Hunt Group Enable function being able to toggle membership between enabled and disabled and providing lamp indication of when membership is enabled.

An individual user's membership of any particular hunt groups is programmed through the system configuration. This control allows the user to disable that membership. They will no longer receive calls to that hunt group until their membership is enabled again.

### Details

- **Action:** Advanced | Hunt Group | Hunt Group Disable.
- **Action Data:** Group number or blank for all groups of which the user is a member.
- **Default Label:** HGDis.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Inspect

Supported for CTI emulation only.

Allows users on display phones to determine the identification of held calls. Allows users on an active call to display the identification of incoming calls.

### Details

- **Action:** Emulation | Inspect.
- **Action Data:** None.
- **Default Label:** Inspt.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.

- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

## Internal Auto-Answer

This function is also known as handsfree auto-answer. It sets the user's extension to automatically connect internal calls after a single tone. This function should only be used on phones that support handsfree operation.

### Details

- **Action:** Emulation | Internal Auto-Answer.
- **Action Data:** Optional.
  - If left blank this function acts as described above for internal auto-answer.
  - **FF** can be entered. In that case the button will enable/disable headset force feed operation for external calls. In this mode, when headset mode is selected but the phone is idle, an incoming external call will cause a single tone and then be automatically connected. This operation is only supported on Avaya phones with a fixed **HEADSET** button. Ring delay is applied if set on the appearance button receiving the call before the call is auto-connected.
- **Default Label:** HFAns or Auto Answer.
- **Toggles:** Yes.
- **Status Indication:** Required.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                  | T-Series,                                                                                |
|--------|------------------------|------------------|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| On     | Green on               | Green on         |  Green |  On |
| Off    | Off                    | Off              |  Grey  | Off                                                                                      |

- **User Admin:** Yes.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

## Last Number Redial

This function is intend for use with Avaya M-Series and T-Series phones only. When pressed, the button invokes the same last number redial process as dialing **Feature 5**.

### Details

- **Action:** Advanced | Call | Last Number Redial.
- **Action Data:** None.
- **Default Label:** Again.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - M-Series and T-Series.
    - The button is equivalent to **Feature 5**.

---

## Leave Word Calling

Supported for CTI emulation only.

Leaves a message for the user associated with the last number dialed to call the originator.

### Details

- **Action:** Emulation | Leave Word Calling.
- **Action Data:** None.
- **Default Label:** LWC.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Line Appearance

Creates an line appearance button linked to the activity of a specified line appearance ID number. The button can then be used to answer and make calls on that line. For details, see [Line Appearance Buttons](#) on page 1219.

The line appearance button user must also have at least one call appearance button programmed before line appearance buttons can be programmed.

Line appearance functions, assigned to buttons that do not have status lamps or icons, are automatically disabled until the user logs in at a phone with suitable buttons.

### Details

- **Action:** Appearance | Line Appearance.
- **Action Data:** Line ID number.
- **Default Label:** Line <Line ID number>.
- **Toggles:** No.
- **Status Indication:** Yes.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
    1. Not supported on T7000, T7100, M7100 and M7100N phones.

---

## MADN Call Appearance

Multiple Appearance Directory Number (MADN) emulates an Avaya Communication Server 1000 key and lamp style feature.

When using normal appearance buttons to answer or make calls, the information (name and number) presented to the other end of the call is that of the button user (subject to any other line and short code settings). When using a MADN call appearance button, the information presented is that of the user to which the button is associated rather than that of the button user.

The user associated with a MADN button does not need to have a license or an active extension. However, they must have an extension number. The system considers the user's records when the user makes a call using the MADN buttons. You can have up to 30 MADN buttons associated with the same user.

MADN can operate in two modes:

- **MADN Single Call Appearance (SCA)**

The button is configured with the user name of the associated user and one of their call appearances. This provides the following behaviors:

- Incoming extension calls: The button acts like a Bridged Appearance button to the associated user.
- Incoming group calls: The button alerts if associated user is a member of the hunt group and alerting.

- Outgoing calls: The button acts like a Call Appearance. It presents the call as originating from the button user but with the number and name of the associated user in the calling party information.

- **MADN Multiple Call Appearance (MCA)**

The button is configured with just the user name of the associated user. This provides the following behaviors:

- Incoming extension calls: The button acts like a Coverage Appearance to the associated user.
- Incoming groups calls: The button does not alert.
- Outgoing calls: The button acts like a Call Appearance. It presents the call as originating from the button user but with the number of the associated user in the calling party information.

## Details

- **Action** Either:
  - Appearance | MADN Single Call Appearance
  - Appearance | MADN Multiple Call Appearance
- **Action Data:**
  - MADN Single Call Appearance: User Name, Call Appearance button number and Ring Delay.
  - MADN Multiple Call Appearance: User Name and Ring Delay.
- **Default Label:**
  - MADN SCA: <MADN number S=>
  - MADN MCA: <MADN number M=>
- **Toggles:** No.
- **Status Indication:**
  - MADN SCA: Yes. See Bridge Appearance Button Indication.
  - MADN MCA: Yes. See Coverage Button Indication.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.

---

## Manual Exclude

Supported for CTI emulation only.

### Details

- **Action:** Emulation | Manual Exclude
- **Action Data:** None.
- **Default Label:** Excl.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## MCID Activate

This action is used with ISDN Malicious Caller ID call tracing. It is used to trigger a call trace at the ISDN exchange. The call trace information is then provided to the appropriate legal authorities.

This option requires the line to the ISDN to have MCID enabled at both the ISDN exchange and on the system. The user must also be configured with **Can Trace Calls (User | Telephony | Supervisor Settings)** enabled.

Currently, in Server Edition network, MCID is only supported for users using an MCID button and registered on the same IP500 V2 Expansion system as the MCID trunks.

### Details

- **Action:** Advanced | Miscellaneous | MCID Activate.
- **Action Data:** None.
- **Default Label:** MCID or Malicious Call.
- **Toggles:** No.
- **Status Indication:** Yes.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

## Monitor Analog Trunk MWI

Enables a user to receive message waiting indicator (MWI) signals from analog trunks terminating on the ATM4U-V2 card. MWI is a telephone feature that turns on a visual indicator on a telephone when there are recorded messages.

### Details

- **Action:** Advanced | Voicemail | Monitor Analog Trunk MWI.
- **Action Data:** The line appearance ID of the analog line for which MWI will be received.
- **Default Label:** Trunk MWI.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.

## Off Hook Station

Enables the user's extension to be controlled by an application, for example SoftConsole. Calls can then be answered and cleared through the application without having to manually go off or on hook. Requires the phone to support full handsfree operation.

### Details

- **Action:** Advanced | Miscellaneous | Off Hook Station.
- **Action Data:** None.
- **Default Label:** OHStn.
- **Toggles:** Yes.
- **Status Indication:** Yes.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                  | T-Series,                                                                                |
|--------|------------------------|------------------|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| On     | Green on               | Green on         |  Green |  On |
| Off    | Off                    | Off              |  Grey  | Off                                                                                      |

- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Pause Recording

This feature can be used to pause any call recording. It can be used during a call that is being recorded to omit sensitive information such as customer credit card information. This feature can be used with calls that are recorded both manually or calls that are recorded automatically.

The button status indicates when call recording has been paused. The button can be used to restart call recording. The system **Auto Restart Paused Recording** (System | Voicemail) setting can be used to set a delay after which recording is automatically resumed.

If the voicemail system is configured to provide advice of call recording warnings, then pausing the recording will trigger a "Recording paused" prompt and a repeat of the advice of call recording warning when recording is resumed.

### Details

- **Action:** Advanced | Call | Pause Recording.
- **Action Data:** None.
- **Default Label:** PauseRec or Pause Recording.
- **Toggles:** Yes.
- **Status Indication:** Yes.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.

---

## Priority Call

This feature allows the user to call another user even if they are set to 'do not disturb'. A priority call will follow forward and follow me settings but will not go to voicemail.

### Details

- **Action:** Advanced | Call | Priority Call.
- **Action Data:** User number or name.
- **Default Label:** PCall or Priority Call.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.

- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - This button action is also supported by the Vantage Connect Expansion application.

---

## Priority Calling

Supported for CTI emulation only.

### Details

- **Action:** Emulation | Priority Calling.
- **Action Data:** None.
- **Default Label:** Pcall.
- **Toggles:** No.
- **Status Indication:** No.
- **Phone Support:** The following table indicates phones which support the programmable button:
  - 1400 Series and 1600 Series.

---

## Private Call

When on, any subsequent calls cannot be intruded on until the user's private call status is switched off. The exception is Whisper Page which can be used to talk to a user on a private call.

Note that use of private calls is separate from the user's intrusion settings. If the user's **Cannot be Intruded** (User | Telephony | Supervisor Settings) setting is enabled, switching private calls off does not affect that status. To allow private calls to be used to fully control the user status, **Cannot be Intruded** (User | Telephony | Supervisor Settings) should be disabled for the user.

If enabled during a call, any current recording, intrusion or monitoring is ended.

### Details

- **Action:** Advanced | Call | Private Call.
- **Action Data:** None.
- **Default Label:** PrivC or Private Call.
- **Toggles:** Yes.

- **Status Indication:** Yes.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                | T-Series,                                                                              |
|--------|------------------------|------------------|-------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| On     | Green on               | Green on         |  Green |  On |

- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - 1100 Series and 1200 Series.

---

## Relay Off

Opens the specified switch in the system's external output port (**EXT O/P**).

This feature is not supported on Linux based systems. For Server Edition, this option is only supported on Expansion System (V2) units.

### Details

- **Action:** Advanced | Relay | Relay Off.
- **Action Data:** Switch number (1 or 2).
- **Default Label:** Rely-.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Relay On

Closes the specified switch in the system's external output port (**EXT O/P**).

This feature is not supported on Linux based systems. For Server Edition, this option is only supported on Expansion System (V2) units.

## Details

- **Action:** Advanced | Relay | Relay On.
- **Action Data:** Switch number (1 or 2).
- **Default Label:** Rely+ or Relay On.
- **Toggles:** Yes.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - 1100 Series and 1200 Series.

---

## Relay Pulse

Closes the specified switch in the system's external output port (**EXT O/P**) for 5 seconds and then opens the switch.

This feature is not supported on Linux based systems. For Server Edition, this option is only supported on Expansion System (V2) units.

## Details

- **Action:** Advanced | Relay | Relay Pulse.
- **Action Data:** Switch number (1 or 2).
- **Default Label:** Relay or Relay Pulse.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - 1100 Series and 1200 Series.

---

## Resume Call

Resume a call previously suspended to the specified ISDN exchange slot. The suspended call may be resumed from another phone/ISDN Control Unit on the same line.

### Details

- **Action:** Advanced | Call | Resume Call.
- **Action Data:** ISDN Exchange suspend slot number.
- **Default Label:** Resum.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Request Coaching Intrusion

This feature allows a user to request that another user intrude on a call and talk to them without being heard by the other call parties to which they can still talk.

- Intrusion features are controlled by the **Can Intrude** setting of the user intruding and the **Cannot Be Intruded** setting of user being intruded on. By default, no users can intrude and all users cannot be intruded.
- Intrusion features uses system conference resources during the call. If insufficient conference resource are available, the feature cannot be used.

### Warning:

- Listening to a call without the other parties being aware is subject to local regulations. You must ensure that you have complied with the local regulations. Failure to do so can result in penalties.
- 

The system support a range of other call intrusion methods in addition to this feature. The Request Coaching Intrusion feature exhibits the following behavior:

- A coaching request can be sent to a user or a group.
- While the request is pending, the user can cancel the request by pressing the **Request Coach** button again.
- Once a coaching session is established, the user that initiated the request can include the coach in the call, transfer the call to the coach, or drop the coach from the call.
- Once a coaching session is established, the coach can join the call or steal the call. The coach cannot transfer or conference the call.

- Once the primary call ends, the coaching call continues.

## Details

### Details

- **Action:** Advanced | Call | Request Coaching Intrusion.
- **Action Data:** None.
- **Default Label:** Request Coach or Request Coaching Intrusion.
- **Toggles:** Yes.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.

---

## Retrieve Call

Retrieves a call previously held to a specific ISDN exchange slot. Only available when supported by the ISDN exchange.

### Details

- **Action:** Advanced | Call | Retrieve Call.
- **Action Data:** Exchange hold slot number.
- **Default Label:** Retrив.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - 1100 Series and 1200 Series.

---

## Ring Back When Free

Sets a ringback on the extension being called. When the target extension ends its current call, the ringback users is rung (for their set No Answer Time) and if they answer, a new call is made to the target extension.

Ringback can be cleared using the Cancel Ring Back When Free function.

### Details

- **Action:** Advanced | Miscellaneous | Ring Back When Free.
- **Action Data:** None.
- **Default Label:** AutCB or Auto Callback.
- **Toggles:** No.
- **Status Indication:** Yes.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                | T-Series,                                                                              |

  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Self-Administer

Allows a user to program features against other programmable buttons themselves.

Appearance can no longer be used to create call appearance buttons. Similarly, existing call appearance button cannot be overwritten using any of the other Admin button functions.

User's with a log in code will be prompted to enter that code when they use this button action.

On 4412D+, 4424D+, 6408D, 6416D, 6424D phones:

- **Admin** can be permanently accessed via **Menu**    **Admin**. See Using a Menu Key.
- **Admin1** can be permanently accessed via **Menu**    **ProgA**,   **DSS**.

### Details

- **Action:** Emulation | Self-Administer.
- **Action Data:** See below.

| Value       | T-Series and M-Series phones                                                                    | Other Phones                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------|-------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>None</b> | The <b>Feature *3</b> process is started with an alternate set of possible functions.           | If no value is set, the button allows user programming of the following emulation actions:<br>- <b>Abbreviated Dial, Abbreviated Dial Program, Account Code Entry, AD Suppress, Automatic Callback, Break Out, Call Forwarding All, Call Park, Call Park and Page, Call Park To Other Extension, Call Pickup, Call Pickup Any, Conference Meet Me, Dial Paging, Directed Call Pickup, Directory, Drop, Group Paging, Headset Toggle, Hook Flash, Internal Auto-Answer, Ringer Off, Self-Administer, Send All Calls, Set Absent Text, Set Hunt Group Night Service, Time of Day, Timer, Twinning.</b> |
| <b>1</b>    | The <b>Feature *1</b> process is started for assigning <b>Abbreviated Dial</b> button.          | If <b>1</b> is entered as the telephone number, allows user programming of the following system functions.<br>- <b>Abbreviated Dial, Group, CPark, User, Flash Hook.</b>                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>2</b>    | The <b>Feature *6</b> process is started for setting the ring type.                             | If <b>2</b> is entered, the button can be used for viewing details of the control unit type and its software version. This option is available. If the user has a log in code set, they will be prompted to enter that code. System phone users (see <a href="#">System Phone Features</a> on page 850) can also use the button to manually set the system's date and time.                                                                                                                                                                                                                          |
| <b>3</b>    | The option <b>3</b> is used with M-Series and T-Series sets to enable display contrast control. | Not used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

- **Default Label:** Admin or Self Administer.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** Yes.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

## Send All Calls

Sets the user's extension into 'Do Not Disturb' mode. Callers, other than those on the user's do not disturb exception list, receive busy or are diverted to the user's voicemail mailbox. Note that with a call already connected and other calls already alerting, enabling Do Not Disturb will not affect those calls already existing. For full details of see Do Not Disturb.

When on, most phones display an **N** on the display. This function and the Do Not Disturb On function work in parallel, ie. setting one sets the other.

### Details

- **Action:** Emulation | Send All Call.
- **Action Data:** None.
- **Default Label:** SAC or Send All Calls.
- **Toggles:** Yes.
- **Status Indication:** Yes.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                | T-Series,                                                                              |
|--------|------------------------|------------------|-------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|

- **User Admin:** Yes.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

## Set Absent Text

This feature can be used to select the user's current absence text. This text is then displayed to internal callers who have suitable display phones or applications. It doesn't change the user's status. The absence text message is limited to 128 characters. Note however that the amount displayed will depend on the caller's device or application.

The text is displayed to callers even if the user has forwarded their calls or is using follow me. Absence text is supported across a multi-site network.

The user still has to select **Set** or **Clear** on their phone to display or hide the text.

### Details

- **Action:** Advanced | Set | Set Absent Text.

- **Action Data:** Optional. On certain phones, if the button is set without any Action Data, the user is prompted to select their absence text and switch it on/off through a menu shown on the phone display.

The telephone number should take the format "**y,n,text**" where:

- **y** = 0 or 1 to turn this feature off or on respectively.
- **n** = the number of the absent statement to use:

|                        |                          |                     |
|------------------------|--------------------------|---------------------|
| 0 = None.              | 4 = Meeting until.       | 8 = With cust. til. |
| 1 = On vacation until. | 5 = Please call.         | 9 = Back soon.      |
| 2 = Will be back.      | 6 = Don't disturb until. | 10 = Back tomorrow. |
| 3 = At lunch until.    | 7 = With visitors until. | 11 = Custom.        |

**text** = any text to follow the absent statement..

- **Default Label:** Absnt or Absence Text.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Set Account Code

Dials an account code and then returns dial tone for the user to dial a number. Can also be used to enter an account code after a call has been connected.

### Details

- **Action:** Advanced | Set | Set Account Code..
- **Action Data:** Account code or blank. If blank, the user is prompted to dial an account code after pressing the button. This option is not supported on XX02 phone modules.
- **Default Label:** Acct or Account Code.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.

- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Set Hunt Group Night Service

Puts the specified hunt group into Night Service mode. Calls to a group set to night service, receive busy or are diverted to voicemail if available or are diverted to the group's night service fallback group if set.

Setting and clearing hunt group night service can be done using either manual controls or using a system time profile. The use of both methods to control the night service status of a particular hunt group is not supported.

This function is not supported between systems in a multi-site network. It can only be used by a user currently logged onto the same system as hosting the hunt group.

### Details

- **Action:** Advanced | Set | Set Hunt Group Night Service.
- **Action Data:** Hunt group extension number.
  - If left blank, the button will affect all hunt groups of which the user is a member.
  - The **Set Hunt Group Night Service** and **Clear Hunt Group Night Service** short code and button features can be used to switch an SSL VPN service off or on respectively. The service is indicated by setting the service name as the telephone number or action data. Do not use quotation marks.
- **Default Label:** HGNS+ or HG Night Service.
- **Toggles:** Yes.
- **Status Indication:** Required. If the button is blank (no specific hunt group) it will indicate on if any one of the hunt groups of which the user is a member is set to night service. If the button is set for multiple hunt groups it will indicate on if any one of those groups is set to night service.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                  | T-Series,                                                                                |
|--------|------------------------|------------------|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| On     | Green on               | Green on         |  Green |  On |
| Off    | Off                    | Off              |  Grey  | Off                                                                                      |

- **User Admin:** No.

- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

## Set Hunt Group Out Of Service

Puts the specified hunt group into Out of Service mode. Calls to a group set to out of service receive busy or are diverted to voicemail if available or are diverted to the group's out of service fallback group if set.

This function can be used to override hunt groups already set to night service mode by an associated time profile.

### Details

- **Action:** Advanced | Set | Set Hunt Group Out of Service.
- **Action Data:** Hunt group extension number. If left blank, the button will affect all hunt groups of which the user is a member.
- **Default Label:** HGOS+ or HG Out of Service.
- **Toggles:** Yes.
- **Status Indication:** Required. If the button is blank (no specific hunt group) it will indicate on if any one of the hunt groups of which the user is a member is set out of service. If the button is set for multiple hunt groups it will indicate on if any one of those groups is set out of service.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                  | T-Series,                                                                                |
|--------|------------------------|------------------|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| On     | Green on               | Green on         |  Green |  On |
| Off    | Off                    | Off              |  Grey  | Off                                                                                      |

- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

## Set Inside Call Seq

This feature allows the user to select the ringing used on their analog extension for internal calls.

### Details

- **Action:** Advanced | Set | Set Inside Call Seq.
- **Action Data:** 0 to 10.
  - The number sets to the required ring pattern. See [Ring Tones](#) on page 779.
  - The numbering starts at 0 for Default Ring, 1 for Ring Normal, 2 for RingType1, and so on.
- **Default Label:** ICSeq.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.

---

## Set Night Service Destination

This button allows the user to change the Night Service target of a hunt group. The button user does not have to be a member of the hunt group. In a multi-site network this function can be used for hunt groups on remote systems.

Changing the destination does not affect calls already ringing at the hunt groups previous night service destination.

### Details

- **Action:** Advanced | Set | Set Night Service Group.
- **Action Data:** Hunt group extension number. This is the group for which the night service destination is being set.
- **Default Label:** SetNSG or HG NS Group.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Set No Answer Time

Allows the user to change their no answer time setting. This is the time calls ring before going to voicemail or following the user's divert on no answer setting if set on.

In situations where call coverage is also being used, the user's no answer time must be greater than their individual coverage time for coverage to occur.

### Details

- **Action:** Advanced | Set | Set No Answer Time.
- **Action Data:** Time in seconds.
- **Default Label:** NATim or No Answer Time.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Set Out of Service Destination

This button allows the user to change the Out of Service target of a hunt group. The button user does not have to be a member of the hunt group. In a multi-site network this function can be used for hunt groups on remote systems.

Changing the destination does not affect calls already ringing at the hunt groups previous Out of Service destination.

### Details

- **Action:** Advanced | Set | Set Out of Service Group.
- **Action Data:** Hunt group extension number. This is the group for which the night service destination is being set.
- **Default Label:** SetOOSG or HG OS Group.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Set Outside Call Seq

This feature allows the user to select the ringing used on their analog extension for external calls.

### Details

- **Action:** Advanced | Set | Set Outside Call Seq.
- **Action Data:** 0 to 10.
  - The number sets to the required ring pattern. See [Ring Tones](#) on page 779.
  - The numbering starts at 0 for Default Ring, 1 for Ring Normal, 2 for RingType1, and so on.
- **Default Label:** OCSeq.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.

---

## Set Ringback Seq

This feature allows the user to select the ringing used on their analog extension for ringback calls.

### Details

- **Action:** Advanced | Set | Set Ringback Seq.
- **Action Data:** 0 to 10.
  - The number sets to the required ring pattern. See [Ring Tones](#) on page 779.
  - The numbering starts at 0 for Default Ring, 1 for Ring Normal, 2 for RingType1, and so on.
- **Default Label:** RBSeq.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.

---

## Set Wrap Up Time

Allows users to change their Wrap-up Time (User | Telephony | Call Settings) setting. Other phones or applications monitoring the user's status will indicate the user as still being busy (on a call). Hunt group calls will not be presented to the user.

If the user is using a single line set, direct calls also receive busy treatment. If the user is using a mutli-line set (multiple call appearances), direct calls to them will ring as normal.

It is recommended that this option is not set to less than the default of 2 seconds. 0 is used to allow immediate ringing.

### Details

- **Action:** Advanced | Set | Set Wrap Up Time.
- **Action Data:** Time in seconds. Range 0 to 99999 seconds.
- **Default Label:** WUTim or Wrap-up Time.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Speed Dial

When pressed, the button invokes the same process as dialing **Feature 0**.

- If **Feature 0** is followed by a 3-digit index number in the range 000 to 999, the system directory entry with the matching index number is dialed.
- If **Feature 0** is followed by \* and a 2-digit index number in the range 00 to 99, the personal directory entry with the matching index number is dialed. Note: Release 10.0 allows users to have up to 250 personal directory entries. However, only 100 of those can be assigned index numbers.

### Details

- **Action:** Advanced | Dial | Speed Dial.
- **Action Data:** None.
- **Default Label:** SpdDial.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support**
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - M-Series and T-Series.

- 1100 Series and 1200 Series.

---

## Stamp Log

The stamp log function is used to insert a line into any System Monitor trace that is running. The line in the trace indicates the date, time, user name and extension plus additional information. The line is prefixed with **LSTMP: Log Stamped** and a log stamp number. When invoked from a Avaya phone with a display, **Log Stamped#** is also briefly displayed on the phone. This allows users to indicate when they have experienced a particular problem that the system maintainer want them to report and allows the maintainer to more easily locate the relevant section in the monitor trace.

The log stamp number is set to 000 when the system is restarted. The number is then incremented after each time the function is used in a cycle between 000 and 999. Alternately if required, a specific stamp number can be assigned to the button or short code being used for the feature.

### Details

- **Action:** Advanced | Miscellaneous | Stamp Log.
- **Action Data:** Optional. Blank or any 3 digit number.
- **Default Label:** Stamp Log.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
    1. Not supported on T7000, T7100, M7100 and M7100N telephones.
  - 1100 Series and 1200 Series.

---

## Stored Number View

Supported for CTI emulation only.

Allows a user to view the contents of any programmed feature button.

### Details

- **Action:** Emulation | Stored Number View.

- **Action Data:** None.
- **Default Label:** BtnVu.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Suspend Call

Uses the Q.931 Suspend facility. Suspends the incoming call at the ISDN exchange, freeing up the ISDN B channel. The call is placed in exchange slot 0 if a slot number is not specified. Only available when supported by the ISDN exchange.

### Details

- **Action:** Advanced | Suspend | Suspend.
- **Action Data:** Exchange slot number or blank (slot 0).
- **Default Label:** Suspe.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.

  - 1400 Series and 1600 Series.

---

## Suspend CW

Uses the Q.931 Suspend facility. Suspends the incoming call at the ISDN exchange and answer the call waiting. The call is placed in exchange slot 0 if a slot number is not specified. Only available when supported by the ISDN exchange.

### Details

- **Action:** Advanced | Suspend | Suspend CW.
- **Action Data:** Exchange slot number or blank (slot 0).
- **Default Label:** SusCW.

- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Swap CLID Name/Number

Allows the user to toggle between Caller Name and Caller ID.

### Details

- **Action:** Emulation | Swap CLID Name/Number
- **Action Data:** None.
- **Default Label:**
- **Toggles:** Yes.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - M-Series and T-Series.

---

## Time of Day

Displays the time and date on the user's telephone. This function is ignored on those Avaya phones that display the date/time by default.

### Details

- **Action:** Emulation | Time of Day.
- **Action Data:** None.
- **Default Label:** TmDay.
- **Toggles:** Yes.
- **Status Indication:** Yes.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                | T-Series,                                                                              |

  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

## Time Profile

You can manually override a time profile. The override settings allow you to mix timed and manual settings.

The button indicator will show the Time Profile state and pressing the button will present a menu with five options and an indication of the current state. The menu options are listed below.

| Menu Option                             | Description                                                                                                                              |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Timed Operation</b>                  | No override. The time profile operates as configured.                                                                                    |
| <b>Active Until Next Timed Inactive</b> | Use for time profiles with multiple intervals. Select to make the current timed interval active until the next inactive interval.        |
| <b>Inactive Until Next Timed Active</b> | Use for time profiles with multiple intervals. Select to make the current active timed interval inactive until the next active interval. |
| <b>Latch Active</b>                     | Set the time profile to active. Timed inactive periods are overridden and remain active.                                                 |
| <b>Latch Inactive</b>                   | Set the time profile to inactive. Timed active periods are overridden and remain inactive.                                               |

## Details

- **Action:** Emulation | Time Profile
- **Action Data:** Time profile name.
- **Default Label:** TP or Time Profile
- **Toggles:** No.
- **Status Indication:**

---

## Timer

Starts a timer running on the display of the user's extension. The timer disappears when the user ends a call.

This function can be used on Avaya phones (except 9600 Series) that display a call timer next to each call appearance. The button will temporarily turn the call timer on or off for the currently selected call appearance. The change only applies for the duration of the current call.

- **Action:** Emulation | Timer.
- **Action Data:** None.
- **Default Label:** Timer.
- **Toggles:** Yes.
- **Status Indication:** No.

### Details

  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Transfer

This function is intend for use with Avaya M-Series and T-Series phones only. When pressed, the button invokes the same transfer process as dialing **Feature 70**.

### Details

- **Action:** Advanced | Call | Transfer.
- **Action Data:** None.
- **Default Label:** Xfer.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.

---

## Toggle Calls

Cycle between the user's current call and any held calls.

### Details

- **Action:** Advanced | Call | Toggle Calls..
- **Action Data:** None.
- **Default Label:** Togg.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Twinning

This action can be used by user's setup for mobile twinning. This action is not used for internal twinning.

While the phone is idle, the button allows the user to set and change the destination for their twinned calls. It can also be used to switch mobile twinning on/off and indicates the status of that setting.

When a call has been routed by the system to the user's twinned destination, the **Twinning** button can be used to retrieve the call at the user's primary extension.

In configurations where the call arrives over an IP trunk and the outbound call is on an IP trunk, multi-site network may optimise the routing and in this case the button may not be usable to retrieve the call.

**Mobile Twinning Handover** When on a call on the primary extension, pressing the **Twinning** button will make an unassisted transfer to the twinning destination. This feature can be used even if the user's **Mobile Twinning** setting was not enabled.

During the transfer process the button will wink. Pressing the twinning button again will halt the transfer attempt and reconnect the call at the primary extension.

The transfer may return if it cannot connect to the twinning destination or is unanswered within the user's configured **Transfer Return Time** (if the user has no **Transfer Return Time** configured, a enforced time of 15 seconds is used).

### Details

- **Action:** Emulation | Twinning.

- **Action Data:** None.
- **Default Label:** Twinning.
- **Toggles:** Yes.
- **Status Indication:** Yes.

| Status                      | 1400, 1600, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                | M-Series, T-Series                                                                     |

  - M-Series and T-Series.
  - 1100 Series and 1200 Series.
  - This button action is also supported by the Vantage Connect Expansion application.

## Unpark Call

This function is obsolete, since the Call Park function can be used to both park and retrieve calls and provides visual indication of when calls are parked. Retrieve a parked call from a specified system park slot.

### Details

- **Action:** Advanced | Call | Unpark Call.
- **Action Data:** System park slot number. This must match a park slot ID used to park the call.
- **Default Label:** UnPark.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

## User

Monitors whether another user's phone is idle or in use. The **Telephone Number** field should contain the user's name enclosed in double quotes. On buttons with a text label, the user name is shown.

The actions performed when the button is pressed depend on the state of the target user and the type of phone used. It also depend on whether the user is local or on a remote multi-site network system.

| Target User Status                                                   | Large display 1400, 1600, 9400, 9500, 9600, M-Series and T-Series Phones                                                                                                                                                                                                                                                                                                                                        | Other Phones or across a multi-site network                                                                                                                                                                           |

| <b>On a Call</b> (Fast flash)<br><br><b>Do Not Disturb</b> (Lamp on) | <ul style="list-style-type: none"> <li>• <b>Call:</b> Make a call to the user.</li> <li>• <b>Message:</b> Cause a single burst of ringing on the target phone. On some phones, when they end any current call, the phone displays PLEASE CALL and your extension number.</li> <li>• <b>Voicemail:</b> Call the user's voicemail mailbox.</li> <li>• <b>Auto Callback:</b> Set an automatic callback.</li> </ul> | <ul style="list-style-type: none"> <li>• <b>Call:</b> Make a call to the user.</li> <li>• <b>Voicemail:</b> Call the user's voicemail mailbox.</li> <li>• <b>Auto Callback:</b> Set an automatic callback.</li> </ul> |

### Using a User button with other buttons

You can use a **User** button to indicate the target user when pressing another button that has no configured target user. In cases where the other button uses the phone display for target selection, this is only possible using **User** buttons on a button module.

### Overriding the display of call options

For IP Office 12.2, you can use the NoUser Source Number `DISABLE_USERBLF_DND_MENU` to override the display of call options shown in the table above and instead have the button make an immediate call to the targeted user. Supported with 9400, 9500, 9600, and J100 Series phones.

For the call to alert a DND user rather than be redirected as per normal DND operation, you must add the button user's number to the targeted user's **DND Exceptions** list.

### Logged out user status display

The IP Office determines the status for logged out users as follows:

- **Logged Out User without Mobile Twinning:**
  - If the user has **Forward Unconditional** enabled, they are shown as idle.
  - If the user does not have **Forward Unconditional** enabled, they are show as if on DND.
- **Logged Out with Mobile Twinning On:**
  - If there are any calls alerting or in progress through the system to the twinned destination, the user status is shown as alerting or in-use as appropriate. This includes the user

showing as busy/in-use if they have such a call on hold and they have **Busy on Held** enabled.

- If the user enables DND through Mobile Call Control or one-X Mobile client, their status will show as DND.
- Calls from the system direct to the user's twinned destination number, rather than redirected by twinning, will not change the user's status.

## Details

- **Action:** User.
- **Action Data:** User name enclosed in "double-quotes".
- **Default Label:** <the user name>.
- **Toggles:** No.
- **Status Indication:** Yes.

  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

## Visual Voice

This action provides the user with a menu for access to voicemail mailboxes. The menu provides the user with options for listening to messages, leaving messages and managing the mailbox. If no action data is specified, then it is the user's mailbox. Action Data can be used to specify the mailbox of another user or group.

### Note:

You can also use the "H" and "U" user source numbers to add another mailbox to your Visual Voice menu. See **Call Management > Users > Add/Edit Users > Source Numbers**

If the Action Data has been configured, pressing the button for an incoming call or while a call is connected sends the call to the user mailbox specified in the action data. If no Action Data is configured, the user is prompted to enter a mailbox.

On phones that have a display but do not support full visual voice operation as indicated below, use the button for user mailbox access using voice prompts and for direct to voicemail transfer during a call is supported.

Access to Visual Voice on supported phones can be triggered by the phone's **MESSAGES** button rather than requiring a separate Visual Voice programmable button. This is done using the option **System Settings > System > Voicemail > Messages button goes to Visual Voice**.

## Details

- **Action:** Emulation | Visual Voice.
  - **Action Data:** All local users and groups and all users and groups on systems in the network, except for the user on which the button is being programmed.
  - **Default Label:** Voice.
  - **Toggles:** No.
  - **Status Indication:** When action data is configured, the status lamp provides a message waiting indicator for the monitored mailbox.
  - **User Admin:** No.
  - **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
    - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
    - 1400 Series and 1600 Series.
1. Takes the user direct to the listen part of Visual Voice. For the full Visual Voice menu options, the user should use **Menu | Settings | Voicemail Settings**.

## Visual Voice Controls

The arrangement of options on the screen will vary depending on the phone type and display size.

| Option          | Description                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Listen</b>   | Access your own voicemail mailbox. When pressed the screen will show the number of <b>New</b> , <b>Old</b> and <b>Saved</b> messages. Select one of those options to start playback of messages in that category. Use the ▲ up arrow and ▼ arrow keys to move through the message. Use the options below. |
| <b>Listen</b>   | Play the message.                                                                                                                                                                                                                                                                                         |
| <b>Pause</b>    | Pause the message playback.                                                                                                                                                                                                                                                                               |
| <b>Delete</b>   | Delete the message.                                                                                                                                                                                                                                                                                       |
| <b>Save</b>     | Mark the message as a saved message.                                                                                                                                                                                                                                                                      |
| <b>Call</b>     | Call the message sender if a caller ID is available.                                                                                                                                                                                                                                                      |
| <b>Copy</b>     | Copy the message to another mailbox. When pressed a number of additional options are displayed.                                                                                                                                                                                                           |
| <b>Message</b>  | Record and send a voicemail message to another mailbox or mailboxes.                                                                                                                                                                                                                                      |
| <b>Greeting</b> | Change the main greeting used for callers to your mailbox. If no greeting has been recorded then the default system mailbox greeting is used.                                                                                                                                                             |

*Table continues...*

| Option              | Description                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mailbox Name</b> | Record a mailbox name. This feature is only available on systems using Embedded Voicemail.                                                                                                                                                                                                                                                                                                              |
| <b>Email</b>        | This option is only shown if you have been configured with an email address for voicemail email usage in the system configuration. This control allows you to see and change the current voicemail email mode being used for new messages received by your voicemail mailbox. Use <b>Change</b> to change the selected mode. Press <b>Done</b> when the required mode is displayed. Possible modes are: |
| <b>Password</b>     | Change the voicemail mailbox password. To do this requires entry of the existing password.                                                                                                                                                                                                                                                                                                              |
| <b>Voicemail</b>    | Switch voicemail coverage on/off.                                                                                                                                                                                                                                                                                                                                                                       |

---

## Voicemail Collect

Connects to the voicemail server. The telephone number must indicate the name of the Voicemail box to be accessed, eg. "?Extn201" or "#Extn201". The ? indicates "collect Voicemail" and the # indicates "deposit Voicemail". This action is not supported by voicemail using Intuity emulation mode.

When used with Voicemail Pro, names of specific call flow start points can also be used to directly access those start points via a short code. In these cases ? is not used and # is only used if ringing is required before the start points call flow begins.

### Details

- **Action:** Advanced | Voicemail | Voicemail Collect.
  - **Action Data:** See above.
  - **Default Label:** VMCol or VMail Collect.
  - **Toggles:** No.
  - **Status Indication:** No.
  - **User Admin:** No.
  - **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
    - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
    - 1400 Series and 1600 Series.
    - M-Series and T-Series.
1. For access to the users own mailbox, this button is equivalent to **Feature 65** and **Feature 981**.

## Voicemail Off

Disables the user's voicemail box from answering calls that ring unanswered at the users extension. This does not disable the user's mailbox and other methods of placing messages into their mailbox.

This button function is obsolete as the Voicemail On function toggles on/off.

### Details

- **Action:** Advanced | Voicemail | Voicemail Off.
- **Action Data:** None.
- **Default Label:** VMOff.
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - 1100 Series and 1200 Series.

## Voicemail On

Enables the user's voicemail mailbox to answer calls which ring unanswered or arrive when the user is busy.

### Details

- **Action:** Advanced | Voicemail | Voicemail On.
- **Action Data:** None.
- **Default Label:** VMOOn or VMail On.
- **Toggles:** Yes.
- **Status Indication:** Yes.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                  | T-Series,                                                                                |

| Off    | Off                    | Off              |  Grey  | Off                                                                                      |

- **User Admin:** No.

- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
  - 1400 Series and 1600 Series.
  - M-Series and T-Series.
  - 1100 Series and 1200 Series.
  - This button action is also supported by the Vantage Connect Expansion application.

---

## Voicemail Ringback Off

Disables voicemail ringback to the user's extension. This button function is obsolete as the Voicemail Ringback On function toggles on/off.

### Details

- **Action:** Advanced | Voicemail | Voicemail Ringback Off.
- **Action Data:** None.
- **Default Label:** VMRB-
- **Toggles:** No.
- **Status Indication:** No.
- **User Admin:** No.
- **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
  - 1400 Series and 1600 Series.

---

## Voicemail Ringback On

Enables voicemail ringback to the user's extension. Voicemail ringback is used to call the user when they have new voicemail messages in their own mailbox or a hunt group mailbox for which they have been configured with message waiting indication.

The ringback takes place when the user's phone returns to idle after any call is ended.

### Details

- **Action:** Advanced | Voicemail | Voicemail Ringback On.
- **Action Data:** None.
- **Default Label:** VMRB+ or VMail Ringback.
- **Toggles:** Yes.

- **Status Indication:** Yes.

| Status | 1400, 1600, 9400, 9500 | 9608, 9611, J100 | 9621, 9641                                                                                | T-Series,                                                                              |

  - 1400 Series and 1600 Series.
  - M-Series and T-Series.

---

## Whisper Page

This feature allows you to intrude on another user and be heard by them without being able to hear the user's existing call which is not interrupted.

For example: User A is on a call with user B. When user C intrudes on user A, they can be heard by user A but not by user B who can still hear user A. Whisper page can be used to talk to a user who has enabled private call.

- Intrusion features are controlled by the **Can Intrude** setting of the user intruding and the **Cannot Be Intruded** setting of user being intruded on. By default, no users can intrude and all users cannot be intruded.

The system support a range of other call intrusion methods in addition to this feature.

### Details

- **Action:** Advanced | Call | Whisper Page.
  - **Action Data:** User number or name or blank for entry when pressed.
  - **Default Label:** Whisp or Whisper Page.
  - **Toggles:** No.
  - **Status Indication:** No.
  - **User Admin:** No.
  - **Phone Support:** Note that support for particular phone models is also dependent on the system software level.
    - 9400 Series, 9500 Series, 9600 Series, and J100 Series.
    - 1400 Series and 1600 Series.
1. Not supported on non-IP telephones when using a headset.

# Part 15: Call Appearance Buttons

## Appearance Buttons

Many Avaya phones supported on system have a programmable keys or buttons (the terms 'key' and 'button' mean the same thing in this context). A wide range of actions can be assigned to those buttons, see [Button Programming Actions](#) on page 1089.

These actions can be assigned to the programmable buttons on a user's phone. Those 'appearance' buttons can then be used to answer, share, switch between and in some case make calls. This type of call handling is often called 'key and lamp mode'.

The following sections in this documentation relate to a set of button actions collectively called 'appearance' actions. These are:

| Appearance Button Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call Appearances</b>    | <p>Call appearance buttons are used to display alerts for incoming calls directed to a user's extension number or to a hunt group of which they are a member. *Table continues...*

| Appearance Button Type           | Description                                                                                                                                                                                                                                                     |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Call Coverage Appearances</b> | Line appearance buttons allow specific individual line to be used when making calls or answered when they have an incoming call. It also allows users to bridge into calls on a particular line.<br><br>See <a href="#">Call Coverage Buttons</a> on page 1214. |

 **Note:**

- For all the examples within this documentation, it is assumed that **Auto Hold** is on and **Answer Pre-Select** is off unless otherwise stated.
- The text shown on phone displays in the examples are typical and may vary between phone types, locales and system software releases.

# Chapter 106: Call Appearance Buttons

Call appearance buttons are used to display alerts for incoming calls directed to a user's extension number or to a hunt group of which they are a member. Call appearance buttons are also used to make outgoing calls.

By having several call appearance buttons, a user is able to be alerted about several calls, select which call to answer, switch between calls and take other actions.

When all the user's call appearance buttons are in use or alerting, any further calls to their extension number receive busy treatment. Instead of busy tone, the user's forward on busy is used if enabled or otherwise voicemail if available.

Call appearance buttons are the primary feature of key and lamp operation. None of the other appearance button features can be used until a user has some call appearance button programmed[1].

There are also additional requirements to programming call appearance buttons:

- Call appearance buttons must be the first button programmed for the user.
- Programming a single call appearance button for a user is not supported. The normal default is 3 call appearances per user except on phones where only two physical buttons are available.

## Call Appearance Example 1

In this example, the user has multiple call appearance buttons.

|                                                                                    |                                                                                                                                                                                                                                                                        |
|------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | <b>Phone Idle</b> The phone is currently idle.                                                                                                                                                                                                                         |
|   | <b>First Call Alerts</b><br>A call arrives. It alerts against the first available call appearance button. Pressing that button will answer the call.                                                                                                                   |
|   | <b>Call Answered</b><br>The call is now connected.                                                                                                                                                                                                                     |
|   | <b>Second Call Alerts</b><br>A second call arrives whilst the first is still connected. It alerts against the next available call appearance button. As the user has a call in progress, the alert gives just a single ring and briefly display details of the caller. |
|  | <b>Pressing the Second Call Appearance</b><br>Pressing the second call appearance button will hold the first call and answer the second.                                                                                                                               |

## Call Appearance Example 2

In this example, the user will use their call appearances to make two calls and start a conference between those calls.

|                                                                                     |                                                                                                                                                                                                              |
|-------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <b>Initial Call</b><br>The user has a call in progress, shown on their first call appearance button. It is decided to conference another user into the call.                                                 |
|  | <b>Make Conference Enquiry</b><br>Pressing the <b>CONFERENCE</b> button on the users phone automatically places the current call on hold and takes the phone off hook on the next available call appearance. |

*Table continues...*

|                                                                                   |                                                                                                                                                                                         |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <p><b>Enquiry in Progress</b></p> <p>The other extension has been dialed and invited to join a conference call. The user presses the <b>CONFERENCE</b> button on their phone again.</p> |
|  | <p><b>Conference Starts</b></p> <p>The conference call has started. The separate call appearances have collapsed to a single appearance that represents the conference.</p>             |

# How are Call Appearance Buttons Treated?

## For incoming calls

- **Call Waiting** settings are ignored except for hunt group call waiting where the call waiting tone is replaced by an alert on a call appearance button if available.
- **Follow Me**, **Forward Unconditional** and **Forward Hunt Group Calls** are used when set.
- If **Do Not Disturb** is set, only calls from numbers in the user's Do Not Disturb Exception list will alert if a call appearance is available.

## Busy status

In both cases below, even when busy, the user may still receive alerts on other appearance buttons.

- **For calls direct to the user's extension number** The user is busy when all their available call appearances are in use. Instead of busy tone, the user's forward on busy is used if enabled or otherwise voicemail if available.
- **For calls to a hunt group of which the user is a member** The user is busy to further hunt group calls when they have any appearance button in use on their phone. The only exception is calls to a collective hunt group with call waiting.

## For outgoing calls

- Outgoing calls are treated exactly the same as calls made by non-appearance button users.
- External Calls made on a call appearance, which route out on a line for which the user also has a line appearance, will remain on the call appearance. The line appearance will indicate 'in use elsewhere'.

## For call appearance buttons matched by a bridged appearance button

- If the bridged appearance is used to make or answer calls, the state of the call appearance will match that of the bridged appearance.
- If the call is put on hold by the bridged appearance user, the call appearance will show 'on hold elsewhere'.

## Other

- **Held/Parked Call Timeout** If the user has parked a call, the parked call timer only starts running when the user is idle rather than on another call.
- Incoming calls routed directly to the user as the incoming call routes destination on a line for which the user also has a line appearance, will only alert on the line appearance. These calls do not follow any forwarding set but can be covered.

# Call Appearance Button Indication

On phones with a text display area next to the button, by default **a=**, **b=** and so on is displayed. This can be replaced by another label if required.

When the user is not connected to a call, the button indicated as selected is the button that will be used if the user goes off hook without pressing an appearance button. When a user is connected to a call, that call is the selected button.

The following table shows how the different states of call appearance buttons (alerting, held, etc) are indicated. This is a general table, not all phone button types are covered. The ring that accompanies the visual indication can be delayed or switched off. See [Ring Delay](#) on page 1231.

| Icon Button                    | Dual LED Button                 | Appearance Button State                                                                                                                                                          |

# Chapter 107: Bridged Appearance Buttons

A bridged appearance button shows the state of one of another user's call appearance buttons. It can be used to answer or join calls on that user's call appearance button. It can also be used to make a call that the call appearance user can then join or retrieve from hold.

When the user's call appearance button alerts, any associated bridged appearance buttons on other user's phones also alert. The bridged appearance buttons can be used to answer the call on the call appearance button user's behalf.

When the call appearance button user answers or makes a call, any associated bridged appearance buttons on other users' phones show the status of the call, ie. active, on hold, etc. The bridged appearance button can be used to retrieve the call if on hold or to join the call if active (subject to intrusion permissions).

**Note** Bridged appearance buttons are different from the action of bridging into a call (joining a call). See Joining Other Calls (Bridging).

Bridged appearance buttons are not supported between users on different systems in a multi-site network.

## How are Bridged Appearances Treated?

Bridged appearance buttons operate in parallel with their matching call appearance button.

- **Whose user settings control the call?** Until answered on a bridged appearance button, calls alerting on a bridged appearance button follow the settings of the user or hunt group to which the call was originally directed.
- If the call appearance is in use, any matching bridged appearance will indicate the same.
- If a bridged appearance is in use, the call appearance it matches will indicate the same.
- The bridge appearance will only alert if the call appearance is alerting. For example, direct intercom and paging call to the call appearance will show on the bridged appearance but will not give any audible alert.
- If the bridged appearance user put the call on hold, the call appearance indicates 'on hold elsewhere'.
- Bridged appearances to a user who has logged out, or has logged into a phone without appearance buttons will not operate.
- If the bridged appearance user has 'do not disturb' (DND) enabled, the bridge appearance button icon or lamps operates but alerting and ringing line preference selection is not applied unless the caller is in the user's DND exception list.
- Bridged appearance buttons are not supported between users on different systems in a multi-site network.

# Chapter 108: Call Coverage Buttons

Call coverage allows a user to be alerted when another user has an unanswered call.

The user being covered does not necessarily have to be a key and lamp user or have any programmed appearance buttons. Their Individual Coverage Time setting (default 10 seconds) sets how long calls will alert at their extension before also alerting on call coverage buttons set to that user.

The user doing the covering must have appearance buttons including a call coverage appearance button programmed to the covered user's name.

Call coverage appearance buttons are not supported between users on different systems in a multi-site network.

# How is Call Coverage Treated?

**Whose user settings control the call ?**

Until answered, calls alerting on a call coverage button follow the settings of the user to which the call was originally directed.

Once answered, the call follows the user settings of the user who answered it.

**Coverage is applied to :**

- Internal calls dialed to the covered user's extension number.
- External calls routed to the covered user by a incoming call route.
- Calls forwarded internally by the covered user or on follow me from the covered user.

**Coverage is not applied to :**

- Hunt group calls to a hunt group of which the covered user is a member.
- Calls forwarded to the covered user using forward or follow me functions.
- Calls alerting on the covered user's bridged appearance and call coverage buttons.
- Coverage is only applied to calls alerting on a line appearance if the call was also routed to that user by an incoming call route.
- Page and intercom calls.
- Parked, transferred and held calls ringing back to the user.
- Automatic callback calls set by the covered user.
- Voicemail ringback calls.
- Call coverage appearance buttons are not supported between users on different systems in a multi-site network.

**Coverage is applied :**

- If the covered user's phone is available, call coverage is applied only after the covered user's Individual Coverage Time has expired.
- If the covered user's phone is busy, call coverage is applied immediately.
- If the covered user is using follow me or forward all to an internal number to divert their calls, call coverage is still applied.
- If the covered user has 'do not disturb' on, call coverage is applied immediately except for calls from numbers in the covered user's do not disturb exceptions list.

**Other items :**

If the call is not answered after the covered user's **No Answer Time** it will go to the covered user's voicemail if available or follow their forward on no answer settings.

If the covered user has several alerting calls, the call answered by the call coverage button is the covered user's longest ringing call.

Calls will not alert at a covering user who has 'do not disturb' enabled, except when the calling number is in the covering user's do not disturb exception list.

# Chapter 109: Line Appearance Buttons

Line appearance buttons allow specific individual line to be used when making calls or answered when they have an incoming call. It also allows users to bridge into calls on a particular line.

Incoming call routing is still used to determine the destination of all incoming calls. Line appearance buttons allow a call on a specific line to alert the button user as well as the intended call destination. When these are one and the same, the call will only alert on the line appearance but can still receive call coverage.

When alerting on suitable phones, details of the caller and the call destination are shown during the initial alert.

Individual line appearance ID numbers to be assigned to selected lines on a system. Line appearance buttons are only supported for analog, E1 PRI, T1, T1 PRI, and BRI PSTN trunks; they are not supported for other trunks including E1R2, QSIG and IP trunks.

Line appearance buttons are not supported for lines on remote systems in a multi-site network.

## Using Line Appearances for Outgoing Calls

In order to use a line appearance to make outgoing calls, changes to the normal external dialing short codes are required. For full details see [Outgoing Line Programming](#) on page 1246.

## Private Lines

Special behavior is applied to calls where the user has both a line appearance for the line involved and is also the Incoming Call Route destination of that call. Such calls will alert only on the Line Appearance button and not on any other buttons. These calls will also not follow any forwarding.

## How are Line Appearances Treated?

### Incoming Calls

- **Until answered using a line appearance button, incoming calls alerting on a line appearance, follow the settings of the incoming call route's destination group or user. They do not follow the settings of any line appearance user.**
- If an incoming calls destination is voicemail, or once the incoming call has passed from its destination to voicemail, it cannot be answered or bridged into using a line appearance button.
- If the line appearance user is also the incoming call route destination for the call, the call will alert on their line appearance only. In this case:
  - It will alert on the line appearance even if all call appearances are in use.
  - The call will not follow any of the user's forwarding settings .
  - The call will receive call coverage from other user's with call coverage buttons set to the line appearance user.
  - The ring delay used is that of the first free call appearance.

- For analog lines set to ICLID, any line appearances show active while the system waits for ICLID information. During this time the line has not been routed and cannot be answered using a line appearance button.
- Calls alerting on a line appearance can also alert on a call coverage appearance on the same phone. If Ringing Line Preference is set, the current selected button will change from the line appearance to the call coverage appearance.
- If the line appearance user has do not disturb (DND) enabled, the line appearance button icon or lamps will still operate but alerting and ringing line preference selection are not applied unless the caller is in their DND exception list.

### Outgoing Calls

- In order to be used for making outgoing calls, some additional system programming may be required. See [Outgoing Line Programming](#).
- Calls made on a call appearance, which are routed out on a line for which the user also has a line appearance, will remain on the call appearance. The line appearance will indicate 'in use elsewhere'.

### Additional Notes

- Line appearance buttons are not supported for lines on remote systems in a multi-site network.
- Where a line appearance button is used to answer a call for which automatic call recording is invoked, the recording will go to the automatic recording mailbox setting of the original call destination.
- If a call indicated by a line appearance is parked, it cannot be joined or unparked by using another line appearance.
- Calls alerting on a line appearance do not receive call coverage or go to a users voicemail unless the user was the call's original incoming call route destination.

## Line Appearance Button Indication

On phones with a text display area next to the button, the label **Line** and the line number are displayed.

When the user is not connected to a call, the button indicated as selected is the button that will be used if the user goes off hook without pressing an appearance button. When a user is connected to a call, that call is the selected button.

The following table shows how the different states of call appearance buttons (alerting, held, etc) are indicated. This is a general table, not all phone button types are covered. The ring that accompanies the visual indication can be delayed or switched off. See [Ring Delay](#) on page 1231.

| Icon Button                                                                                                    | Dual LED Button                      | Appearance Button State                                                                                                                                                       |

# Chapter 110: Appearance Button Features

Appearance functions are only supported on Avaya phones which have programmable buttons and also support multiple calls. Appearance functions are also only supported on those buttons that have suitable adjacent indicator lamps or a display area. Appearance buttons are not supported across a multi-site network.

## Selected Button Indication

During appearance button usage, one of the user's appearance buttons may be indicated as the user's current selected button. This is the appearance button already in use, or if idle, the appearance button that will be used if the user goes off hook by lifting the handset.

On phones with a display area next to each button, the current selected button is indicated by either an \_ underscore of the button label, or a shaded background. On phones with twin LED lamps, the current selected button is indicated by the red lamp being on.

The system sets which appearance button is the current selected button using the following methods:

| Method                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Idle Line Preference</b>    | This feature can be set on or off for each individual user, the default is on. When on, it sets the current selected button as the first available idle call/line appearance button. See <a href="#">Idle Line Preference</a> on page 1225.                                                                                                                                                                                          |
| <b>Ringing Line Preference</b> | This feature can be set on or off for each individual user, the default is on. When on, it sets the current selected button as the button which has been alerting at the user's phone for the longest. <b>Ringing Line Preference</b> overrides <b>Idle Line Preference</b> . See <a href="#">Ringing Line Preference</a> on page 1227.                                                                                              |
| <b>Delayed Ring Preference</b> | This setting is used in conjunction with ringing line preference and appearance buttons set to delayed or no ring. It sets whether ringing line preference should observe or ignore the delayed ring applied to the user's appearance buttons when determining which button should have current selected button status.                                                                                                              |
| <b>User Selection</b>          | The phone user can override both <b>Idle Line Preference</b> and <b>Ringing Line Preference</b> by pressing the appearance button they want to use or answer. That button will then remain the current selected button whilst active.<br><br>If the user currently has a call connected, pressing another appearance button either holds or disconnect that call. The action is determined by the system's <b>Auto Hold</b> setting. |

### Answer Pre-Select

Normally when a user has multiple alerting calls, only the details of the call on current selected button are shown. Pressing any of the alerting buttons will answer the call on that button, going off-hook will answer the current selected button.

Enabling the user telephony setting **Answer Pre-Select** allows the user to press any alerting button to make it the current selected button and displaying its call details without answering that call. To answer a call when the user has **Answer Pre-Select** enabled, the user must press the alerting button to display the call details and then either press the button again or go off-hook.

## Idle Line Preference

Idle Line Preference determines the user's currently selected button as the first available idle call/line appearance button. Selected button indication is applied to that button and if the user goes off-hook, for example by lifting their handset, an outgoing call is started on that button.

- **?Why Would I Use Just Idle Line Preference** In environments that are focused on making outgoing calls, for example telemarketing, incoming calls are infrequent and user's go off-hook expecting to make a call. Using **Idle Line Preference** without **Ringing Line Preference** ensures that the user doesn't inadvertently answer a call when expecting to make a call.
- If all the available call/line appearance buttons are in use, no current selected button choice is made by **Idle Line Preference**. In this case, going off hook will have no effect.

- For appearance button users with **Idle Line Preference** off, going off-hook (lifting the handset or pressing **SPEAKER**, **HEADSET**, etc) will have no effect until an appearance button is pressed.
- By default **Idle Line Preference** is on for all users.
- **Idle Line Preference** is overridden by **Ringing Line Preference** if also on for the user.

### Idle Line Preference Example 1

In this example, only **Idle Line Preference** has been programmed for the user. **Ringing Line Preference** has not been programmed.

|                                                                                    |                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | <p><b>Phone Idle</b></p> <p>The phone is idle. The current selected button determined by Idle Line Preference is the first available idle call appearance button. This is shown by the _ underscore of the button text.</p>                                                                                                                           |
|   | <p><b>First Call to User</b></p> <p>A call for the user arrives. It alerts on the first available call appearance button. Idle Line Preference has changed the current selected button to the next available idle call appearance.</p>                                                                                                                |
|  | <p><b>User Goes Off Hook</b></p> <ol style="list-style-type: none"> <li>1. With the call still alerting, if the user goes off hook, it will be interpreted as making a call using the currently selected button, not as answering the alerting button.</li> <li>2. To answer the alerting call, the user should press the alerting button.</li> </ol> |

### Idle Line Preference Example 2

In this example, only **Idle Line Preference** has been programmed for the user. **Ringing Line Preference** has not been programmed.

|                                                                                     |                                                                                                                                                                                                                         |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <p><b>Two Calls Alerting</b></p> <p>The users has two incoming calls alerting. Idle Line Preference has set the currently selected button to their third call appearance.</p>                                           |
|  | <p><b>First Caller Abandons</b></p> <p>If the first incoming caller disconnects, the currently selected button changes to the first call appearance as this is now the first available idle call appearance button.</p> |

### Idle Line Preference Example 3

In this example, both **Idle Line Preference** and **Ringing Line Preference** are set for the user.

|                                                                                     |                                                                                                                                                      |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <p><b>Phone Idle</b></p> <p>The phone is idle and <b>Idle Line Preference</b> has assigned current selected button to the first call appearance.</p> |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|

*Table continues...*

|                                                                                   |                                                                                                                                                                    |
|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <b>Call Alerting</b><br>A call has arrived and <b>Ringing Line Preference</b> keeps the current selected button at the first call appearance.                      |
|  | <b>Call Answered</b><br>With the call answered it retains current selected button status.                                                                          |
|  | <b>Call Held</b><br>When the call is put on hold, <b>Idle Line Preference</b> assigns current selected button status to the next available call appearance button. |

### Idle Line Preference Example 4

In this example, only **Idle Line Preference** has been programmed for the user. **Ringing Line Preference** has not been programmed.

|                                                                                   |                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <b>All Call Appearances Alerting</b><br>In this case, all the users call appearance buttons are alerting incoming calls. Idle Line Preference has changed the currently selected button to the first available line appearance. |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Ringing Line Preference

Ringing Line Preference determines the user's currently selected button as the button which has been alerting the longest. Selected button indication is applied to that button and if the user goes off-hook, for example by lifting their handset, the alerting call on that button is answered.

- Ringing Line Preference includes calls alerting on call appearance, line appearance, bridged appearance and call coverage buttons.
- **Ringing Line Preference overrides Idle Line Preference.**
- By default **Ringing Line Preference** is on for all users.
- **Ringing Line Preference Order** When a user's longest waiting call alerts on several of the user's appearance buttons and Ringing Line Preference is set for the user, the order used for current selected button assignment is;
  - Call appearance.
  - Bridged appearance.
  - Call coverage.

- Line appearance.

- **Example:**

A user has a call to a covered user alerting initially on a line appearance button. Ringing Line Preference assigns current selected button status to the line appearance. When the same call also begins to alert on the call coverage appearance button, current selected button status switches to the call coverage appearance button.

- **Ring Delay and Ringing Line Preference**

Appearance buttons can be set to **Delayed Ring** or **No Ring**. These buttons still alert visually but do not give an audible ring or tone. Ringing line preference is still applied to alerting buttons even if set to **Delayed Ring** or **No Ring**.

- **Delayed Ring Preference**

For users with **Ringing Line Preference** selected, their **Delayed Ring Preference** setting sets whether ringing line preference is used or ignores buttons that are visually alerting but have **Delayed Ring** or **No Ring** set. The default is off, ie. ignore ring delay.

### Ringing Line Preference Example 1

In this example, both **Ring Line Preference** and **Idle Line Preference** have been set for the user. They also have **Ringing Line Preference** on and **Auto Hold** is on. **Answer Pre-Select** is off.

|                                                                                     |                                                                                                                                                                                                                                                                               |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | <p><b>Phone Idle</b></p> <p>The phone is idle. The current selected button has been determined by Idle Line Preference as the first available idle call appearance button. This is shown by the _ underscore next to that button.</p>                                         |
|  | <p><b>First Call Alerting</b></p> <p>A call for the user arrives. It alerts on the first available call appearance button. Ringing Line Preference uses this as the currently selected button as it is the only alerting call.</p>                                            |
|  | <p><b>Second Call Alerting</b></p> <p>Another call for the user arrives. It alerts on the next available call appearance button. As the first call has been alerting longer, under Ringing Line Preference it retains the currently select button status.</p>                 |
|  | <p><b>The First Call Abandons</b></p> <p>The first caller disconnects. Ringing Line Preference changes the currently selected button status to the second call appearance button.</p>                                                                                         |
|  | <p><b>Another Call Arrives</b></p> <p>Another call arrives. It alerts as the first free call appearance button. However the call at the second call appearance has been alerting longer and so under Ringing Line Preference retain the currently selected button status.</p> |

### Ringing Line Preference Example 2

In this example, the user has both Ring Line Preference and Idle Line Preference programmed. They also have **Ringing Line Preference** on and **Auto Hold** is on. **Answer Pre-Select** is off.

|                                                                                   |                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <b>First Call to User</b><br>A call for the user arrives. It alerts on the first available call appearance button. Ringing Line Preference uses this as the currently selected button as it is the only alerting call.                                                                                   |
|  | <b>Call on Line 601</b><br>The user's Line Appearance is alerting due to an incoming call on the associated line. Details of the call and its destination are shown. Ringing Line Preference keeps the currently selected button status on the call appearance button as this has been alerting longest. |
|  | <b>Second Call to User</b><br>A second call to the user arrives and alerts on the second call appearance button. Ringing Line Preference keeps the currently selected button status on the call appearance button as this has been alerting longest.                                                     |
|  | <b>The First Caller Abandons</b><br>The first call to the user disconnects. Ringing Line Preference passes the currently selected button status to the Line Appearance button as this has been alerting longest.                                                                                         |

# Answer Pre-Select

On some phones, only the details of the call alerting or connected on the current selected button are shown. The details of calls alerting on other buttons are not shown or only shown briefly when they are first presented and are then replaced again by the details of the call on the current selected button.

By default, pressing any of the other alerting buttons will answer the call on that button. Answer pre-select allows a user to press alerting buttons other than the current selected button without actually answering them. Instead the button pressed becomes the current selected button and its call details are displayed.

Note that using answer pre-select with a currently connected call will still either hold or end that call in accordance with the system's Auto Hold setting.

## Answer Pre-Select Example 1

|                                                                                     |                                                                                                                                                                                                                         |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <b>Phone Idle</b> The phone is idle. The current selected button has been determined by Idle Line Preference as the first available idle call appearance button. This is shown by the _ underscore next to that button. |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Table continues...

|                                                                                   |                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <b>First Call Alerting</b> A call for the user arrives. It alerts on the first available call appearance button. Ringing Line Preference uses this as the currently selected button as it is the only alerting call.                                            |
|  | <b>Second Call Alerting</b> Another call for the user arrives. It alerts on the next available call appearance button. As the first call has been alerting longer, under Ringing Line Preference it retains the currently select button status.                 |
|  | <b>The User Presses the Second Call Appearance</b> Pressing the second call appearance overrides ringing line preference and assigns current selected button status to the button without actually answering the call. The details of the caller are displayed. |
|  | <b>The User Answers the Call</b> The user can press the button again to answer the call or just go off-hook to answer as it is now the currently selected button.                                                                                               |

# Auto Hold

Auto Hold is a system wide feature that affects all appearance button users. This feature determines what happens when a user, who is already on a call, presses another appearance button. The options are:

- If **Auto Hold** is **off**, the current call is disconnected.
- If **Auto Hold** is **on**, the current call is placed on hold.

## Auto Hold Example 1

In this example, the user has two calls currently shown on call appearance buttons. **Answer Pre-Select** is off.

|                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

[Appearance Button Features](#) on page 1224

## Ring Delay

Ring delay can be applied to appearance buttons. This option can be used with all types of appearance buttons and can be selected separately for each appearance button a user has. Using ring delay does not affect the buttons visual alerting through the display and display icons or button lamps.

Ring delay is typically used with line appearance buttons for lines which a user wants to monitor but does not normally answer. However ring delay can be applied to any type of appearance button.

The selectable ring delay options for an appearance button are listed below. The option is selected as part of the normal button programming process.

| Option              | Description                                                                                             |
|---------------------|---------------------------------------------------------------------------------------------------------|
| <b>Immediate</b>    | Provide audible alerting as per normal system operation.                                                |
| <b>Delayed Ring</b> | Only provide audible alerting after the system ring delay or, if set, the individual user's ring delay. |
| <b>No Ring</b>      | Do not provide any audible alerting.                                                                    |

There are two possible sources for the delay used when delayed ringing is selected for a button.

- **User > Telephony > Multi-line Options > Ring Delay:** Default = Blank (Use system setting), Range 1 to 98 seconds. This setting can be used to override the system setting. It allows a different ring delay to be set for each user.
- **System > Telephony > Telephony > Ring Delay:** Default = 5 seconds, Range 1 to 98 seconds. This is the setting used for all users unless a specific value is set for an individual user.

### Notes

- **Calls That Ignore Ring Delay** - Ring delay is not applied to hold recall calls, park recall calls, transfer return calls, voicemail ringback calls and automatic callback calls. For phones using

Internal Twinning, ring delay settings are not applied to calls alerting at a secondary twinned extension (except appearance buttons set to **No Ring** which are not twinned).

- **Auto Connect Calls** - Ring delay is applied to these calls before auto-connection. This does not apply to page calls.
- **Multiple Alerting Buttons** - Where a call is presented on more than one button on a user's phone, see Multiple Alerting Buttons, the shortest delay will be applied for all the alerting buttons. For example, if one of the alerting buttons is set to **Immediate**, that will override any alerting button set to **Delayed Ring**. Similarly if one of the alerting buttons is set to **No Ring**, it will be overridden if the other alerting button is set to **Immediate** or **Delayed Ring**.
- **Line Appearance Buttons** - Calls routed to a user that could potentially be presented on both a call appearance button and a line appearance button are only presented on the line appearance button. In this scenario, the ring delay settings used is that of the first free call appearance button.
- **Delay on Analog Lines** - Analog lines set to Loop Start ICLID already delay ringing whilst the system waits for the full ICLID in order to resolve incoming call routing. In this scenario the ring delay operates in parallel to the routing delay.
- **Ring Delay and Ringing Line Preference** - Appearance buttons can be set to **Delayed Ring** or **No Ring**. However, ringing line preference is still applied to alerting buttons even if set to **Delayed Ring** or **No Ring**.
- The user's **Delayed Ring Preference** setting is used to determine whether ringing line preference is used with or ignores buttons that are alerting but have **Delayed Ring** or **No Ring** set.

Ring Delay Example 1

In this example, the user has a line appearance button set but configured to no ring.

|                                                                                     |                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <b>Phone Idle</b> The phone is idle. The current selected button has been determined by Idle Line Preference as the first available call appearance button. This is shown by the _ underscore next to that button.                                                                                                                                                      |
|  | <b>Incoming Call Alerting on the Line</b> An incoming call arrives on the line and begin to alert somewhere on the system. The user's line appearance button shows this visually but doesn't ring audibly. Ringing line preference would makes the line appearance the user's currently selected button and therefore they would answer the line if they went off-hook. |

Delayed Ring Preference

When a call is alerting at an idle phone, by default Ringing Line Preference sets the call as the currently selected button and if the user then goes off-hook they will answer that call.

In most situations this is acceptable as the user hears ringing which informs them that there is a call waiting to be answered. If the user wants to make a call instead, they can press another call appearance button to go off-hook on that other button.

When ring delay is being used there can potentially be a problem if the user lifts the handset to make a call without looking at the display. If they do this while the a call is alerting silently on a button with ring delay, the user will actually answer the waiting call rather than get dial tone to make a call.

Once the call alerting on a button has currently selected call status, it retains that status even if a prior call on a button with ring delay applied comes out of its ring delay period.

### Delayed Ring Preference Example 1

In this example the user has a line appearance button for a line they monitor. This line appearance button has been set to no ring as the user occasionally need to use that line but does not normally answer calls on that line.

|                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    | <p><b>Phone Idle</b></p> <p>The phone is idle. The current selected button has been determined by Idle Line Preference as the first available call appearance button. This is shown by the _ underscore next to that button.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|   | <p><b>Incoming Call Alerting on the Line</b></p> <p>An incoming call arrives on the line and begin to alert somewhere on the system. The user's line appearance button shows this visually but doesn't ring audibly.</p> <p>Normally ringing line preference would make the line appearance the user's currently selected button and therefore they would answer the line if they went off-hook expecting to make a call.</p> <p>However, because <b>Delayed Ring Preference</b> is on for the user, ringing line preference is not applied and idle line preference makes their current selected button the first call appearance. If the user were to go off-hook they would be making a call on that call appearance.</p> |
|  | <p><b>Call Alerting for the User</b></p> <p>A call for the user arrives. It alerts on the first available call appearance button. Ringing line preference is applied and makes that the users currently selected button. If the user goes off-hook now that will answer the call on the call appearance and not the line appearance.</p>                                                                                                                                                                                                                                                                                                                                                                                     |

### Delayed Ring Preference Example 2

This is similar to the previous example except that the user and the line has been configured for a 15 second ring delay. This informs the users that the line has not been answered for some reason and allows them to answer it by just going off-hook.

|                                                                                     |                                                                                                                                                                                                                                  |
|-------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <p><b>Phone Idle</b></p> <p>The phone is idle. The current selected button has been determined by Idle Line Preference as the first available call appearance button. This is shown by the _ underscore next to that button.</p> |
|-------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

# Collapsing Appearances

This topic covers what happens when a user with several calls on different appearance buttons, creates a conference between those calls. In this scenario, the call indication will collapse to a single appearance button and other appearance buttons will return to idle. The exception is any line appearance buttons involved which will show 'in use elsewhere'.

## Collapsing Appearances Example 1

In this example, the user will setup a simple conference. **Ringing Line Preference** and **Idle Line Preference** are set for the user. **Auto Hold** for the system is on. **Answer Pre-Select** is off.

|                                                                                     |                                                                                                                                                                                                                         |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <p><b>Initial Call</b></p> <p>The user has a call in progress, shown on their first call appearance button. It is decided to conference another user into the call.</p>                                                 |
|  | <p><b>Make Conference Enquiry</b></p> <p>Pressing the <b>CONFERENCE</b> button on the users phone automatically places the current call on hold and takes the phone off hook on the next available call appearance.</p> |
|  | <p><b>Enquiry in Progress</b></p> <p>The other extension has answered and is invited to join a conference call. The user presses the <b>CONFERENCE</b> button on their phone again.</p>                                 |
|  | <p><b>Conference Starts/Call Appearances Collapse</b></p> <p>The conference call has started. The call appearances have collapsed to a single appearance.</p>                                                           |

# Joining Calls

Appearance buttons can be used to "join" existing calls and create a conference call. A user can join calls that are shown on their phone as 'in use elsewhere'.

This feature is often referred to as 'bridging into a call'. However this causes confusion with Bridged appearance buttons and so the term should be avoided.

The ability to join calls is controlled by the following feature which can be set for each user:

- **Cannot be Intruded:** Default = On

If this option is set on for the user who has been in the call the longest, no other user can join the call. If that user leaves the call, the status is taken from the next internal user who has been in the call the longest. The exceptions are:

- Voicemail calls are treated as **Cannot be Intruded** at all times.
- When an external call is routed off switch by a user who then leaves the call, the **Cannot be Intruded** status used is that of the user who forwarded the call off switch.
- Any call that does not involve an internal user at any stage is treated as **Cannot be Intruded** on. For example:
  - When an external call is routed off switch automatically using a short code in the incoming call route.
  - multi-site network calls from other systems that are routed off-switch.
  - VoIP calls from a device not registered on the system.
- The **Can Intrude** setting is not used for joining calls using appearance buttons.

The following also apply:

**Inaccessible** - In addition to the use of the **Cannot be Intruded** setting above, a call is inaccessible if:

- The call is still being dialed, ringing or routed.
- It is a ringback call, for example a call timing out from hold or park.
- If all the internal parties, if two or more, involved in the call have placed it on hold.
- **Conferencing Resources** - The ability to bridge depends on the available conferencing resource of the system. Those resources are limited and will vary with the number of existing parties in bridged calls and conferences. The possible amount of conferencing resource depends on the system type and whether Conferencing Center is also installed.

- **Conference Tone** - When a call is joined, all parties in the call hear the system conferencing tones. By default this is a single tone when a party joins the call and a double-tone when a party leaves the call. This is a system setting.
- **Holding a Bridged Call** - If a user puts a call they joined on hold, it is their connection to the joined call (conference) that is put on hold. The other parties within the call remain connected and can continue talking. This will be reflected by the button status indicators. The user who pressed hold will show 'on hold here' on the button they used to join the call. All other appearance users will still show 'in use here'.
- **Maximum Two Analog Trunks** - Only a maximum of two analog trunks can be included in a conference call.
- **Parked Calls** - A Line Appearance button may indicate that a call is in progress on that line. Such calls to be unparked using a line appearance.

### Joining Example 1: Joining with a Bridged Appearance

In this example, the user joins a call using a bridged appearance button. **Answer Pre-Select** is off.

|                                                                                     |                                                                                                                                                                     |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    | <b>User with Bridged Appearance Buttons</b> The user has bridged appearance buttons that match their colleagues call appearance buttons.                            |
|   | <b>Call on Bridged Appearance</b> The colleague has a call in progress on their first call appearance. This is matched on the first bridged appearance button.      |
|  | <b>User Joins the Call</b> Pressing the bridged appearance button will take our user off hook and join them into their colleagues call, creating a conference call. |

### Joining Example 2: Joining with a Line Appearance

In this example, the user joins a call by pressing a line appearance button. **Answer Pre-Select** is off.

|                                                                                     |                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <b>Line Goes Active</b> A call is active on the line with line ID number 601.<br><br>If this is an incoming call, it will show active but will not alert until its call routing has been determined. On ICLID analog lines, alerting is delayed until the ICLID that might be used to do that routing has been received. |
|  | <b>Line Appearance Alerting</b> The call routing is completed and the call is now ringing against its target. The line appearance also begins alerting and Ringing Line Preference has made it the current selected button.                                                                                              |

*Table continues...*

|                                                                                   |                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <p><b>Call Answered</b> Alerting on the line appearance has stopped but the line is still active. This indicates that the call has probably been answered. As our user's phone is idle, Idle Line Preference has returned the current select button to the first available call appearance button.</p> |
|  | <p><b>User Joins the Call</b> Our extension user has been asked by their colleague to join the call just answered on line 601. By pressing the line appearance button they have joined the call on that line and created a conference call.</p>                                                        |

## Multiple Alerting Appearance Buttons

In some scenarios, it may be potentially possible for the same call to alert on several appearance buttons. In this case the following apply:

- **Line appearance buttons override call and bridged appearance buttons**

In cases where a call on a line goes directly to the user as the incoming call route's destination, the call will only alert on the line appearance. In this scenario the ring delay settings used is that of the first free call appearance button.

- **A call can alert both call appearance, line appearance and bridged appearance buttons**

The most common example of this will be hunt group calls where the hunt group members also have bridged call appearances to each other. In this case the button used to answer the call will remain active whilst the other button will return to idle.

- **Calls on a line/bridged appearance buttons can also alert on call coverage button**

In this case alerting on the call coverage button may be delayed until the covered user's **Individual Coverage Time** has expired.

- **Ringling Line Preference Order**

When a call alerts on several of the user's appearance buttons and **Ringling Line Preference** is set for the user, the order used for current selected button assignment is:

1. Call appearance.
2. Bridged appearance.
3. Call coverage.
4. Line appearance.

### Example

A user has a call to a covered user alerting initially on a line appearance button. **Ringling Line Preference** will assign current selected button status to the line appearance. When the same

call also begins to alert on the call coverage appearance button, current selected button status switches to the call coverage appearance button.

### Ring Delay

Where ring delays are being used, the shortest delay will be applied for all the alerting buttons. For example, if one of the alerting buttons is set to **Immediate**, that will override any alerting button set to **Delayed Ring**. Similarly if one of the alerting buttons is set to **No Ring**, it will be overridden if the other alerting button is set to **Immediate** or **Delayed Ring**.

## Twinning

Twinning is a mechanism that allows an user to have their calls alert at two phones. The user's normal phone is referred to as the primary, the twinned phone as the secondary.

By default only calls alerting on the primary phone's call appearance buttons are twinned. For internal twinning, the system supports options to allow calls alerting on other types of appearance buttons to also alert at the secondary phone. These options are set through the **User | Twinning** section of the system configuration and are **Twin Bridge Appearances**, **Twin Coverage Appearances** and **Twin Line Appearances**. In all cases they are subject to the secondary having the ability to indicate additional alerting calls.

Call alerting at the secondary phone ignoring any Ring Delay settings of the appearance button being used at the primary phone. The only exception is buttons set to No Ring, in which case calls are not twinned.

## Busy on Held

For a user who has **Busy on Held** selected, when they have a call on hold, the system treats them as busy to any further calls. This feature is intended primarily for analog phone extension users. Within Manager, selecting **Busy on Held** for a user who also has call appearance keys will cause a prompt offering to remove the **Busy on Held** selection.

## Reserving a Call Appearance Button

Functions such as transferring calls using a **Transfer** key require the user to have at least one available call appearance button in order to complete the outgoing call part of the process. However, by default all call appearance button are available to receive incoming calls at all times. Through the system configuration it is possible to reserve the user's last call appearance button for making outgoing calls only.

1400, 1600, 9400, 9500, and 9600 Series telephone users can put a call on hold pending transfer if they already have held calls even if they have no free call appearance button available. See [Context Sensitive Transfer](#) on page 907.

### Reserving a Call Appearance

On the **User | Telephony | Multi-line Options** tab, select the option **Reserve Last CA**.

## Logging Off and Hot Desking

Users can be setup to log in and log out at different phones, this is called 'hot desking'. All the users settings, including their extension number, are transferred to the phone at which the user is logged in. This includes their key and lamp settings and appearance buttons.

This type of activity has the following effect on appearance buttons:

If logged out, or logged in at a phone that doesn't support appearance button functions:

- Bridged appearances set to the user will be inactive.
- Call coverage set to the user will still operate.

If logged in at a phone with fewer buttons than programmed for the user:

- Those buttons which are inaccessible on the logged in phone will be inactive.
- Any bridged appearances to those button from other users will be inactive.

### Remote Hot Desking

Release 4.0+ supports, through the addition of license keys, users hot desking between systems within a multi-site network. However, the use of appearance buttons (call coverage, bridged appearance and line appearance) within a multi-site network is not supported. Therefore when a user logs in to a remote system, any such button that they have will no longer operate. Similarly any button that other users have with the remote user as the target will not operate.

## Applications

A number of system applications can be used to make, answer and monitor calls. These applications treat calls handled using key and lamp operation follows:

### **SoftConsole**

This application can display multiple calls to or from a user and allow those calls to be handled through its graphical interface.

- All calls alerting on call appearance buttons are displayed.
- Calls on line, call coverage and bridged appearance buttons are not displayed until connected using the appropriate appearance button
- Connected and calls held here on all appearance button types are displayed.

# Chapter 111: Programming Appearance Buttons

## About this task

This section covers the programming of appearance buttons for users into existing system configurations.

**Appearance Functions** The functions **Call Appearance**, **Bridged Appearance**, **Coverage** and **Line Appearance** are collectively known as "appearance functions". For full details of their operation and usage refer to the Appearance Button Operation section. The following restrictions must be observed for the correct operation of phones.

Appearance functions programmed to buttons without suitable status lamps or icons are treated as disabled. These buttons are enabled when the user logs in on a phone with suitable buttons in those positions.

Line appearance buttons require line ID numbers to have been assigned, see Programming Line Appearance Numbers. The use of line appearances to lines where incoming calls are routed using DID (DDI) is not recommended.

**How many buttons are allowed?** The supported limits depend on the type of system. They are 10 for IP500 V2 systems, 20 for Server Edition and 40 for Server Edition Select. The limits are applied as follows:

- Number of bridged appearances to the same call appearance.
- Number of line appearances to the same line.
- Number of call coverage appearances of the same covered user.

## Programming Appearance Buttons Using Manager

If only button programming changes are required, the configuration changes can be merged back to the system without requiring a reboot.

## Procedure

1. Start Manager and load the current configuration from the system.
2. Locate and select the user for whom appearance buttons are required.
3. Select **Button Programming**.

## Programming Appearance Buttons

| Button No. | Label | Action     | Action Data |
|------------|-------|------------|-------------|
| 1          |       | Appearance | a=          |
| 2          |       | Appearance | b=          |
| 3          |       | Appearance | c=          |
| 4          |       |            |             |
| 5          |       |            |             |
| 6          |       |            |             |
| 7          |       |            |             |
| 8          |       |            |             |
| 9          |       |            |             |
| 10         |       |            |             |
| 11         |       |            |             |
| 12         |       |            |             |
| 13         |       |            |             |
| 14         |       |            |             |

The number of buttons displayed is based on the phone associated with the user when the configuration was loaded from the system. This can be overridden by selecting **Display all buttons**.

4. For the required button, click the button number and then click **Edit**.
5. Click the ... button.

Please select the required action:

Dial  
Group  
User  
Emulation ->  
Advanced ->  
**Appearance ->**

Appearance  
**Bridged Appearance**  
Coverage Appearance  
Line Appearance

Action: Bridged Appearance

Action Data: 203 Extn203 1 Immediate

OK Cancel Help

6. From the list of options that appears, click **Appearance**.
7. Select the type of appearance button required.
8. Use the **Action Data** drop-down fields to select the required settings.  
Click **OK**.
9. Repeat for any additional call appearance buttons required.  
Click **OK**.
10. Repeat for any other users requiring appearance buttons.

## Appearance Function System Settings

System settings are applied to all users and calls. The system settings that affect appearance operation are found on the System | Telephony tabs and are:

- Auto Hold
- Conferencing Tone
- Ring Delay
- Visually Differentiate External Call

[Programming Appearance Buttons](#) on page 1241

---

## Appearance Function User Settings

User settings are applied separately to each individual user. In addition to button programming, the following user settings are applicable to appearance button operation:

**Cannot be Intruded:** Default = On. This feature controls whether other users can use their appearance buttons to join the users call. It applies when the user is the longest present internal party already within the call.

- **Individual Coverage Time (secs):** Default = 10 seconds, Range 1 to 99999 seconds. 🛡️

This function sets how long the phone will ring at your extension before also alerting at any call coverage users. This time setting should not be equal to or greater than the **No Answer Time** applicable for the user.

- **Ring Delay:** Default = Blank (Use system setting). Range = 0 (use system setting) to 98 seconds.

This setting is used when any of the user's programmed appearance buttons is set to Delayed ringing. Calls received on that button will initially only alert visually. Audible alerting will only occur after the ring delay has expired.

- **Coverage Ring:** Default = Ring.

This field selects the type of ringing that should be used for calls alerting on any the user's call coverage and bridged appearance buttons. **Ring** selects normal ringing. **Abbreviated Ring** selects a single non-repeated ring. **No Ring** disables audible ringing. Note that each button's own ring settings (**Immediate**, **Delayed Ring** or **No Ring**) are still applied.

The ring used for a call alerting on a call coverage or bridged appearance button will vary according to whether the user is currently connected to a call or not.

- If not currently on a call, the **Coverage Ring** setting is used.
- If currently on a call, the quieter of the **Coverage Ring** and **Attention Ring** settings is used.

| Attention Ring Setting | Coverage Ring Setting |             |     |
|------------------------|-----------------------|-------------|-----|
|                        | Ring                  | Abbreviated | Off |
| <b>Ring</b>            | Ring                  | Abbreviated | Off |
| <b>Abbreviated</b>     | Abbreviated           | Abbreviated | Off |

- **Attention Ring:** Default = Abbreviated Ring.

This field selects the type of ringing that should be used for calls alerting on appearance buttons when the user already has a connected call on one of their appearance buttons.

**Ring** selects normal ringing. **Abbreviated Ring** selects a single ring. Note that each button's own ring settings (**Immediate**, **Delayed Ring** or **No Ring**) are still applied.

- **Ring Line Preference:** Default = On.

For users with multiple appearance buttons. When the user is free and has several calls alerting, ringing line preference assigns currently selected button status to the appearance button of the longest waiting call. Ringing line preference overrides idle line preference.

- **Idle Line Preference:** Default = On.

For users with multiple appearance buttons. When the user is free and has no alerting calls, idle line preference assigns the currently selected button status to the first available appearance button.

- **Delayed Ring Preference:** Default = Off.

This setting is used in conjunction with appearance buttons set to delayed or no ring. It sets whether ringing line preference should use or ignore the delayed ring settings applied to the user's appearance buttons.

When on, ringing line preference is only applied to alerting buttons on which the ring delay has expired.

When off, ringing line preference can be applied to an alerting button even if it has delayed ring applied.

- **Answer Pre-Select:** Default = Off.

Normally when a user has multiple alerting calls, only the details and functions for the call on currently selected button are shown. Pressing any of the alerting buttons will answer the call on that button, going off-hook will answer the currently selected button. Enabling **Answer Pre-Select** allows the user to press any alerting button to make it the current selected button and displaying its call details without answering that call until the user either presses that button again or goes off-hook. Note that when both **Answer Pre-Select** and **Ringing Line Preference** are enabled, once current selected status is assigned to a button through ringing line preference it is not automatically moved to any other button.

- **Reserve Last CA:** Default = Off.

Used for users with multiple call appearance buttons. When selected, this option stops the user's last call appearance button from being used to receive incoming calls. This ensures that the user always has a call appearance button available to make an outgoing call and to initiate actions such as transfers and conferences.

1400, 1600, 9400, 9500, 9600, and J100 Series telephone users can put a call on hold pending transfer if they already have held calls even if they have no free call appearance button available. See Context Sensitive Transfer.

**Abbreviated Ring:** This option has been replaced by the **Attention Ring** setting above.

## Programming Line Appearance ID Numbers

Line appearances are supported for analog, E1 PRI, T1, T1 PRI, and BRI PSTN trunks. They are not supported for E1R2, QSIG and IP trunks.

Note that setting and changing line settings including line appearance ID numbers requires the system to be rebooted.

## Automatic Renumbering

### About this task

#### Procedure

1. Select **Tools | Line Renumber**.
2. Select the starting number required for line numbering and click **OK**.
3. All lines that support **Line Appearance ID** will be numbered in sequence.

## Manual Renumbering

### About this task

#### Procedure

1. Start Manager and load the current configuration from the system.
2. Select  **Line**.
3. Select the line required.

The tab through which line appearance ID numbers are set will vary depending on the type of line. A couple of examples are shown below.

### a. Analog Line

On the **Line Settings** tab select **Line Appearance ID** and enter the ID required.

The screenshot shows the 'Line Settings' dialog box. The 'Line Appearance ID' field is highlighted with a red rectangle and contains the value '731'. Other fields include Line Number (5), Telephone Number, Incoming Group ID (0), Outgoing Group ID (0), Outgoing channels (1), Voice channels (1), Prefix, and National Prefix (0).

### b. Basic/Primary Rate Trunks

On the Channels tab select the individual channel and click Edit. Select **Line Appearance ID** and enter the required ID, then click **OK**. Repeat for all the channels required.

The screenshot shows the 'Channels' dialog box. It contains a table with columns 'Channel', 'Groups', and 'Line Appearance'. The 'Line Appearance' column is highlighted. Below the table is the 'Edit Channel' section, where the 'Line Appearance Id' field is highlighted with a red rectangle and contains the value '702'. Other fields in the 'Edit Channel' section include Channels (02), Incoming Group (0), and Outgoing Group (0). Buttons for 'Edit...', 'OK', and 'Cancel' are also visible.

| Channel | Groups | Line Appearance |
|---------|--------|-----------------|
| 1       | 0 0    | 701             |
| 2       | 0 0    | 702             |
| 3       | 0 0    | 703             |
| 4       | 0 0    | 704             |
| 5       | 0 0    | 705             |
| 6       | 0 0    | 706             |
| 7       | 0 0    | 707             |
| 8       | 0 0    | 708             |
| 9       | 0 0    | 709             |
| 10      | 0 0    | 710             |

4. Click **OK** and repeat for any other lines.

## Outgoing Line Programming

Assigning line ID numbers to lines and associating line appearance buttons to those lines is sufficient for answering incoming calls on those lines. However, to use line appearance buttons for outgoing calls may require further programming.

**Short Codes and Outgoing Line Appearance Calls** Once a line has been seized using a line appearance button, short code matching is still applied to the number dialed. That can include user, system and ARS short codes.

The short codes matching must resolve to an off-switch number suitable to be passed direct to the line.

The final short code applied must specify a 'dial' feature. This allows call barring of specific matching numbers to be applied using short codes set to features such as 'Busy'.

# Part 16: SMDR Call Records

# Chapter 112: Appendix: SMDR Call Records

The control unit is able to send SMDR (Station Message Detail Reporting) records to a specified IP address and port. Various third-party call billing applications are able to process those records to produce call reports.

- An SMDR record is output for each call between two parties.
- The SMDR record is output when the call between the parties ends.
- In some scenarios, for example transferred calls, multiple SMDR records are output for each part of the call. That is, each part of the call where one of the parties involved changes. The different parts of the call are referred to as 'call legs' or 'call segments'.
- Each SMDR call record is output in a CSV format with a comma between each field.

## Related links

[SMDR Record Buffering](#) on page 1250

[Checking SMDR Generation](#) on page 1250

[SMDR Record Output](#) on page 1250

[SMDR Record Format](#) on page 1251

[Call Times in SMDR](#) on page 1251

[SMDR Fields](#) on page 1252

---

## Enabling SMDR

SMDR output is enabled as follows:

1. Access the system configuration using your preferred manager application.
2. Select **System** settings and then select the **SMDR** tab.
3. Use the **Output** drop down box to select **SMDR only** and enter the required **IP Address** and **TCP Port**.
4. Adjust any other SMDR output settings if required.
5. For systems in a network of IP Offices, repeat this for all systems.

## Related links

[Appendix: SMDR Call Records](#) on page 1249

---

## SMDR Record Buffering

The system generates a record at the end of a call or each call leg. It attempts to send the record at the time it is generated. However, if not possible, it buffers records up to the limit set for the system. By default that is 500 records.

- Whilst buffering, it still attempts to send a record when that new record is generated. If successful, it will also send any buffered records.
- If the buffer limit is reached, the system deletes the oldest record each time a new record is added. The buffer is maintained through system restarts.

## Related links

[Appendix: SMDR Call Records](#) on page 1249

---

## Checking SMDR Generation

Having enabled SMDR output, the generation of records can be view by enabling the **Call** trace option **Call Logging** in System Monitor. Note that this causes any records displayed to be removed from the buffer.

## Related links

[Appendix: SMDR Call Records](#) on page 1249

---

## SMDR Record Output

An SMDR record is generated at the end of each call between two devices on the system. Devices include extensions, trunk lines (or channels on a trunk), voicemail channels, conference channels and system tones.

- SMDR records are only produced for calls which are presented to another device or a barred short code. For example, an internal user dialing a short code that simply changes a setting does not produce a SMDR record.
- SMDR records are generated when each call or call leg ends. Therefore the output order of the SMDR records does not match the call start times.
- Each record contains a **Call ID** :
  - The **Call ID** starts from 1,000,000 and is reset back to that value following each system restart.

- The **Call ID** is increased by 1 for each subsequent new call.
- When a call moves from one device to another, separate SMDR records are output each part of the call. Each of these records has the same **Call ID**.
- Each record indicates in its **Continuation** field whether there are further records for the same call.

#### Related links

[Appendix: SMDR Call Records](#) on page 1249

---

## SMDR Record Format

The format used for the SMDR record output is:

- Each SMDR record contains call information in a comma-separated format (CSV), that is a byte stream of variable width fields delimited by commas (0x2C).
- Each record is terminated by carriage-return (0x0D), newline (0x0A) sequence. There is no quoting or escaping currently defined as fields do not include ',' or 'newline' characters.

#### Related links

[Appendix: SMDR Call Records](#) on page 1249

---

## Call Times in SMDR

Each SMDR record can include values for ringing time, connected time, held time and parked time. The total duration of an SMDR record is the sum of those values.

- The time when a call is not in one of the states above, is not included in the SMDR record.
- All times are rounded up to the nearest second.
- Where announcements are being used, the connected time for a call begins either when the call is answered or the first announcement begins.
- Each SMDR record has a **Call Start Time** taken from the system time. For calls being transferred or subject to call splitting, each of the multiple SMDR records for the call has the same **Call Start** time as the original call.
- The **UTC Time** shown at the end of the record is the time at which the SMDR record was generated.

#### Related links

[Appendix: SMDR Call Records](#) on page 1249

## SMDR Fields

The format used for the SMDR record output is:

- Each SMDR record contains call information in a comma-separated format (CSV), that is a byte stream of variable width fields delimited by commas (0x2C).
- Each record is terminated by carriage-return (0x0D), newline (0x0A) sequence. There is no quoting or escaping currently defined as fields do not include ',' or 'newline' characters.

Each SMDR record can contain the following fields.

- Note that time values are rounded up to the nearest second.
- Empty fields are shown if the field is not applicable to the call.

| No. | Field                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.  | <b>Call Start Time</b> | <p>The call start time in the format YYYY/MM/DD HH:MM:SS. This is based on the system time including any DST offset.</p> <ul style="list-style-type: none"> <li>• All records relating to the same call, that is having the same <b>Call ID</b>, have the same <b>Call Start Time</b>.</li> <li>• If the system has <b>Call Splitting for Diverts</b> enabled, the <b>Call Start Time</b> is changed to the time the forward occurred for all records following that stage of the call. However, the records for the externally forwarded call retain the original <b>Call ID</b>.</li> </ul> |
| 2.  | <b>Connected Time</b>  | <p>Duration of the connected part of the call in HH:MM:SS format. This does not include ringing, held and parked time. A lost or failed call will have a duration of 00:00:00. The total duration of a record is calculated as <b>Connected Time</b> + <b>Ring Time</b> + <b>Hold Time</b> + <b>Park Time</b>.</p>                                                                                                                                                                                                                                                                            |
| 3.  | <b>Ring Time</b>       | <p>Duration of the ring part of the call in seconds.</p> <ul style="list-style-type: none"> <li>• For inbound calls, this represents the interval between the call arriving at the switch and it being answered. It does not match the time a call rang at an individual extension.</li> <li>• For outbound calls, this indicates the interval between the call being initiated and being answered at the remote end if supported by the trunk type. Analog trunks are not able to detect remote answer and therefore cannot provide a ring duration for outbound calls.</li> </ul>           |
| 4.  | <b>Caller</b>          | <p>The caller's number. If the call originated at an extension, this is the extension number. If the call originated externally, this is the CLI of the caller if available, otherwise blank. For SIP trunks, the field can contain the number plus IP address. For example, 12345@192.0.2.123.</p>                                                                                                                                                                                                                                                                                           |
| 5.  | <b>Direction</b>       | <p>The direction of the call ; <b>I</b> for inbound, <b>O</b> for outbound. This value can be used in conjunction with the <b>Is Internal</b> value below to determine the call type.</p>                                                                                                                                                                                                                                                                                                                                                                                                     |

*Table continues...*

| No.       | Field                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |           |             |           |   |   |                         |   |   |                |   |   |                         |
|-----------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|-------------|-----------|---|---|-------------------------|---|---|----------------|---|---|-------------------------|
| 6.        | <b>Called Number</b> | <p>This is the number called by the system. For a call that is transferred, this field shows the original called number, not the number of the party who transferred the call.</p> <ul style="list-style-type: none"> <li>• <b>Internal calls</b> – The extension, group or short code called</li> <li>• <b>Inbound calls</b> – The target extension number for the call</li> <li>• <b>Outbound calls</b> – The dialed digits</li> <li>• <b>Voice Mail</b> – Calls to a user's own voicemail mailbox</li> </ul>                                                                            |           |             |           |   |   |                         |   |   |                |   |   |                         |
| 7.        | <b>Dialed Number</b> | For internal calls and outbound calls, this is identical to the <b>Called Number</b> above. For inbound calls, this is the DDI of the incoming caller.                                                                                                                                                                                                                                                                                                                                                                                                                                     |           |             |           |   |   |                         |   |   |                |   |   |                         |
| 8.        | <b>Account Code</b>  | The last account code attached to the call.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |           |             |           |   |   |                         |   |   |                |   |   |                         |
| 9.        | <b>Is Internal</b>   | <p>This field indicates whether both parties on the call are internal (<b>1</b>) or not (<b>0</b>). Note that calls to destinations on other switches in a network are treated as internal. This value can be used in conjunction with the <b>Direction</b> value above to determine the call type as follows:</p> <table> <tr> <th>Direction</th><th>Is Internal</th><th>Call Type</th></tr> <tr> <td>I</td><td>0</td><td>Incoming external call.</td></tr> <tr> <td>O</td><td>1</td><td>Internal call.</td></tr> <tr> <td>O</td><td>0</td><td>Outgoing external call.</td></tr> </table> | Direction | Is Internal | Call Type | I | 0 | Incoming external call. | O | 1 | Internal call. | O | 0 | Outgoing external call. |
| Direction | Is Internal          | Call Type                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |           |             |           |   |   |                         |   |   |                |   |   |                         |
| I         | 0                    | Incoming external call.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |           |             |           |   |   |                         |   |   |                |   |   |                         |
| O         | 1                    | Internal call.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |           |             |           |   |   |                         |   |   |                |   |   |                         |
| O         | 0                    | Outgoing external call.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |           |             |           |   |   |                         |   |   |                |   |   |                         |
| 10.       | <b>Call ID</b>       | This is a numerical identifier, which is incremented for each unique call. If the call has generates several SMDR records, each record has the same <b>Call ID</b> . Note that the Call ID is restarted from 1,000,000 following any system restart.                                                                                                                                                                                                                                                                                                                                       |           |             |           |   |   |                         |   |   |                |   |   |                         |
| 11.       | <b>Continuation</b>  | This value indicates if the call has any further records with the same <b>Call ID</b> . It is <b>1</b> if there is a further record, otherwise <b>0</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                  |           |             |           |   |   |                         |   |   |                |   |   |                         |
| 12.       | <b>Party1 Device</b> | The device 1 number. This is usually the call initiator though in some scenarios, such as conferences, this may vary. If an extension/hunt group is involved in the call, its details have priority over any trunk. That includes remote network destinations.                                                                                                                                                                                                                                                                                                                             |           |             |           |   |   |                         |   |   |                |   |   |                         |

| Type                   | Party Device                                     | Party Name                                               |

| No. | Field                             | Description                                                                                                                                                                                                                                |
|-----|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 13. | <b>Party1 Name</b>                | The name of the device. For an extension or agent, this is the user name encoded in UTF-8.                                                                                                                                                 |
| 14. | <b>Party2 Device</b>              | The other party for the call segment. Encoded as per <b>Party1 Device</b> above. For barred calls, this field shows <b>Barred</b> .                                                                                                        |
| 15. | <b>Party2 Name</b>                | The other parties name. See <b>Party1 Name</b> above. For barred calls, this field shows <b>Barred</b> .                                                                                                                                   |
| 16. | <b>Hold Time</b>                  | The number of seconds the call has been held during this call segment.                                                                                                                                                                     |
| 17. | <b>Park Time</b>                  | The number of seconds the call has been parked during this call segment.                                                                                                                                                                   |
| 18. | <b>Authorization Valid</b>        | This field is used for authorization codes. This field shows <b>1</b> for valid authorization or <b>0</b> for invalid authorization. This is Blank, no code is used.                                                                       |
| 19. | <b>Authorization Code</b>         | For security, this field shows <b>n/a</b> regardless of the authorization code used. This is blank, no code is used.                                                                                                                       |
| 20. | <b>User Charged</b>               | This and fields 21 to 27 are used for ISDN Advice of Charge (AoC). If blank, AoC is not being used. This field indicates the user to which the call charge has been assigned. This is not necessarily the user involved in the call.       |
| 21. | <b>Call Charge</b>                | The total call charge calculated using the line cost per unit and user markup.                                                                                                                                                             |
| 22. | <b>Currency</b>                   | The currency. This is a system wide setting set in the system configuration.                                                                                                                                                               |
| 23. | <b>Amount at Last User Change</b> | The current AoC amount at user change.                                                                                                                                                                                                     |
| 24. | <b>Call Units</b>                 | The total call units.                                                                                                                                                                                                                      |
| 25. | <b>Units at Last User Change</b>  | The current AoC units at user change.                                                                                                                                                                                                      |
| 26. | <b>Cost per Unit</b>              | This value is set in the system configuration against each line on which AoC signalling is set. The values are 1/10,000th of a currency unit. For example, if the call cost per unit is £1.07, a value of 10700 should be set on the line. |
| 27. | <b>Mark Up</b>                    | Indicates the mark up value set in the system configuration for the user to which the call is being charged. The field is in units of 1/100th, for example an entry of 100 is a markup factor of 1 .                                       |
| 28. | <b>External Targeting Cause</b>   | This field indicates who or what caused the external call and a reason code. For example <b>U FU</b> indicates that the external call was caused by the Forward Unconditional settings of a User.                                          |

|                    |                                                | <b>Xfd</b> Transferred call.                                                                                                                                                                                                                                                                                                     |
| <b>29.</b>         | <b>External Targeter ID</b>                    | The associated name of the targeter indicated in the <b>External Targeting Cause</b> field. <ul style="list-style-type: none"> <li>For hunt groups and users, this is their name in the system configuration.</li> <li>For an incoming call route, this is the route's <b>Tag</b> value if set, otherwise <b>ICR</b>.</li> </ul> |
| <b>30.</b>         | <b>External Targeted Number</b>                | This field is used for forwarded, Incoming Call Route targeted and mobile twin calls to an external line. It shows the external number called by the system as a result of the off-switch targeting whereas other called fields give the original number dialed.                                                                 |
| <b>31.</b>         | <b>Calling Party Server IP Address</b>         | This IP address identifies the server where the calling extension is logged in.                                                                                                                                                                                                                                                  |
| <b>32.</b>         | <b>Unique Call ID for the Caller Extension</b> | Numerical value that is a unique identifier of the call on the server where the call was initiated.                                                                                                                                                                                                                              |
| <b>33.</b>         | <b>Called Party Server IP Address</b>          | This IP address identifies the server where the called extension is logged in. If the field does not contain an IP address, then the call is to a trunk outside the IP Office network.                                                                                                                                           |
| <b>34.</b>         | <b>Unique Call ID for the Called Extension</b> | Numerical value that is a unique identifier of the call on the server where the called extension is logged in.                                                                                                                                                                                                                   |
| <b>35.</b>         | <b>SMDR Record Time</b>                        | The system date and time, not including any DST offset, at which the SMDR record was generated. It uses the format YYYY/MM/DD HH:MM:SS.                                                                                                                                                                                          |
| <b>36.</b>         | <b>Caller Consent Directive</b>                | This field is used for calls going through an auto-attendant service that is configured to ask for caller consent to some choice. <ul style="list-style-type: none"> <li>0 = Consent Not Requested</li> <li>2 = Consent Given</li> <li>6 = Consent Denied</li> </ul>                                                             |

Table continues...

| No. | Field                              | Description                                                                                                                                                                                                                                                                                                                                                                    |
|-----|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 37. | <b>Calling Number Verification</b> | Show the authentication level provided by the ISP on SIP lines configured to use calling number verification. Shows A, B, C or N/A is not authentication level information provided. A record is still shown for calls which the system rejects due to failed authentication. For more details, see <a href="#">SIP Calling Number Verification (STIR/SHAKEN)</a> on page 963. |

# Chapter 113: SMDR Examples

The following are examples of system SMDR records for common call scenarios.

In the following examples, the underlined fields indicate key values in the interpretation of the scenario. ... is used to indicate that further fields have been omitted for clarity as they are not relevant to the example.

## SMDR Example: Lost Incoming Call

In this record, the **Connected Time** is zero and the **Continuation** field is 0, indicating that the call was never connected. The **Ring Time** shows that it rang for 9 seconds before ending.

```
2014/06/28 09:28:41,00:00:00,9,8004206,I,4324,4324,,0,1000014155,0,E4324,Joe

## SMDR Example: Transfer

In this example, 2126 has called 2102. The 1st record has the **Continuation** set a 1, indicating that it the call has further records. The 3rd record has the same **Call ID** but the **Party 2 Device** and **Party 2 Name** fields have changed, indicating that the call is now connected to a different device. We can infer the blind transfer from the 2nd record which shows a call of zero **Connected Time** between the original call destination 2102 and the final destination 2121.

```
2014/07/09
17:51,00:00:38,18,2126,0,2102,2102,,1,1000019,1,E2126,Extn2126,E2102,Extn2102,19,0,...
```

```
2014/07/09
17:52,00:00:00,7,2102,0,2121,2121,,1,1000020,0,E2102,Extn2102,E2121,Extn2121,0,0,...
```

```
2014/07/09

```

In this second example, extension 402 answers an external call and then transfers it to extension 403. Again the two legs of the external call have the same time/date stamp and same call ID.

```

## SMDR Example: Call Transferred to Voicemail

In this example, the **Continuation** field being 1 in the first record tells us that it was not the end of the call. The matching **Call ID** identifies the second record as part of the same call. The change in **Party 1** details between the two records show that the call was transferred to voicemail.

```

## SMDR Example: Conference Using Conference Add Short Code

In this example, a user conferences 2 calls. This creates 5 SMDR records; 2 initial 2-party calls and then 3 calls connected to a system's conference.

First 2101 has made a call and put it on hold (record 2), then made another call and put it on hold (record 1) and then dialed the default short code \*47 to conference their held calls (record 3). The records for the first two calls have the **Continuation** field set as 1 indicating that the calls continued in further records.

Record 3 shows 2101 making a new call in which they dial \*47, which places them and their held calls into a conference. This is shown by the **Party 2 Device** and **Party 2 Name** details as being a conference (100) and the conference channel used for each.

```

## SMDR Example: Internal Twinning

The records for scenarios such as internal call forwarding or follow me indicate the rerouting in a single record by having **Caller** and **Called Number** details that differ from the final **Party 1** and **Party 2** details. Internal twinning differs is showing a call answered at the twin exactly the same as having been answered at the primary.

203 is internally twinned to 201. Call from 207 to 203 but answer at 201.

```

## SMDR Example: Park and Unpark

Parking and unparking of a call at the same extension is simply shown by the **Park Time** field of the SMDR record. Similarly, calls held and unheld at the same extension are shown by the **Held Time** field of the SMDR record for the call. The records below however, show a call parked at one extension and then unparked at another.

The records show a call from 207 to 203. 203 then parks the call shown by the **Park Time**. The call is unparked by 201, hence the first record is indicated as continued in its **Continuation** field. The matching **Call ID** indicates the subsequent record for the call.

## SMDR Example: Call Transferred Manually

In this example the internal user transfers a call to an external number. The **External Targeting Cause** in the first record indicates that this external call is the result of a user (U) transfer proposal (XfP) call. The **Continuation** field indicates that another record with the same **Call ID** will be output.

The additional records are output after the transferred call is completed. The first relates to the initial call prior. The second is the transferred call with the **External Targeting Cause** now indicating user (U) transferred (Xfd).

```
2014/08/01 16:33:19,00:00:05,3,203,O,9416,9416,,0,1000044,1,E203,Extn203,T9005,Line

## SMDR Example: Internal Network Call

The SMDR records include fields (31 to 34) that identifying the calling and called IP Office systems. These are useful for calls between systems in an IP Office network. This still requires each system in the network to be configured to output its own SMDR records..

In this example, 806 on the 1st IP Office system (192.168.0.182) makes an internal call to 706 on the 2nd IP Office system (192.168.0.180). Both systems output their own SMDR record for the same call.

### Record from 1st IP Office system with the calling extension 806

```
2020/03/06
10:33:27,00:00:15,8,806,I,706,706,,1,1000018,0,E806,Extn806,E706,Extn706,7,0,,,,,,,,,
,,192.168.0.182,1049,192.168.0.180,1087,
2020/03/06 10:33:56,0
```

**Record from 2nd IP Office system with the called extension 706**

```

2020/03/06

## SMDR Example: Caller Consent Request

The actions in Embedded Voicemail auto-attendants and Voicemail Pro call flows can be assigned a consent setting value. By selecting the particular action the caller can indicate their consent. That value is indicated in the SMDR record for the call.

**Consent Not Requested**

In this example, the call action used to route the call does not have a consent setting. Therefore, the consent setting within the SMDR record remains 0.

```

2020/03/06 10:35:42,00:00:02,0,201,O,*99,*99,,1,1000000,1,E201,Extn201,V9511,VM Channel
11,0,0,,,,,,,,,192.168.0.1,1002,192.168.0.1,1004,
2020/03/06 10:35:45,0
2020/03/06
10:35:42,00:00:02,2,201,O,*99,*99,,1,1000000,0,E201,Extn201,E202,Extn202,0,0,,,,,,,,,
,,192.168.0.1,1002,192.168.0.1,1005,
2020/03/06 10:35:49,0

```

**Consent Denied**

In this example, the call action used to route the call is set to indicate consent denied. Therefore, the consent setting in the SMDR record is changed to 6.

```

2020/03/06 10:35:54,00:00:02,0,201,O,*99,*99,,1,1000001,1,E201,Extn201,V9511,VM Channel

## Finding an Avaya Business Partner

If your IP Office system currently does not have an Avaya business partner providing support and maintenance for it, you can use the Avaya Partner Locator tool to find a business partner.

#### Procedure

1. Using a browser, go to the [Avaya Website](#) at <https://www.avaya.com>
2. Select **Partners** and then **Find a Partner**.
3. Enter your location information.
4. For IP Office business partners, using the **Filter**, select **Small/Medium Business**.

## Additional IP Office resources

In addition to the documentation website (see [Additional Manuals and User Guides](#) on page 1271), there are a range of website that provide information about Avaya products and services including IP Office.

- [Avaya Website](#) (<https://www.avaya.com>)

This is the official Avaya website. The front page also provides access to individual Avaya websites for different regions and countries.

- [Avaya Sales & Partner Portal](#) (<https://sales.avaya.com>)

This is the official website for all Avaya business partners. The site requires registration for a username and password. Once accessed, you can customize the portal to show specific products and information type that you want to see.

- [Avaya Support](#) (<https://support.avaya.com>)

This site provide access to Avaya product software, documentation and other services for Avaya product installers and maintainers.

- [Avaya Support Forums](#) (<https://support.avaya.com/forums/index.php>)

This site provides forums for discussing product issues.

- **Avaya Learning** (<https://www.avaya-learning.com/>)

This site provides access to training courses and accreditation programs for Avaya products.
