

# **Administering Avaya IP Office with Web Manager**

Release 12.3  
Issue 58  
April 2026

# Notices

© 2026 Avaya LLC. All Rights Reserved.

You may, at your own risk, assemble a MyDocs collection solely for your own internal business purposes, which constitutes a modification to the original published version of the publications. Avaya shall not be responsible for any modifications, additions, or deletions to the original published version of publications. You agree to defend, indemnify and hold harmless Avaya, Avaya's agents, servants and employees against all claims, lawsuits, demands and judgments arising out of, or in connection with, your modifications, additions or deletions to the publications.

A single topic or a collection of topics may come from multiple Avaya publications. All of the content in your collection is subject to the legal notices and disclaimers in the publications from which you assembled the collection. For information on licenses and license types, trademarks, and regulatory statements, see the original publications from which you copied the topics in your collection.

Except where expressly stated by Avaya otherwise, no use should be made of materials provided by Avaya on this site. All content on this site and the publications provided by Avaya including the selection, arrangement and design of the content is owned by Avaya and/or its licensors and is protected by copyright and other intellectual property laws including the sui generis rights relating to the protection of databases. Avaya owns all right, title and interest to any modifications, additions or deletions to the content in the Avaya publications.

## Notice

While reasonable efforts have been made to ensure that the information in this document is complete and accurate at the time of printing, Avaya assumes no liability for any errors. Avaya reserves the right to make changes and corrections to the information in this document without the obligation to notify any person or organization of such changes.

## Documentation disclaimer

"Documentation" means information published in varying media which may include product information, subscription or service descriptions, operating instructions and performance specifications that are generally made available to users of products. Documentation does not include marketing materials. Avaya shall not be responsible for any modifications, additions, or deletions to the original published version of Documentation unless such modifications, additions, or deletions were performed by or on the express behalf of Avaya. End user agrees to indemnify and hold harmless Avaya, Avaya's agents, servants and employees against all claims, lawsuits, demands and judgments arising out of, or in connection with, subsequent modifications, additions or deletions to this documentation, to the extent made by End user.

## Link disclaimer

Avaya is not responsible for the contents or reliability of any linked websites referenced within this site or Documentation provided by Avaya. Avaya is not responsible for the accuracy of any information, statement or content provided on these sites and does not necessarily endorse the products, services, or information described or offered within them. Avaya does not guarantee that these links will work all the time and has no control over the availability of the linked pages.

## Warranty

Avaya provides a limited warranty on Avaya hardware and software. Please refer to your agreement with Avaya to establish the terms of the limited warranty. In addition, Avaya's standard warranty language as well as information regarding support for this product while under warranty is available to Avaya customers and other parties through the Avaya Support website: <https://support.avaya.com/helpcenter/getGenericDetails?detailId=C20091120112456651010> under the link "Warranty & Product Lifecycle" or such successor site as designated by Avaya. Please note that if the product(s) was purchased from an authorized Avaya channel partner outside of the United States and Canada, the warranty is provided by said Avaya Channel Partner and not by Avaya.

"Hosted Service" means an Avaya hosted service subscription that You acquire from either Avaya or an authorized Avaya Channel Partner (as applicable) and which is described further in Hosted SAS or other service description documentation regarding the applicable hosted service. If You purchase a Hosted Service subscription, the foregoing limited warranty may not apply but You may be entitled to support services in connection with the Hosted Service as described further in your service description documents for the applicable Hosted Service. Contact Avaya or Avaya Channel Partner (as applicable) for more information.

## Hosted Service

THE FOLLOWING APPLIES ONLY IF YOU PURCHASE AN AVAYA HOSTED SERVICE SUBSCRIPTION FROM AVAYA OR AN AVAYA CHANNEL PARTNER (AS APPLICABLE). THE TERMS OF USE FOR HOSTED SERVICES ARE AVAILABLE ON THE AVAYA WEBSITE, [HTTPS://SUPPORT.AVAYA.COM/LICENSEINFO](https://support.avaya.com/licenseinfo) UNDER THE LINK "Avaya Terms of Use for Hosted Services" OR SUCH SUCCESSOR SITE AS DESIGNATED BY AVAYA, AND ARE APPLICABLE TO ANYONE WHO ACCESSES OR USES THE HOSTED SERVICE. BY ACCESSING OR USING THE HOSTED SERVICE, OR AUTHORIZING OTHERS TO DO SO, YOU, ON BEHALF OF YOURSELF AND THE ENTITY FOR WHOM YOU ARE DOING SO (HEREINAFTER REFERRED TO INTERCHANGEABLY AS "YOU" AND "END USER"), AGREE TO THE TERMS OF USE. IF YOU ARE ACCEPTING THE TERMS OF USE ON BEHALF A COMPANY OR OTHER LEGAL ENTITY, YOU REPRESENT THAT YOU HAVE THE AUTHORITY TO BIND SUCH ENTITY TO THESE

TERMS OF USE. IF YOU DO NOT HAVE SUCH AUTHORITY, OR IF YOU DO NOT WISH TO ACCEPT THESE TERMS OF USE, YOU MUST NOT ACCESS OR USE THE HOSTED SERVICE OR AUTHORIZE ANYONE TO ACCESS OR USE THE HOSTED SERVICE.

## Licenses

The Global Software License Terms ("Software License Terms") are available on the following website <https://www.avaya.com/en/legal-license-terms/> or any successor site as designated by Avaya. These Software License Terms are applicable to anyone who installs, downloads, and/or uses Software and/or Documentation. By installing, downloading or using the Software, or authorizing others to do so, the end user agrees that the Software License Terms create a binding contract between them and Avaya. In case the end user is accepting these Software License Terms on behalf of a company or other legal entity, the end user represents that it has the authority to bind such entity to these Software License Terms.

## Copyright

Except where expressly stated otherwise, no use should be made of materials on this site, the Documentation, Software, Hosted Service, or hardware provided by Avaya. All content on this site, the documentation, Hosted Service, and the product provided by Avaya including the selection, arrangement and design of the content is owned either by Avaya or its licensors and is protected by copyright and other intellectual property laws including the sui generis rights relating to the protection of databases. You may not modify, copy, reproduce, republish, upload, post, transmit or distribute in any way any content, in whole or in part, including any code and software unless expressly authorized by Avaya. Unauthorized reproduction, transmission, dissemination, storage, or use without the express written consent of Avaya can be a criminal, as well as a civil offense under the applicable law.

## Virtualization

The following applies if the product is deployed on a virtual machine. Each product has its own ordering code and license types. Unless otherwise stated, each Instance of a product must be separately licensed and ordered. For example, if the end user customer or Avaya Channel Partner would like to install two Instances of the same type of products, then two products of that type must be ordered.

## Third Party Components

The following applies only if the H.264 (AVC) codec is distributed with the product. THIS PRODUCT IS LICENSED UNDER THE AVC PATENT PORTFOLIO LICENSE FOR THE PERSONAL USE OF A CONSUMER OR OTHER USES IN WHICH IT DOES NOT RECEIVE REMUNERATION TO (i) ENCODE VIDEO IN COMPLIANCE WITH THE AVC STANDARD ("AVC VIDEO") AND/OR (ii) DECODE AVC VIDEO THAT WAS ENCODED BY A CONSUMER ENGAGED IN A PERSONAL ACTIVITY AND/OR WAS OBTAINED FROM A VIDEO PROVIDER LICENSED TO PROVIDE AVC VIDEO. NO LICENSE IS GRANTED OR SHALL BE IMPLIED FOR ANY OTHER USE. ADDITIONAL INFORMATION MAY BE OBTAINED FROM MPEG LA, L.L.C. SEE [HTTP://WWW.MPEGLA.COM](http://www.mpegla.com).

## Service Provider

WITH RESPECT TO CODECS, IF THE AVAYA CHANNEL PARTNER IS HOSTING ANY PRODUCTS THAT USE OR EMBED THE H.264 CODEC OR H.265 CODEC, THE AVAYA CHANNEL PARTNER ACKNOWLEDGES AND AGREES THE AVAYA CHANNEL PARTNER IS RESPONSIBLE FOR ANY AND ALL RELATED FEES AND/OR ROYALTIES. THE H.264 (AVC) CODEC IS LICENSED UNDER THE AVC PATENT PORTFOLIO LICENSE FOR THE PERSONAL USE OF A CONSUMER OR OTHER USES IN WHICH IT DOES NOT RECEIVE REMUNERATION TO: (i) ENCODE VIDEO IN COMPLIANCE WITH THE AVC STANDARD ("AVC VIDEO") AND/OR (ii) DECODE AVC VIDEO THAT WAS ENCODED BY A CONSUMER ENGAGED IN A PERSONAL ACTIVITY AND/OR WAS OBTAINED FROM A VIDEO PROVIDER LICENSED TO PROVIDE AVC VIDEO. NO LICENSE IS GRANTED OR SHALL BE IMPLIED FOR ANY OTHER USE. ADDITIONAL INFORMATION FOR H.264 (AVC) AND H.265 (HEVC) CODECS MAY BE OBTAINED FROM MPEG LA, L.L.C. SEE [HTTP://WWW.MPEGLA.COM](http://www.mpegla.com).

## **Compliance with Laws**

You acknowledge and agree that it is Your responsibility to comply with any applicable laws and regulations, including, but not limited to laws and regulations related to call recording, data privacy, intellectual property, trade secret, fraud, and music performance rights, in the country or territory where the Avaya product is used.

## **Preventing Toll Fraud**

"Toll Fraud" is the unauthorized use of your telecommunications system by an unauthorized party (for example, a person who is not a corporate employee, agent, subcontractor, or is not working on your company's behalf). Be aware that there can be a risk of Toll Fraud associated with your system and that, if Toll Fraud occurs, it can result in substantial additional charges for your telecommunications services.

## **Avaya Toll Fraud intervention**

If You suspect that You are being victimized by Toll Fraud and You need technical assistance or support, please contact your Avaya Sales Representative.

## **Security Vulnerabilities**

Information about Avaya's security support policies can be found in the Security Policies and Support section of <https://support.avaya.com/security>.

Suspected Avaya product security vulnerabilities are handled per the Avaya Product Security Support Flow (<https://support.avaya.com/css/P8/documents/100161515>).

## **Trademarks**

The trademarks, logos and service marks ("Marks") displayed in this site, the Documentation, Hosted Service(s), and product(s) provided by Avaya are the registered or unregistered Marks of Avaya, its affiliates, its licensors, its suppliers, or other third parties. Users are not permitted to use such Marks without prior written consent from Avaya or such third party which may own the Mark. Nothing contained in this site, the Documentation, Hosted Service(s) and product(s) should be construed as granting, by implication, estoppel, or otherwise, any license or right in and to the Marks without the express written permission of Avaya or the applicable third party.

Avaya is a registered trademark of Avaya LLC.

All non-Avaya trademarks are the property of their respective owners.

Linux® is the registered trademark of Linus Torvalds in the U.S. and other countries.

## **Downloading Documentation**

For the most current versions of Documentation, see the Avaya Support website: <https://support.avaya.com>, or such successor site as designated by Avaya.

## **Contact Avaya Support**

See the Avaya Support website: <https://support.avaya.com> for Product or Cloud Service notices and articles, or to report a problem with your Avaya Product or Cloud Service. For a list of support telephone numbers and contact addresses, go to the Avaya Support website: <https://support.avaya.com> (or such successor site as designated by Avaya), scroll to the bottom of the page, and select Contact Avaya Support.

# Part 1: Introduction

# Chapter 1: Purpose

This document contains descriptions of the configuration fields and the configuration procedures for administering Avaya IP Office Platform using the IP Office Web Manager application. This document principally covers the IP Office Release 12.3.

## Intended audience

The primary audience for the Administering Avaya IP Office using IP Office Web Manager is the customer system administrators, implementation engineers and support and services personnel.

---

## New in IP Office Release 12.3

### Single Sign On (SSO) for Workplace Client and one-X Portal

Spaces-based messaging service is no longer available in IP Office. Instead, Instant Messaging is available for use with **OneXPortal**. Users have the following options to log in to the Workplace client:

- Single Sign On (SSO)
- Username and Password

The SSO login support in Avaya Workplace Client improves authentication and user access. For SSO to work with IP Office, you must:

- enable the SSO login
- set the messaging server to **OneXPortal**
- enable Avaya Cloud authentication

**One X Portal** handles the messaging service in the new environment. For more information, see the *IP Office Avaya Workplace Client Installation Notes*.

### Default lower limit for J100 page volume

Release 12.3 introduces the `SET_J100_PAGE_VOLUME_MIN` parameter, which sets a default minimum page volume level of 10 that cannot be lowered than 10 unless you set the `SET_J100_PAGE_VOLUME_MIN` parameter value to 1. Setting the `SET_J100_PAGE_VOLUME_MIN` parameter value to 1 disables this minimum page volume limit and the page volume can be lowered than 10. This configuration is managed through Non-User Specific Numbers (NUSN) in both Manager and Web Manager. The maximum upper value of page volume is 16. The configured value is retained after restart or power loss.

J100 phones restart if a different volume level is set on the server side, and the value configured on the server side overrides.

### Migration to Dell R660

IP Office Release 12.3 supports migrating an IP Office system from an HP DL360 server running version 11.1.3.2 to a Dell R660 server running IP Office 12.3 using the same production IP address. If you are using prior IP Office releases, you must first upgrade to R11.1.3.2 before migrating to 12.3. For more information, see the *Migrating IP Office on HP DL360 to Dell R660*.

[Purpose](#) on page 33

---

## New in IP Office Release 12.2 SP1

### Bulk downloading of Media Manager audio recordings using a script

IP Office supports bulk downloading of Media Manager audio recordings using a Visual Basic Script (VBScript). The workflow provides a fast, fully-automated method for exporting large volumes of recordings with improved efficiency.

### Media Manager capacity for searching or filtering records

- Using the search text box at the top of the screen: 20,000
- Using the search filter in the left pane on the screen: 35,000

### Browser support

IP Office applications support the following versions of browsers on Windows and Mac OS:

- Windows OS:
  - Edge: 140
  - Firefox: 143
  - Google Chrome: 140
- Mac OS:
  - Safari: 18.6
  - Chrome: 139

### Thick client support

IP Office supports thick clients applications on 32-bit and 64-bit Microsoft Windows.

### Spaces-based messaging is no longer available

Spaces-based messaging services is no longer available in IP Office. The option to select Avaya Spaces messaging using the **System > Messaging Server** page has been removed from IP Office Manager and IP Office Web Manager.

### End of support

Voicemail Pro integration with Microsoft Exchange Server 2016 and 2019 is no longer available.

[Purpose](#) on page 33

---

## New in IP Office Release 12.2

The following changes apply for IP Office R12.2:

### 9408 telephone support

IP Office systems that support 9500 Series phones now also support the 9408 phone. In terms of features and functions the 9408 phones match the operation of 9508 phones.

### Avaya Wireless DECT R5

Support for Avaya Wireless DECT R5 firmware was added in IP Office R12.1 SP1. In IP Office R12.2, the following changes have been made for Avaya Wireless DECT R5:

- **Avaya Wireless DECT R5 firmware**

The Avaya Wireless DECT R5 firmware is now included in the IP Office admin suite installation package.

- **Maximum DECT IP base station capacity increased**

For Avaya Wireless DECT R5 systems linked to a IP Office, the maximum IP base station capacity has increased from 256 to 1000.

- **Support for the Avaya Wireless DECT IPVM**

IP Office now supports the Avaya Wireless DECT IPVM software.

- The IPVM installs as a VMware virtual server
- The IPVM can act as the master base station for all other base stations.
- The IPVM does not include a radio component to directly support calls. DECT handsets must still connect a wireless DECT base station.

### Overriding the display of user button call options menus

For IP Office 12.2, you can use the NoUser Source Number `DISABLE_USERBLF_DND_MENU` to override the display of call options and instead have the button make an immediate call to the targeted user. The feature is supported with 9400, 9500, 9600, and J100 phones. For the call to

alert a DND user rather than be redirected as per normal DND operation, you must add the button user's number to the targeted user's **DND Exceptions** list.

### **Avaya Cloud Office Persistent gateway support**

Avaya Cloud Office (ACO) customers who also have an IP Office, can use the IP Office as a persistent gateway. IP Office acts as a failover PBX for ACO registered J100 Series SIP phones.

IP Office as an ACO persistent gateway is supported on IP Office IP500 V2 system running in Essential Edition, Preferred Edition, or subscription mode.

For more information, see *Using Avaya IP Office as an Avaya Cloud Office Persistent Gateway*.

### **Related links**

[Purpose](#) on page 33

---

## **New in IP Office Release 12.1 SP1**

The following changes apply for IP Office R12.1 SP1.

### **Avaya Wireless DECT**

- **Support for Avaya Wireless DECT R5**

IP Office supports the R5 release of Avaya Wireless DECT as well as the existing R4 release.

- To reflect this, the IP Office documentation now uses the term Avaya Wireless DECT rather than DECT R4.
- The R5 firmware is not include in the IP Office R12.1 admin suite installer. You can download the firmware from the Avaya support website.

- **Support for 1500 DECT extensions with Avaya Wireless DECT R5**

With Avaya Wireless DECT R5, the maximum DECT extension capacity on a Linux-based IP Office primary or secondary server has increased from 750 to 1500.

- The total extension capacity, DECT and non-DECT, must still remain within the extension capacity of the IP Office system and the whole IP Office solution.

### **Capacity**

- **TLS Extension Capacity**

The restriction that TLS extensions count as two extensions for IP Office capacity planning does not apply to the Avaya ASP 110 DELL R660 SRVR A2 IPO server.

### **Support for Microsoft Hyper-V on Windows Server 2022 and Windows Server 2025**

IP Office supports Microsoft Hyper-V on Windows Server 2022 and Windows Server 2025.

### **Related links**

[Purpose](#) on page 33

## New in IP Office Release 12.1

The following changes apply for IP Office R12.1:

### IPv6 support

For IP Office R12.1, IP Office systems can support IPv6 features in addition to the existing IPv4 features.

- IP Office supports IPv6 on Linux-based IP Office systems only.
- Use of IPv6 does not require any additional license or subscription.
- IPv4 remains always enabled. The IP Office does not support an IPv6 only mode.

The IPv6 features are:

#### • IP Addressing

Avaya supports IPv6 on IP Office LAN1. Avaya also supports IPv6 on LAN2 but only when IPv6 is enabled on LAN1 also.

#### • DHCPv6 Support

You can configure the IP Office to support DHCPv6. It can function as a DHCPv6 server or client on each IP Office LAN.

#### • Stateless Address Auto Configuration (SLAAC)

You can configure the IP Office to use SLAAC to assign its IPv6 address on LAN1 and/or LAN2. You can also configure the IP Office to respond as an IPv6 router for other devices that are using SLAAC.

#### • IPv6 Routing Support

You can configure the IP Office with static routes for IPv6 traffic.

#### • Avaya Workplace IPv6 Support

You can use IPv6 for Avaya Workplace Client extension connection. That includes connection as local and remote extensions.

- Avaya Workplace Client support for IPv6 with IP Office R12.1 requires Avaya Workplace Client R3.37 and higher.
- The IP Office licensing and configuration requirements for remote extensions are the same for IPv6 as for IPv4. The IP Office treats any extension using an IPv6 global unicast address not issued by IP Office DHCP as a remote extension.
  - The IP Office must have an FQDN that resolves to both the IPv4 and IPv6 addresses of the IP Office.
  - You must configure the one-X Portal host domain settings (**Configuration > Host Domain Name**) with the FQDN of the IP Office server running the one-X Portal service.
- Avaya Cloud Services do not support IPv6. Therefore, any Avaya Workplace Client using IPv6 cannot use features provided by Avaya Cloud Services. For example:
  - No client registration using email or SSO login.
  - No instant messaging if the IP Office uses Avaya Cloud Services as its messaging server.

- **J100 Phone IPv6 Support**

You can use IPv6 for J100 Series phone extension connection (except J129). That includes connection as local and remote extensions.

- IP Office support for IPv6 with J100 phones requires the phones to use J100 R4.1.6.0 or higher firmware.
- For IPv6, IP Office supports the J100 Series phones (except J129) in dual-stack mode with the signaling address set to IPv6 and the media IP preference set to IPv6 over IPv4 (64). That is the default configuration set in the auto-generated `46xxsettings.txt` file. For Avaya does not support the use of any other combination of signaling and media address mode as that can cause unexpected call failures.
- The IP Office licensing and configuration requirements for remote extensions are the same for IPv6 as for IPv4. The IP Office treats any extension using an IPv6 global unicast address not issued by IP Office DHCP as a remote extension.
- The IP Office must have an FQDN that resolves to both the IPv4 and IPv6 addresses of the IP Office.

- **Certificates**

The IP Office will include its IPv6 addresses when regenerating IP Office signed certificates.

- If using the IP Office self-signed certificates, you must regenerate the self-signed IP Office certificates after enabling IPv6 support.

All other IP Office connections and features use IPv4 as in previous IP Office releases.

## **Support for KVM virtual servers**

For IP Office R12.1, Avaya supports the deployment of IP Office virtual machines on the Avaya Solutions Platform 130 Appliance R6 platforms (ASP 130 R6). Avaya supplies the ASP 130 R6 with Red Hat Enterprise Linux 8.10 pre-installed and configured to support KVM based virtual machines.

## **J100 USB Headset support**

The J100 R4.1.6 firmware installed by default with IP Office R12.1 includes support for USB HID headsets on J100 Series phones that have USB ports (J159 and J189).

## **Related links**

[Purpose](#) on page 33

---

# **New in IP Office Release 12.0**

The following changes apply for IP Office R12.0:

- **Change of Linux Operating System**

The version of Linux used by Linux-based IP Office servers has changed from CentOS to Rocky Linux.

- The new Linux is supported on 64-bit servers only. For Unified Communications Module support see the notes below.

- For existing Linux-based IP Office systems upgrading to IP Office R12.0, you must upgrade using the processes in *Upgrading Linux-based IP Office Systems to R12.0*.

- **UCM support in IP Office R12.0 and higher**

The Unified Communications Module (UCM) cannot support the 64-bit Linux used for IP Office R12.0 and higher. Therefore, you cannot upgrade a UCM to run R12.0.x software. However, Avaya supports UCM modules running R11.1.3.2 software in IP Office R12.0 and higher systems with the following caveats:

- If the existing Unified Communications Module is running pre-R11.1 software, you must upgrade it to R11.1.3.2 using the processes in the "Upgrading Linux-based IP Office Systems to R11.1" manual.
- The IP Office system will output a UCM version mismatch alarm each time the IP Office is restarted. You can ignore this alarm.
- There will be no future updates to the IP Office software components provided on the UCM modules.
- There will be no any future updates for the CentOS operating system and no security CVE patches for UCM modules.

- **Display of Web Management Version**

For Linux-based IP Office systems, the **Control Unit** details shown in IP Office Manager now include details for the web management service.

- **End of Support**

The following are no longer supported:

- **Web Collaboration**

# Chapter 2: IP Office Web Manager

IP Office Web Manager is a browser based management tool designed to simplify the installation and maintenance process by providing an intuitive and user-friendly management tool that runs on most standard browsers. Web Manager eliminates the need to have Windows PC as it can run on any device that supports standard browsers.

## IP Office Types

IP Office is supported on a variety of platforms and running in a number of modes. This affects how web manager is accessed and the menus available within web manager.

| Platform | IP Office Mode    | Description                                                                                                                                             |
|----------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP500 V2 | Basic Edition     | This mode has its own separate web manager application that is not covered by this version of web manager.                                              |
|          | Essential Edition | These are referred to as 'Standard Mode'. Standard mode systems can be standalone or multiple systems can be linked in a Small Community Network (SCN). |

*Table continues...*

| Platform                    | IP Office Mode                    | Description                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                             | Preferred Edition                 | The base license is an Essential Edition license. Additional features are enabled with a Preferred Edition license.<br><br>Each IP500 V2 is managed separately through its own copy of web manager.                                                                                                                                                                                       |
|                             | Server Edition (Expansion Server) | In this mode, the IP500 V2 is part of the Server Edition network below and is managed through the web manager menus of the Server Edition primary server.                                                                                                                                                                                                                                 |
| Server PC<br>Virtual Server | Server Edition                    | A Server Edition network can consist of multiple servers, starting with a primary server to which a secondary and expansion servers are then added.<br><br>All the servers are managed through the web manager provided by the primary server.                                                                                                                                            |
|                             | Application Server                | This standalone server can run the IP Office one-X Portal and Voicemail Pro services. It can be used in two ways: <ul style="list-style-type: none"> <li>• With an IP500 V2 running in Preferred Edition mode, it can provide both services.</li> <li>• With a Server Edition, it can replace the one-X Portal service normally provided on the Server Edition primary server.</li> </ul> |
| UCM                         | Preferred Edition                 | This server on a card can be installed inside an IP500 V2 running in Preferred Edition mode (see above). It can then provide that system with one-X Portal and Voicemail Pro services. Web manager is used to access and manage those services and the shell mode (see below) settings of the UCM.                                                                                        |

### Shell Server Mode

Web manager is chiefly used to configure the IP Office service which provide telephony features such as users, extensions and lines.

The IP Office Application Server or UCM module do not provide telephony features. However, those servers still host a version of IP Office service that provides some options, mainly related to security and IP routing settings, necessary to connect with the full IP Office service on other servers. This minimal IP Office service is referred to as a "shell server" mode.

## Logging in to Web Manager

Use this procedure to log in to web manager via the default web links page provided by the IP Office system.

### Before you begin

- You must have an service user ID and password with administration rights. The password for the default `Administrator` account is set during the server's ignition (installation).
- You must know the IP address of the IP Office system.
  - **Server Edition:** Use the address of the primary server. Access via the address of the secondary or expansion server is only supported during server deployment.
  - **UCM module:** Use the address of the IP Office system hosting the module.
  - Use the LAN1 IP address where possible. Some features are not supported when using the LAN2 IP address:
    - Opening a client application, for example IP Office Manager, from web manager.
    - Opening the **Platform View** page from web manager.

### Procedure

1. In a web browser, enter the IP address of the IP Office system in the format `http://<ip_address>`.
2. Click on the required link for web manager: Click on:
  - **IP Office:** For the IP Office web manager, click **IP Office Web Manager**.

- **UCM Module:** For the web manager on the UCM module being hosted by the IP Office, click **IP Office Web Manager on UCM**.
3. On the login page, enter a user name and password.
  4. (Optional) If you want or need to edit the configuration offline, select the **Offline Mode** checkbox. See [Offline Mode](#) on page 55.
  5. Click **Login**.
    - Entering an invalid user name or password can cause further access to be blocked. The default is to block access for a minute following 3 failed attempts within 10 minutes. The options for this are set through the system's security settings.
    - You may be prompted to change your password. This is configured through the settings of service user account used.
    - IP Office allows five concurrent sessions using one administrator account. If exceeded, Web Manager displays `Limit of concurrent sessions per user exceeded`. Note that the following are also considered as sessions:
      - If the IP Office Manager application is connected using **SE Central Access**.
      - If the same administrator account has been used to log in any third-party application developed using the IP Office Management SDK.

## Result

After logging in:

- Details of the last login using the same service user account are displayed.
- If configured, a security warning may be displayed.
- By default you will be automatically logged out after a period of inactivity set in the web manager preferences. See [User Preferences](#) on page 52.

# Logging in without a certificate

Importing a common certificate into the browser's trusted store provides additional security. If you do not install a certificate, you receive a message that the site is not trusted when logging in to web manager.

When that occurs, you can still continue with the logging in using the process below. This is not recommended for normal operation but is sometimes necessary with accessing a newly installed system.

## Procedure

1. In a web browser, enter the IP address of the system in the format `http://<ip_address>/index.html`.

2. Click on **IP Office Web Manager**.
3. A page opens with the statement “This connection is untrusted”. Click **I understand the risks**.
4. Click **Add Exception**.
5. Select **Permanently store this exception**
6. Click **Confirm Security Exception**.
7. Continue to the log in procedure.

### Next steps

- See [Logging in to Web Manager](#) on page 42.

### Related links

[Logging in to web manager](#) on page 42

---

## Logging out of Web Manager

Use this procedure to log out of Web Manager.

### Procedure

1. In the upper right corner of the Web Manager interface, click **Logout**.
2. You receive a prompt to confirm the log out. Click **OK**.
3. You are logged out of the current session and returned to the login screen.

## Web Manager Service Users

The IP Office service user account used to login to web manager, determines what actions can be performed. By default the `Administrator` account has full access. However, that can be changed and other service users can be created with different levels of access.

Each service user is configured as a member of various **Rights Groups**. Those group define what the service user can do within web manager (and other interfaces that access the IP Office system). Configuration of service users and rights groups is done through the server's security configuration which is accessible as part of web manager (if your service user account is a member of a rights group with security configuration permission).

# Changing your password

Use the following process to change your own password.

## Procedure

1. Click the  icon in the top right corner of the screen.
2. Click **Preferences**.
3. Click the  pencil icon next to the **Password** field.
4. Enter your new password into the **Password** and **Confirm Password** fields.
5. Enter your existing password in the **Old Password** field.
6. Click **Update**.

## The Menu Bar and Solution Display

The screenshot below shows an example IP Office Server Edition network, as seen by accessing the web manager of the primary server. The web manager view differs for other types of IP Office server, but largely contains the same controls.

| Item                        | Description                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1. Menu Bar</b>          | Use these options to navigate to various sub-menus. The menus vary depending on the type of IP Office system(s) being managed. See <a href="#">Menu Bar Options</a> on page 48.                                                                                                                                                                          |
| <b>2. User Preferences</b>  | The  icon is used to access the following options: <ul style="list-style-type: none"> <li><b>User Preferences</b> - See <a href="#">User Preferences</a> on page 52.</li> <li><b>Logout</b> - See <a href="#">Logging out of Web Manager</a> on page 44.</li> </ul>                                                                                      |
| <b>3. Help</b>              | The help menu contains: <ul style="list-style-type: none"> <li><b>Documentation</b> - Access online help for web manager: <i>Administering Avaya IP Office™ Platform with Web Manager</i></li> <li><b>Avaya Support</b> - Access the <a href="#">Avaya Support</a> web site.</li> <li><b>About</b> - Display the web manager version details.</li> </ul> |
| <b>4. Solution Settings</b> | Provides options to support web manager operation. Not shown for IP500 V2 web manager. See <a href="#">Solution Button Menus</a> on page 49.                                                                                                                                                                                                             |
| <b>5. Solution Objects</b>  | Only shown for IP Office Server Edition. Click  to a summary of the number of key configuration items.<br><br>Clicking on any ( <b>Users, Groups, Short Codes, Directories, Time Profiles, Locations, Account Codes</b> and <b>User Rights</b> ), displays a list of those items that can be used to add, edit or delete entries.                        |

Table continues...

| Item                      | Description                                                                                                                                                                                                                                                                                                         |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>6. Actions</b>         | Provides a range of configuration actions to be performed on the server or in a network, selected servers. See <a href="#">Solution Button Menus</a> on page 49.                                                                                                                                                    |
| <b>7. Configure</b>       | Only shown for IP Office Server Edition. Provides options to add, remove and link the multiple servers in the Server Edition network. See <a href="#">Solution Button Menus</a> on page 49.                                                                                                                         |
| <b>8. Server Settings</b> | The  icon is used to access a range of server specific options. See <a href="#">Solution Button Menus</a> on page 49.<br><br>This option is not shown for IP500 V2 web manager. Instead use <b>Actions &gt; Service Commands</b> . |
| <b>9. Filter Panel</b>    | Filter panels are shown on various screens in web manager. They can be used to show only matching entries.                                                                                                                                                                                                          |
| <b>10. Server Details</b> | Use the  icons to show additional details of the server such as its software version, the key services it is running and their versions. Not shown for IP500 V2 web manager.                                                       |

## Menu Bar Options

The menu bar provides access to the options listed below.

The availability of the **Call Management** and **System Settings** options depend on the type of IP Office system being managed. Similarly, the commands provided by each menu also vary.

| Menu                   | Description                                                                                                                                                                                                                                                                        |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Solution</b>        | Display the solution menu. See <a href="#">The Menu Bar and Solution Display</a> on page 46. For IP500 V2 systems, this is the server dashboard.                                                                                                                                   |
| <b>Call Management</b> | This drop-down menu is available in the menu bar of systems running the full IP Office server to support telephony. It is not shown on IP Office Application servers and UCM modules. For a summary of the options, see <a href="#">Types of Configuration Records</a> on page 59. |
| <b>System Settings</b> | This drop-down menu is available in the menu bar of systems running the full IP Office server to support telephony. It is not shown on IP Office Application servers. For a summary of the options, see <a href="#">Types of Configuration Records</a> on page 59.                 |
| <b>Security</b>        | Access the security settings for the server or servers.                                                                                                                                                                                                                            |
| <b>Applications</b>    | Access additional menus and services.                                                                                                                                                                                                                                              |

## Record Consolidation

By default, to maintain the configurations of the systems in a Server Edition solution in synch, certain types of configuration records are consolidated. That is, they are replicated in the individual configuration of each system in the network. Consolidation is applied to:

- **Short Codes** - System short codes only.
- **Time Profiles**
- **Account Codes**
- **User Rights**
- **Locations** - Even when consolidated, the **Emergency ARS** and **Fallback System** settings for each location are configured individually on each system.

**Consolidate Network Operation**

Use of consolidated settings is controlled by the  > **Preferences** > **Consolidate Objects** setting.

| Setting  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Offline Mode

By default, Web Manager operates in real time and configuration changes are applied to the IP Office system immediately. However, some settings can only be changed in offline mode. Web manager will indicate when that is the case.

In this mode, you can make multiple changes to the configuration and then apply them using the **Save to IP Office** action. Depending on the settings changed, this may cause a reboot of the IP Office service and ends all calls currently in progress.

Navigation:  > **Offline Mode**

### Using Offline Mode

To select offline mode, click  > **Offline Mode**. Once in **Offline Mode**:

- The  > **Offline Mode** changes to **Save to IP Office**.
- The **Save to IP Office** option is also available above the menu bar.

### Saving Setting in Offline Mode

After clicking **Save to IP Office**, web manager displays a save dialog with the following settings. Configure the menu as required and click **OK**.

| Setting                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>IP Office</b>         | Select the system to which settings should be saved. In a Server Edition network, more than one server may be shown.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Change Mode</b>       | <p>Select the method of saving:</p> <ul style="list-style-type: none"> <li>• <b>Merge</b> - This method is automatically selected if none of the configuration changes made require a system reboot. If this method is used for a configuration that includes changes that do require a reboot, those changes are not applied until the system is manually rebooted.</li> <li>• <b>Immediate</b> - This method saves the new configuration changes and then restarts the system. Any current calls and services in progress are ended. This method is automatically selected if any of the changes made so far require a reboot before they are applied to the system.</li> <li>• <b>Free</b> - This method allows the <b>Incoming Call Barring</b> and <b>Outgoing Call Barring</b> options to be used. The system reboots when the criteria for the selected options are matched.</li> <li>• <b>Timed (HH:MM)</b> - This method reboots the system at the selected time. It can also be used with the call barring options to only reboot after the set time when the selected options are matched.</li> </ul> |
| <b>Reboot Time</b>       | Set the time for the reboot if <b>Timed (HH:MM)</b> is the selected save method.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Incoming Call Bar</b> | This option can be used with the <b>Free</b> and <b>Timed</b> reboot methods. When selected, the system bars any further incoming calls. However, it allows existing calls to continue until they are ended.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Outgoing Call Bar</b> | <p><b>Outgoing Call Barring</b> - This option can be used with the <b>Free</b> and <b>Timed</b> reboot methods. When selected, the system bars any further outgoing calls. However, it allows existing calls to continue until they are ended.</p> <p> <b>Warning:</b></p> <ul style="list-style-type: none"> <li>• <u>This option also bars the making of emergency calls.</u> Therefore, it should be used with caution.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### Settings that can only be edited in Offline Mode

The following table lists the configuration settings which can only be edited in **Offline Mode**.

| Settings                                                   | Offline Only | Exceptions                                           |
|------------------------------------------------------------|--------------|------------------------------------------------------|
| <b>Call Management &gt; Extensions &gt; Edit Extension</b> |              |                                                      |
| <b>Common</b>                                              | All          |                                                      |
| <b>H323</b>                                                | All          |                                                      |
| <b>SIP VoIP</b>                                            | All          |                                                      |

# Chapter 5: Displaying and Managing Configuration Records

The system configuration consists of collections of different types of records. For example user records, group records, etc. The menu bar across the top of the browser window is the main route for accessing the lists of particular records types.

From the lists, which you can sort and filter, you can add, edit and delete records.

## Types of Configuration Records

The following different types of configuration records can be selected from the menu bar options.

### Call Management

This drop-down menu is available in the menu bar of systems running the IP Office service to support telephony. It is not shown on IP Office Application servers and Unified Communications Module.

| Sub-Menu               | Description                                                                                                                                                                                                                         |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Auto Attendants</b> | Auto-attendants are services that the system can provide to answer calls and prompt the caller for which service they require or who they want to talk to. Auto attendants can be used as the destination for incoming call routes. |
| <b>Conferences</b>     | In addition to ad-hoc and personal conference features, systems support system meet-me conferences.                                                                                                                                 |
| <b>Extensions</b>      | Each physical phone (desk phone) registered with the system requires a matching extension record in the system configuration.                                                                                                       |
| <b>Groups</b>          | Groups are collections of multiple users. Each group has an extension number and can be used as the destination for calls.                                                                                                          |
| <b>Users</b>           | Users are the individual users who make and answer calls. They can do this via physical phones or softphone applications.                                                                                                           |

## System Settings

This drop-down menu is available in the menu bar of systems running the IP Office service to support telephony. It is not shown on IP Office Application servers and Unified Communications Module.

| Menu/Sub-Menu                    | Description                                                                                                                                                                                                                                                                                                                      |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Account Code</b>              | Account codes can be used to track calls. Users can either voluntarily enter an account code during a call, or for certain numbers, be forced to enter a valid account code in order to make a call.                                                                                                                             |
| <b>Alternate Route Selection</b> | Alternate Route Selection (ARS) records are used to control the routing of outgoing calls. Short codes within the ARS record are matched against the number to dial to see which line to use or whether it is barred and to change the number actually dialed from the system if necessary.                                      |
| <b>Authorization Code</b>        | Each authorization code is associated with a particular user. That code allows the user to temporarily override the settings of another user's phone and make a call from it using their own settings.                                                                                                                           |
| <b>Firewall Profile</b>          | Configure firewall profiles which can then be applied to IP connections.                                                                                                                                                                                                                                                         |
| <b>Incoming Call Route</b>       | Incoming call routes records are used to control the routing of incoming calls. Various aspects of the incoming call (for example the line it is on and the caller ID) are compared for matches to the available ICR records. The destination settings in the ICR record that is the best match are then used to route the call. |
| <b>IP Route</b>                  | This menu is used to configure static IP routes to control the routing of matching IP addresses and address ranges.                                                                                                                                                                                                              |
| <b>Licenses</b>                  | This menu is used to configure the license source settings on non-subscription systems.                                                                                                                                                                                                                                          |
| <b>Line</b>                      | Lines are used for external calls, both incoming and outgoing.                                                                                                                                                                                                                                                                   |
| <b>Locations</b>                 | Location records can be used to identify where particular extensions are physically located and to apply settings that need to differ from that location.                                                                                                                                                                        |
| <b>RAS</b>                       | A Remote Access Server (RAS) is a piece of computer hardware which sits on a corporate LAN and into which employees dial on the public switched telephone network to get access to their email and to software and data on the corporate LAN.                                                                                    |

*Table continues...*

| Menu/Sub-Menu           | Description                                                                                                                                                                                                                                                                                      |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Services</b>         | Services are used to configure the settings required when a user or device on the LAN needs to connect to a another network. Services can be used when making data connections via trunk or WAN interfaces. Once a service is created, it can be used as the destination for an IP Route record. |
| <b>Short Codes</b>      | Dialing by users on the system can be compared to short codes. When a match occurs, the matching short code sets what should happen. This may be the triggering of some feature, changing a system setting, or changing the dialed number.                                                       |
| <b>Subscription</b>     | On subscription mode systems, display the subscriptions obtained and the settings used.                                                                                                                                                                                                          |
| <b>System Directory</b> | The system directory contains records for external contacts, that is their names and numbers. These can be displayed on phones in order to make outgoing calls. They can also be used to match a name to the number on incoming calls.                                                           |
| <b>System</b>           | This menu gives access to a set of sub-menus for settings that control system-wide behavior.                                                                                                                                                                                                     |
| <b>Time Profiles</b>    | Time profiles contains time, date and weekly schedule settings. Using those each time profile is currently either 'true' or 'false'. That value is used to change the behavior of other types of record that can be linked to the time profile such as incoming call routes.                     |
| <b>Tunnel</b>           | These menus can be used to create L2TP and IPSec tunnels to other servers and services. Supported on IP Office IP500 V2 systems only.                                                                                                                                                            |
| <b>User Rights</b>      | User rights can be used to override some of the individual settings of some users. Changes to the user rights are then automatically applied to all those users rather than having to individually edit each user.                                                                               |
| <b>WAN Port</b>         | Use these menus to configure physical and virtual WAN ports.                                                                                                                                                                                                                                     |

## Security/Security Settings

The **Security** menu allows you access to the overall security settings of the system.

| Menu/Sub-Menu        | Description                                                                                                                                                                               |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>General</b>       | General settings such as the password rules for service users and for general system users.                                                                                               |
| <b>System</b>        | General system settings for ports.                                                                                                                                                        |
| <b>Services</b>      | The ports on which the system's services listen for access and the security used for that access.                                                                                         |
| <b>Rights Groups</b> | Rights groups define what the different security service users that are members of the group can do.                                                                                      |
| <b>Certificates</b>  | This menu lists the security certificates stored by the system and allows processes such as adding and changing certificates.                                                             |
| <b>Service Users</b> | Service users are the accounts used by administrators and services to connect to the system. The service user's permissions are defined by the <b>Rights Groups</b> to which they belong. |

## Displaying Configuration Records

There are two types of configuration record:

- For some records there is only one record for the server. Selecting the option from the menu bar displays the settings of that record:
  - For servers in a Server Edition network, for **System** and **Security** settings, each server has its own configuration record. A list of servers is displayed from which you can select which server's configuration record you want to access.
- For other records, such as users and group, there can be multiple records of that type. You can add or delete records. Selecting the appropriate option from the menu bar displays a list of all the existing records.

### Procedure

1. From the menu bar, select the type of configuration record that you want to manage.
  - If there is only one configuration record of that type, its settings are displayed.
  - For Server Edition, if a list of servers is displayed, selected the server whose configuration record you want to view.
  - For other record types, a list of all the existing records is displayed.
2. When a list of configuration records is displayed, use the following methods to manage those records:
  - **Sort:** See [Sorting the list](#) on page 63.
  - **Search:** See [Searching the list](#) on page 63.
  - **Filter:** See [Filtering the list](#) on page 63.
  - **Add:** See [Adding a New Record](#) on page 64.
  - **Edit:** There are several ways in which you can edit the entries shown in a list of configuration entries.
    - **Quick Edit:** For extensions, users and groups, you can edit the displayed details of a record directly in the list. See [Quick Edit](#) on page 64.
    - **Full Edit:** See [Editing an Existing Entry](#) on page 65.
    - **Edit Multiple:** For users, you can select and edit multiple entries. See [Editing Multiple User Records](#) on page 65.
  - **Delete:** See [Deleting a Record](#) on page 66.
3. To stop displaying the list, click **Solution**.

## Filtering the list

You can use the checkboxes on the right to what records you want to display. If no check boxes are selected, the list defaults to displaying all records.

### Procedure

1. Use the checkboxes to filter the list of matching records.
  - a. Click on the checkbox or its label to select or deselect it.
  - b. To remove all the currently selected check boxes in a particular category, click on the **X** icon.
  - c. To deselect all check boxes, click on **Show All**.
2. When using the actions above, after a short pause the list is updated to only show records that match the selected checkboxes or all records if no checkboxes are selected.

## Searching the list

You can filter the list by performing a search for entries that match a keyword you enter. The search box at the top of the list indicates the column names to which the search is applied.

You can use a search in conjunction with the filtering checkbox options.

### Procedure

1. In the search box at the top of the list, enter your search term.
2. Click on the  icon.
3. The list of entries is filtered to show only matching entries.
4. To clear the search, either manually remove your search terms or click on **Show All**.

## Sorting the list

The list of configuration records can be sorted.

### Procedure

1. Click on the column header. The list is sorted using that column and an icon is shown next to the column header.
2. To reverse the direction of the sorting, click on the same column header again.

## Adding a New Record

Use this process to add a new configuration record to the existing list of records.

- New users, extensions and SIP trunks created using templates. Refer to the configuration settings for those records for details. See [Using User and Extension Templates](#) on page 84.

### Procedure

1. Click the **+ Add** button.
  - In some cases, you are prompted to select a sub-type. For example, if adding an extension, you may be prompted to select either **SIP** or **H.323**.
  - If the system is part of a network of servers, you may also be prompted for which server should host the new configuration record.
2. Use the form to enter the details as required.
3. When you have configured the record as required, click **Create**.
  - When creating a user record, the system will prompt you whether it should also create a matching extension record.

---

## Quick Edit

Each list of configuration entries displays keys settings. For extensions, users and groups, those key settings can be edited directly in the list rather than having to access the full set of settings for each record.

### Procedure

1. Click on the existing details displayed for the record that you want to edit.
2. The existing details change to a set of editable fields. Change these details as required.
3. When completed, click **Save**.

[Displaying and Managing Configuration Records](#) on page 59

---

## Editing an Existing Entry

Use the following process to edit an entry in the currently displayed list.

**Procedure**

1. Click the  pencil icon next to the entry.
2. Change the settings as required.
3. When completed, click **Update**.

**Related links**

[Displaying and Managing Configuration Records](#) on page 59

---

## Editing Multiple User Records

The list of user entries can be used to edit multiple users at the same time. You can select which settings to edit and apply to all the users.

**Procedure**

1. Click **Call Management > Users** and sort/filter the list as required.
2. Click the checkbox next to each of the users you want to edit.
3. Click **Edit Multiple**.
4. For each setting that you want to change for all the selected users:
  - a. Click the checkbox next to the setting.
  - b. Change the setting to the required value for all the selected users.
  - c. Repeat this process for any other setting that you want to change for all the selected users.
5. When completed, click **Update**.

## Deleting a Record

Use the following process to delete a record from the list.

- Before deleting an entry, check that it is not being used as the destination for any other functions such as an auto-attendant action or incoming call route.
- For IP500 V2 servers, configuration records that match physical ports in the system (extension and line ports) cannot be deleted. If removed, the record is automatically recreated with default settings when the system is next restarted.

### Procedure

1. Click on the  trash can icon next to the entry to delete.
2. Click **Yes** to confirm the deletion.

## Deleting Multiple Records

Use the following process to delete several records from the list.

- Before deleting an entry, check that it is not being used as the destination for any other functions such as an auto-attendant action or incoming call route.
- For IP500 V2 servers, configuration records that match physical ports in the system (extension and line ports) cannot be deleted. If removed, the record is automatically recreated with default settings when the system is next restarted.

### Procedure

1. Select the checkbox next to the records to be deleted.
2. Click the **Delete** button at the top of the lists.
3. Click **Yes** to confirm the deletion.

# Chapter 6: The Setup Wizard/Initial Configuration

IP Office Web Manager displays the setup wizard when it connects to a new IP Office server for the first time (except IP Office Application Server and Unified Communications Module). The setup wizard consists of a number of panels, each of which you can use to configure a different area of the IP Office server configuration.

- Click on a panel to access its settings.
  - On a new IP Office system, you can only access the panels in sequence, starting with the **System** panel.
  - After you have configured the settings in a panel, the panel displays a summary of those settings and you can access the next panel.
  - After you have configured the settings within a panel, you can return to it at any time.
- Some of the panels alter settings that require an IP Office system reboot. Therefore, on a new server the setup wizard runs in offline mode. When completed, clicking **Save to IP Office** applies the settings and restarts the IP Office.
- The **System** panel is also called the **Initial Configuration Utility (ICU)**.
  - On systems that have already completed initial configuration, you can return to this menu using  > **Initial Configuration** (IP500 V2: **Actions** > **Initial Configuration** for IP500 V2).
- On standalone IP500 V2 systems, IP Office Web Manager displays the panels as the system's **Solution** display and as the dashboard (**Solution** > **Server Menu** > **Dashboard**).

## Setup Wizard: Panels Summary

The following tables provide a brief summary of the role of each panel. It also indicates their availability which may depend on other settings or the type of IP Office server.

| Panel                       | Description                                                                                                                        |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>               | Configure general system settings such as IP Office mode, locale and IP addresses.                                                 |
| <b>VoIP</b>                 | Configure the system's settings for H.323 and SIP telephony.                                                                       |
| <b>Voicemail</b>            | Configure the system's use of voicemail to handle unanswered and missed calls.                                                     |
| <b>Licensing</b>            | Configure the system PLDS license settings and upload a license file. This panel is not shown on IP Office subscription systems.   |
| <b>Subscription</b>         | Display details of the system subscription settings and subscriptions. This panel is only shown on IP Office subscription systems. |
| <b>Users</b>                | Configure the system users.                                                                                                        |
| <b>Groups</b>               | Configure groups of users. Each group has its own extension number which allows it to be used as the destination for calls.        |
| <b>Lines</b>                | Configure external telephone lines.                                                                                                |
| <b>Incoming Call Routes</b> | Configure the destination for incoming external calls based on the lines being used and the incoming telephone number.             |
| <b>Outgoing Call Routes</b> | Configure the settings applied to outgoing external calls by default and for particular users if required.                         |

| Panel                        | Server Edition       |           | IP500 V2 |
|------------------------------|----------------------|-----------|----------|
|                              | Primary<br>Secondary | Expansion |          |

## Setup Wizard: System Panel (Initial Configuration Utility)

This is the only mandatory panel in the setup wizard. This menu is also called the **Initial Configuration** utility.

On IP Office systems that have already completed initial configuration, you can return to this menu using  > **Initial Configuration** (IP500 V2: **Actions** > **Initial Configuration**).

### Common Settings

| Option                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Option                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Locale</b>                     | This setting sets default telephony and language settings based on the selection. It also sets various external line settings and so must be set correctly to ensure correct operation of the system. See <i>Avaya IP Office Locale Settings</i> . For individual users, the system settings can be overridden through their own locale setting ( <b>User &gt; User &gt; Locale</b> ).                                                                 |
| <b>Default Extension Password</b> | Default = Existing default extension password<br><br>The field provides you with option to view and edit the existing default extension password. The default extension password is set up during IP Office installation either by the administrator or is randomly generated by the system. The system generated random password is of 10 digits. Use the Eye icon to see the existing default password. The password must be between 9 to 13 digits. |
| <b>Hosted Deployment</b>          | This option is only used on non-subscription Server Edition system. If enabled, it indicates that the system is a hosted deployment.                                                                                                                                                                                                                                                                                                                   |
| <b>Services Device ID</b>         | This setting is shown for Server Edition servers only. The ID is displayed on the <b>Solution</b> view, <b>System Inventory</b> and on the <b>System &gt; System</b> tab in the configuration.<br><br><ul style="list-style-type: none"> <li>The value can be changed using the <b>Device ID</b> field on the <b>System &gt; System Events</b> configuration tab.</li> </ul>                                                                           |

### Subscription System Details

These details are only shown for subscription mode systems. They are used by the system to obtain its subscriptions. They details required are supplied when the system is registered for subscription.

| Name                          | Description                                                                                                                                                                                                                               |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System ID</b>              | This is a fixed value against which the system's subscriptions are issued and validated.<br><br><ul style="list-style-type: none"> <li>For an IP500 V2 system, this ID is based on the System SD card installed in the system.</li> </ul> |
| <b>Customer ID</b>            | The customer ID specified when the system was registered for subscriptions.                                                                                                                                                               |
| <b>License Server Address</b> | The address of the server which provides the system with its subscriptions.                                                                                                                                                               |

### LAN Configuration Settings

| Name                        | Description                                                                                                                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Public LAN Interface</b> | Select which of the server's LAN interfaces is connected to the customer network routed to the external internet. Additional IP Route details are added to the system configuration based on this choice.                                         |
| <b>Gateway</b>              | The address of the default gateway on the customer network to which non-LAN traffic should be routed.<br><br>After initial configuration, a default IP route is created, using this address and the selected <b>Public LAN Interface</b> setting. |

| <b>DNS Server</b>                                                       | The address used on the customer network for resolution of DNS queries. This is either the customer's DNS server or the DNS address provided by their internet service provider.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>LAN1 CONFIGURATION/LAN2 CONFIGURATION</b>                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Separate sets of LAN configuration details are shown for LAN1 and LAN2. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>IP Address</b>                                                       | The base IP address for the LAN. The defaults are 192.168.42.1 for LAN1 and 192.168.43.1 for LAN2.<br><br>If the server is acting as the DHCP server for the LAN, this is the starting address for the DHCP address range.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>IP Subnet Mask</b>                                                   | Default = 255.255.255.0. This is the IP subnet mask used with the IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>DHCP Mode</b>                                                        | Select whether the server performs DHCP for the LAN.<br><br><ul style="list-style-type: none"> <li>• <b>Server</b> - When this option is selected, the system will act as a DHCP Server on this LAN, allocating address to other devices on the network and to PPP Dial in users. <ul style="list-style-type: none"> <li>- Devices on requesting an address are allocated addresses from the bottom of the available address range upwards.</li> <li>- Dial In users are allocated addresses from the top of the available range downwards.</li> <li>- If the control unit is acting as a DHCP server on LAN1 and LAN2, Dial in users are allocated their address from the LAN1 pool of addresses first.</li> </ul> </li> <li>• <b>Disabled</b> - When this option is selected, the system will not use DHCP to get or issue IP addresses.</li> <li>• <b>Dial In</b> - When this option is selected, the system will allocate DHCP addresses to PPP Dial In users only. On systems using DHCP pools, only addresses from a pool on the same subnet as the system's own LAN address will be used.</li> <li>• <b>Client</b> - When this option is selected, the system request its IP Address and IP Mask from another DHCP server on the LAN.</li> </ul> |
| <b>Enable NAT</b>                                                       | Default = Off.<br><br>Shown for IP500 V2 systems only. This setting controls whether NAT should be used for IP traffic from LAN1 to LAN2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Solution Settings

These settings are shown for Linux-based systems. The options vary depending on the server's role in the network (primary, secondary or expansion).

| Name                                   | Description                                                                     |
|----------------------------------------|---------------------------------------------------------------------------------|
| <b>Server Edition Primary Server</b>   | For secondary and expansion servers, specify the address of the primary server. |
| <b>Server Edition Secondary Server</b> | For primary and expansion servers, specify the address of the secondary server. |

*Table continues...*

| Name                      | Description                                                                                                                                                                                                                                                                        |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>WebSocket Password</b> | For each of the addresses set above, a bi-directional WebSocket connection is created. A matching password must be set at each end of the line.                                                                                                                                    |
| <b>DNS Server</b>         | This is the IP address of a DNS Server. If this field is left blank, the system uses its own address as the DNS server for DHCP client and forwards DNS requests to the service provider when <b>Request DNS</b> is selected in the service being used ( <b>Service &gt; IP</b> ). |

## Time Settings

These settings are shown for non-subscription IP500 V2 servers only. They are only shown in the IP Office Web Manager initial configuration menu.

| Name                                                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Centralized Management

The following settings are used for IP Office systems being deployed as branch systems in a network managed using System Manager. Refer to the *Deploying Avaya IP Office™ Platform as an Enterprise Branch with Avaya Aura® Session Manager* manual.

| Name                                          | Description                                                                                        |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------|
| <b>Under Centralized Management</b>           | When selected, the additional fields below are shown.                                              |
| <b>SMGR Address</b>                           | Enter the IP address of the System Manager server managing the branch network.                     |
| Redundant SMGR Address                        | Enter the IP address of the secondary System Manager server managing the network.                  |
| <b>SMGR Community</b>                         | The shared community name for servers within the branch network.                                   |
| <b>SNMP Device ID</b>                         | The unique SNMP ID for the IP Office server within the network.                                    |
| <b>Trap Community</b>                         | The public name for sending SNMP trap alarms.                                                      |
| <b>SCEP Domain Certificate Name</b>           | The domain name for SCEP (Simple Certificate Enrollment Protocol) operation in the branch network. |
| <b>Certificate Enrollment (SCEP) Password</b> | The password for requesting certificates from the network's SCEP server.                           |

## Setup Wizard: VoIP

You can use this panel to configure the H.323 Gatekeeper and SIP Registrar support provided on each of the system's LAN interfaces.

**LANS**

| Field             | Description                                                  |
|-------------------|--------------------------------------------------------------|
| <b>Select LAN</b> | Use this control to switch between configuring LAN1 or LAN2. |

**H.323 Gatekeeper**

These settings relate to the H.323 extension support provided by the system on the currently selected LAN.

| Field                          | Description                                                                                            |
|--------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>H.323 Gatekeeper Enable</b> | Default = Off<br>If enabled, the system will support H.323 trunk and extension connections on the LAN. |

| Field                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>H.323 Signaling over TLS</b>   | <p>Default = Disabled. For hosted deployments, default = Preferred.</p> <p>When enabled, TLS is used to secure the registration and call signaling communication between IP Office and endpoints that support TLS. The H.323 phones that support TLS are 9608, 9611, 9621, and 9641 running firmware version 6.6 or higher.</p> <p>When enabled, certificate information is configured in the <code>46xxSettings.txt</code> file on IP Office and automatically downloaded to the phone. When IP Office receives a request from the phone for an identity certificate, IP Office searches its trusted certificate store and finds the root CA that issued its identity certificate. IP Office then provides the root CA as an auto-generated certificate file named <code>Root-CA-xxxxxxxx.pem</code>.</p> <p>For information on IP Office certificates, see <b>Security &gt; Certificates</b>.</p> <p>The options are:</p> <ul style="list-style-type: none"> <li>• <b>Disabled:</b> TLS is not used.</li> <li>• <b>Preferred:</b> Use TLS when connecting to a phone that supports TLS.</li> <li>• <b>Enforced:</b> TLS must be used. If the phone does not support TLS, the connection is rejected.</li> </ul> <p>When set to <b>Enforced</b>, the <b>Remote Call Signaling Port</b> setting is disabled.</p> <p>If TLS security is enabled (<b>Enforced</b> or <b>Preferred</b>), it is recommended that you enable a matching level of media security on <b>System Settings &gt; System &gt; VoIP Security</b>.</p> |
| <b>H.323 Remote Extn Enable</b>   | <p>Default = Off</p> <p>The system can be configured to support remote H.323 extensions in the case where NAT is used in the connection path. This could be the case where the IP Office is located behind a corporate NAT/Firewall router and/or the H.323 phone is located behind residential NAT enable router.</p> <p>Currently, only 9600 Series phones are supported as H.323 remote extensions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Remote Call Signaling Port</b> | <p>Default = 1720</p> <p>The call signaling port used for remote H.323 extensions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SIP Remote Extn Enable</b> | <p>Default = Off.</p> <p>The system can be configured to support remote SIP extensions in the case where NAT is used in the connection path. This could be the case where the IP Office is located behind a corporate NAT/Firewall router and/or the SIP phone is located behind residential NAT enable router.</p> <ul style="list-style-type: none"> <li>• This option cannot be enabled on both LAN1 and LAN2.</li> <li>• The use of this option and the interaction and configuration of external third party elements is beyond the scope this help file.</li> </ul> <p>In the case where the public IP address of the corporate router is unknown, the LAN's Network Topology settings should be used to configure a STUN Server. Enabling <b>SIP Remote Extn Enable</b> allows configuration of:</p> <ul style="list-style-type: none"> <li>• the <b>Remote UDP Port, Remote TCP Port, Remote TLS Port</b> settings</li> <li>• the <b>Port Number Range (NAT)</b> settings</li> </ul> |
| <b>SIP Domain Name</b>        | <p>Default = Blank</p> <p>This value is used by SIP endpoints for registration with the IP Office system. SIP endpoints register with IP Office using their SIP address that consists of their phone number and IP Office SIP domain. Since IP Office does not allow calls from unauthorized entities, the SIP domain does not need to be resolvable. However, the SIP domain should be associated with FQDN (Fully Qualified Domain Name) for security purposes. The entry should match the domain suffix part of the SIP Registrar FQDN below, for example, <code>example.com</code>. If the field is left blank, registration uses the LAN 1, LAN2, or public IP address.</p> <p> <b>Note:</b></p> <p>For Avaya SIP telephones supported for resilience, the <b>SIP Domain Name</b> must be common to all systems providing resilience.</p>                                                            |
| <b>SIP Registrar FQDN</b>     | <p>Default = Blank</p> <p>The fully-qualified domain name to which the SIP endpoint send their registration requests. For example, <code>sbc.example.com</code>.</p> <ul style="list-style-type: none"> <li>• This FQDN is also used for <b>Avaya Cloud Services</b> and <b>Avaya Push Notification Services</b></li> </ul> <p>The customer DNS must resolve this FQDN to an IP address that routes to the IP Office. That is:</p> <ul style="list-style-type: none"> <li>• For local extensions, the IP address of the IP Office LAN.</li> <li>• For remote extensions, the external IPv4 address of the Avaya SBC or customer firewall that routes to the IP Office.</li> </ul>                                                                                                                                                                                                                                                                                                            |

## Voicemail

| Name                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Voicemail Type</b>       | <p>Sets the type of voicemail service used by the system. The options supported depend on the type of IP Office system.</p> <ul style="list-style-type: none"> <li>• <b>Server Edition Systems</b><br/>These systems are supported by <b>Voicemail Pro</b> running on the primary server. All other servers in the Server Edition network should be set to <b>Centralized Voicemail</b>.</li> <li>• <b>Standalone IP500 V2 Systems</b><br/>These can support a range of options: <ul style="list-style-type: none"> <li>- <b>Voicemail Pro</b> - Use the Voicemail Pro service provided by an IP Office Application server.</li> <li>- <b>Centralized Voicemail</b> - In an SCN network of IP500 V2 systems, only the Voicemail Pro server associated with one IP500 V2 system holds the messages and recording (the centralized voicemail server). All other systems should be set to <b>Centralized Voicemail</b> or <b>Distributed Voicemail</b>.</li> <li>- <b>Embedded Voicemail</b> - Use the voicemail service provided internally by the system itself. This uses the system's System SD card to store messages and prompts.</li> <li>- <b>Group Voicemail</b> - Used with some 3rd-party voicemail services.</li> <li>- <b>Distributed Voicemail</b> - In an SCN network of IP500 V2 systems, only the Voicemail Pro server associated with one IP500 V2 system holds the messages and recording (the centralized voicemail server). However, the other IP500 V2 systems can be associated with their own Voicemail Pro server which handles that systems calls.</li> <li>- <b>Analog Trunk MWI</b> - Use voicemail provided by the analog trunk provider.</li> <li>- <b>Voicemail Pro on UC Module</b> - Use the Voicemail Pro service provided by a UCM module installed in the IP500 V2 control unit. <ul style="list-style-type: none"> <li>• Only select this option is the module is already installed and fully configured. Otherwise, select <b>Voicemail Pro</b>. The settings are automatically changed during the configuration of the UCM module.</li> </ul> </li> </ul> </li> </ul> |
| <b>Voicemail IP Address</b> | <p>Default = Primary Server IP Address</p> <p>The IP address of the server hosting the voicemail service for the IP Office system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Hold Music

This section is used to define the source for the system's default music on hold source. Once the system is installed, additional music on hold sources can be configured for specific groups and incoming call routes

- You must ensure that any MOH source you use complies with copyright, performing rights and other local and national legal requirements.

| Name                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System Source</b>        | <p>Select the source the system should use its default music on hold. The options available depend on the type of system.</p> <ul style="list-style-type: none"> <li><b>WAV File</b> - Use a WAV file called <code>HoldMusic.wav</code>. The file can be uploaded using the controls below. Note that on Linux systems, the file name is case sensitive.</li> <li><b>External</b> - IP500 V2 systems only. Use the audio source connected to the back of the control unit.</li> <li><b>Tone</b> - Use of a repeated double tone generated by the system. This tone is also automatically used if, for any of the .WAV file options the has not yet been successfully uploaded.</li> <li><b>WAV (Restart)</b>: Identical to <b>WAV File</b> above except that for each new listener, the file plays from the beginning. Not supported on IP500 V2 systems.</li> </ul> |
| <b>Select a File Upload</b> | <p>If use of a wav file is selected, use these fields to select and upload the file to the system. The file should be in the following format:</p> <ul style="list-style-type: none"> <li>PCM</li> <li>8kHz 16-bit</li> <li>Mono</li> <li>Maximum length: <ul style="list-style-type: none"> <li>IP500 V2 = 90 seconds.</li> <li>Linux-based Server = 600 seconds.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Auto Attendants

These settings are shown for an IP500 V2 systems with the **Voicemail Type** set to **Embedded Voicemail**. It allows configuration of auto-attendant services. These can then be used as the destination for external calls in incoming call routes.

| Name        | Description                                                                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b> | <p>Range = Up to 12 characters</p> <p>This field sets the name for the auto-attendant service. This can be used to route calls to the auto-attendant.</p> |

## Setup Wizard: Subscription

This panel is only shown for subscription mode systems. It display details of the system's subscription settings and the subscriptions obtained.

The panel is only shown on systems that have completed their initial configuration. The settings cannot be edited. For systems going through initial configuration, the subscription settings are set through the **System** panel.

| Name             | Description                                                                                                                                                                                                                               |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System ID</b> | This is a fixed value against which the system's subscriptions are issued and validated.<br><br><ul style="list-style-type: none"> <li>For an IP500 V2 system, this ID is based on the System SD card installed in the system.</li> </ul> |

## Setup Wizard: Incoming Call Routes

You can use this panel to configure where incoming external calls should be routed.

### Working Hours Time Profile

These settings are used to define a default time profile for the customer's normal hours of business. This profile is then used to alter the routing of incoming calls inside and outside those times.

Once the system has been configured, additional time profiles can be added if required.

| Setting           | Description                                        |
|-------------------|----------------------------------------------------|
| <b>Start Time</b> | The time when normal working hours begin.          |
| <b>End Time</b>   | The time when normal working hours end.            |
| <b>Days</b>       | The days of the week when the working hours apply. |

### Incoming Call Routes

You can create and edit incoming call routes for the lines setup in the previous setup wizard panel. A route is required for each of the incoming line group IDs used for the lines in the system configuration.

| Setting                       | Description                                                                                                                                                                                                                                                                                 |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Incoming Line Group ID</b> | Each of the lines in the system is configured with an Incoming Line Group ID. The same ID can be used for on several line. The incoming call route with the same ID is then used to route calls on those lines.                                                                             |
| <b>Trunk Identifier</b>       | This is a unique name added by the system for the set of trunks                                                                                                                                                                                                                             |
| <b>Incoming Number</b>        | If required, in addition to matching the <b>Incoming Line Group ID</b> you can also match the incoming number received to route the calls for that number to different destinations.<br><br>This option is not supported on all trunks. For example it is not supported with analog trunks. |

|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Directory Overrides Barring</b>                | <p>Default = On.</p> <p>When enabled, the <b>Outgoing Call Bar</b> setting on any user is not applied to the dialing of numbers that are in the system directory. This does not affect other methods of call barring.</p> |
| <b>Bar outgoing calls for Out of Office hours</b> | <p>Default = Off.</p> <p>When enabled, outgoing external calls are barred during times outside the default working hours time profile settings.</p>                                                                       |

**Line Selection for Outgoing Calls**

| Setting                               | Description                                                                                                                                                                                                                                     |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select Line for Outgoing Calls</b> | This field selects the default outgoing line group ID that should be used for all outgoing calls. That outgoing group ID can be assigned to multiple lines. Outgoing calls will then use any available line that has the same outgoing group ID |
| <b>Outgoing Group ID</b>              | <p>These fields show a summary of the existing outgoing group IDs configured and the lines using those settings.</p> <p>To edit the outgoing line groups use the <b>Lines</b> panel.</p>                                                        |
| <b>Line Information</b>               |                                                                                                                                                                                                                                                 |

## Assign Users to Outgoing Route

By default the dialing of external numbers is processed through alternate route selection (ARS) entries in the configuration. These contain setting that control what numbers are allowed, add or remove prefixes, etc.

The default ARS entry is called **Main**. However, the number of additional outgoing call routes exist (**Unrestricted**, **International**, **National** and **Long Distance**). The menu below allows you to select which of these ARS entries should be used by each user.

| Setting               | Description                                                                                                                     |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>           | The user name.                                                                                                                  |
| <b>Outgoing Route</b> | The ARS entry that should be applied to the users outgoing calls. Click on the current setting to select a different ARS entry. |

# Chapter 7: Using User and Extension Templates

You can use templates (XML files) to help speed up the creation of users/extensions with similar settings. The templates that you create and use are stored on the system.

- A range of other configuration records can also be created using templates. However, that is done using the IP Office Manager application rather than web manager.

## Saving a user or extension as a template

You can save the settings of an existing user or extension as a template.

### Procedure

1. From the list of users or extensions, click on the  icon next to the entry you want to save as a template.
2. Click on **Save As Template**.
3. Enter a name for the template file. The file extension **.xml** is added automatically.
4. Click **OK**.
5. If you made any changes to the user or extension before saving them as a template, click **Update**. Otherwise, click **Cancel**.

## Adding a new template

In addition to creating a template from an existing user or extension (see [Saving a user or extension as a template](#) on page 84), you can directly create a new template.

### Procedure

1. Display the list of existing users or extensions.
2. Click **Actions** and then **Template Management**.
3. Click **+ Add**.
4. Enter a name for the template and click **OK**.
5. Edit the settings as required for future entries that will be created using the template.
6. Click **Create**.

## Adding users or extensions using a template

You can use a template to create a new users or extensions.

### Procedure

1. In the user or extension list, click **Actions** and then **Create From Template**.
2. In **Enter number of records**, enter the number of new entries to create.
3. In **Enter starting extension**, enter the extension number for the first new entry. The other new entries will be added sequentially from that number.
4. Use the **Select Template** drop-down to select the template file to use.
5. Click **Preview**. The new entries are listed
  - You can click on an entry in the preview list to edit the key settings that are not part of the template.
  - If necessary, click on the  icon to delete a new entry from the preview list.
  - You can delete multiple entries by selecting their check boxes and then clicking **Delete Selected Records**.
6. Click **Create**.

# Part 2: The Solution Menu

## Solution

This view shows a summary of the server and the main services it is providing. If accessing a primary server, the view includes details of all the servers in the network.

- For IP500 V2 systems, this view is replaced by the same menus used by the initial setup wizard. See [The Setup Wizard/Initial Configuration](#) on page 67.

| Server type                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary Server                     | A single server providing IP Office, Voicemail Pro, one-X <sup>®</sup> Portal for IP Office and various other services.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Secondary Server                   | You can optionally add a secondary server to increase the capacity and provide resilience for the services on the primary.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Expansion Server                   | <p>A Server Edition network can include expansion systems. These provide support for local phones and trunks in other physical locations.</p> <p>The expansion can be another Linux-based server, in which case it supports just IP extensions and trunks. It can also be an IP500 V2 system to add support for non-IP trunks and extensions.</p>                                                                                                                                                                                                                      |
| Application Server                 | <p>The IP Office Application Server is Linux-based server that supports the s. The Application Server supports the Voicemail Pro and one-X Portal for IP Office applications.</p> <ul style="list-style-type: none"><li>• Within a Server Edition network, it can be used to provide one-X Portal for IP Office support for the primary or secondary server, reducing the processing load on that server.</li><li>• It can be used to support a standalone IP500 V2 system, providing Voicemail Pro and one-X Portal for IP Office services for that system.</li></ul> |
| Unified Communication Module (UCM) | The UCM is an embedded server installed into an IP500 V2 system to provide Voicemail Pro and one-X Portal for IP Office services for that system.                                                                                                                                                                                                                                                                                                                                                                                                                      |

# Chapter 8: The "Solution Settings" Menu

## Solution > Solution Settings

This menu is used to access the configuration of optional services that can then be used to support the server or servers being managed.

| Setting                                    | Server Edition | IP500 V2 | Application Server | UCM |
|--------------------------------------------|----------------|----------|--------------------|-----|
| View Scheduled Jobs                        | Yes            | –        | Yes                | Yes |
| Remote Server                              | Yes            | –        | Yes                | Yes |
| Proxy                                      | Yes            | –        | Yes                | Yes |
| User Synchronization Using LDAP            | Yes            | –        | –                  | Yes |
| User Synchronization using Microsoft Teams | Yes            | -        | -                  | Yes |
| Application Server                         | Yes            | –        | –                  | –   |

## View Scheduled Jobs

### Navigation: Solution > Solution Settings > View Scheduled Jobs

This command displays a list of existing scheduled jobs. Existing jobs cannot be edited but they can be selected and deleted if required.

| Field     | Description                                             |
|-----------|---------------------------------------------------------|
| Name      | IP address of the server on which the job is scheduled. |
| Operation | The type of Operation.                                  |

*Table continues...*

| Field            | Description                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Recurring</b> | When <b>Yes</b> is selected, the action will reoccur based on the value in the <b>Frequency</b> field. When <b>No</b> is selected, the action will occur only once.                                                                                                                                                                                                                                                |
| <b>Frequency</b> | Schedule actions to reoccur <b>Daily</b> , <b>Weekly</b> , or <b>Monthly</b> .                                                                                                                                                                                                                                                                                                                                     |
| <b>Day</b>       | The day on which the action occurs. Presentation depends on the <b>Frequency</b> setting. <ul style="list-style-type: none"><li>• When <b>Frequency</b> is set to <b>Daily</b>, the field is disabled.</li><li>• When <b>Frequency</b> is set to <b>Weekly</b>, the range is the days of the week from Monday to Sunday.</li><li>• When <b>Frequency</b> is set to <b>Monthly</b>, the range is 1 to 28.</li></ul> |
| <b>Status</b>    |                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Proxy

### Solution > Solution Settings > Proxy

Selecting **Proxy** from the **Solution Settings** list displays current proxy detail entries. Click the icons beside a record to edit or delete.

Click **Add New Proxy** to create a new proxy.

Configuring proxy details may be required to

- download an ISO file from a remote server
- perform backup and restore actions on a remote server

| Field             | Description                                                                      |
|-------------------|----------------------------------------------------------------------------------|
| <b>Proxy Name</b> | A meaningful name for the proxy. Proxy names can be selected from other windows. |

*Table continues...*

| Field               | Description                                                    |
|---------------------|----------------------------------------------------------------|
| <b>Proxy Server</b> | IP address or Domain name of proxy server.                     |
| <b>Proxy Port</b>   | Port used for the proxy server.                                |
| <b>User Name</b>    | If required, the user name for logging in to the proxy server. |
| <b>Password</b>     | If required, the password for logging in to the proxy server.  |

## User Synchronization Using LDAP

Navigation: **Solution > Solution Settings > User Synchronization Using LDAP**

These menus are provided by the Collaboration service running on Linux-based IP Office servers. For IP500 V2/V2A server, the Collaboration service is provided by an IP Office Application Server or UCM Module. The Collaboration service supported LDAP v3/ LDAPS.

The IP Office system can use LDAP user synchronization to:

- Create new user (and extension) records, update existing user records and delete user records.
- Obtain directory information.
- Perform a combination of the above actions.

This is done by mapping LDAP fields onto IP Office user configuration fields. In addition to this field mapping, for new user creation, a 'user provisioning rule' (UPR) is used to define the extension type and extension template.

The information that can be managed through LDAP synchronization is:

| IP Office User Field          | New | Update | Delete |
|-------------------------------|-----|--------|--------|
| <b>User Identification</b>    | Yes | No     | Yes    |
| <b>Name</b>                   | Yes | Yes    | Yes    |
| <b>Full Name</b>              | Yes | Yes    | Yes    |
| <b>Email</b>                  | Yes | Yes    | Yes    |
| <b>Extensions</b>             | Yes | Yes    | Yes    |
| <b>Login Code</b>             | Yes | No     | No     |
| <b>Voicemail Code</b>         | Yes | No     | No     |
| <b>Mobile Twinning Number</b> | Yes | Yes    | Yes    |
| <b>Group Membership</b>       | Yes | Yes    | Yes    |

*Table continues...*

| User Provisioning Rule | Yes | No | No |
|------------------------|-----|----|----|
|------------------------|-----|----|----|

- Mapping the **User Identification** and **Name** fields is mandatory for all operations. All the other fields are optional.
- Even if mapped, for each particular synchronization operation above, only those field labeled as '**YES**' are used.
- When creating a new user, if both the **Extensions** and **User Provisioning Rule** have been mapped, the extension number setting in the UPR takes priority.
- An LDAP field can be mapped to several IP Office fields. For example, the same LDAP field can be mapped to the user **Name** and **Full Name** fields.
- The LDAP data is not validated during synchronization. When the IP Office configuration is opened in a manual configuration tool, those fields may be flagged as errors until manually corrected. To stop this, the LDAP data should be corrected and resynchronized.

Use this page to map IP Office user fields to LDAP fields.

## User Fields

The following IP Office fields can be mapped.

IP Office user fields are described under **Call Management > Users > Add Users > User**

| Field                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>User Identification</b>    | Mandatory. This field must be unique for each user to be imported into IP Office.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Name</b>                   | Mandatory. The name of the user. User names must be unique across the system. If more than one user has the same name, only the first name must be unique.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Full Name</b>              | Optional. The full name of the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Email</b>                  | Optional. The email address for the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Extensions</b>             | Optional. The extension number of the user, if it is provided in LDAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Login Code</b>             | Optional. The code that has to be entered, as part of a log in sequence, to allow a user to make use of an extension as if it was their own phone. Range = 4 to 15 digits.<br><br>The value can be entered manually or mapped to a directory field. Only numeric values are allowed. if the mapped LDAP field is non-numeric then the field is left blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Voicemail Code</b>         | Optional. A code used by the voicemail server to validate access to a mailbox. Range = 0 to 31 digits.<br><br>The value can be entered manually or mapped to a directory field. Only numeric values are allowed. if the mapped LDAP field is non-numeric then the field is left blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Mobile Twinning Number</b> | Optional. Sets the external destination number for mobile twinned calls.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Group Membership</b>       | Optional. The groups of which the user has been made a member. The directory field must contain the groups in a comma separated list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>User Provisioning Rule</b> | Optional. Provide a user profile rule (UPR) for the users to be imported into IP Office. To create and manage UPRs, see <b>Solution &gt; Solution Settings &gt; User Synchronization Using LDAP &gt; Manage User Provisioning Rules</b> . The name of the directory field providing the UPR must exactly match the name of the UPR created in IP Office.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>System Field</b>           | <ul style="list-style-type: none"> <li>• <b>LAN 1 Address</b> - Optional. Provide the directory field that maps to the IP Office <b>LAN1 IP Address</b> field. If this field is provided, users are created using this IP address.</li> <li>• <b>LAN 2 Address</b> - Optional. Provide the directory field that maps to the IP Office <b>LAN2 IP Address</b> field. If this field is provided, users are created using this IP address.</li> <li>• <b>System Name</b> - Optional. Provide the directory field that maps to IP Office field <b>System Name</b>. If this field is provided, users are created using this IP address.</li> <li>• <b>FQDN</b> - Optional. Provide the directory field that maps to the IP Office field <b>FQDN</b>. If this field is provided, users will be created to this IP address.</li> </ul> |

## Operations in Synchronization

| Field         | Description                                                                                                                                                                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>New</b>    | Use defined settings to create new users.<br><br>When a new user is created in the directory, a new IP Office user is created the next time synchronization occurs.                                                                                                                                                                                          |
| <b>Update</b> | Use defined settings to update existing users.<br><br>When a user is edited in the directory, the IP Office user is edited the next time synchronization occurs.                                                                                                                                                                                             |
| <b>Delete</b> | Use defined settings to delete users.<br><br>When a user is deleted in the directory, the IP Office user is deleted the next time synchronization occurs.<br><br><ul style="list-style-type: none"> <li>If multiple user synchronizations are in use, for example using LDAP and MS-Teams directories, the <b>Delete</b> option is not available.</li> </ul> |

## Schedule Options

| Field                             | Description                                                                                                             |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Use Schedule</b>               | Default = Off                                                                                                           |
| <b>Start Date</b>                 | Default = Blank.<br><br>Click the calendar icon to select a start date.                                                 |
| <b>Start Time</b>                 | Click the arrow to select a start time.                                                                                 |
| <b>Recurring Schedule</b>         | Default = No.<br><br>Setting to Yes displays the configuration options.                                                 |
| <b>Frequency</b>                  | Default = Weekly.<br><br>The options are <b>Daily</b> , <b>Weekly</b> or <b>Monthly</b> .                               |
| <b>Day of Week / Day of Month</b> | Default = Blank.<br><br>Depending on the <b>Frequency</b> setting, select a <b>Day of Week</b> or <b>Day of Month</b> . |

| Field                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Navigation: **Solution > Solution Settings > User Synchronization Using LDAP > View Scheduled Jobs**

| Field               | Description                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Job Name</b>     | A system generated name.                                                                                         |
| <b>Start Time</b>   | The scheduling information for the job based on the settings defined on the <b>Synchronize User Fields</b> page. |
| <b>Recurring</b>    |                                                                                                                  |
| <b>Frequency</b>    |                                                                                                                  |
| <b>Status</b>       | The status can be <b>Scheduled</b> , <b>Running</b> or <b>Completed</b> .                                        |
| <b>Scheduled By</b> | The user name of the user that scheduled the job.                                                                |

The following table provides the user synchronization summary of each job.

| Field                    | Description                                                                                      |
|--------------------------|--------------------------------------------------------------------------------------------------|
| <b>System</b>            | Specifies the user system name.                                                                  |
| <b>Users created</b>     | Specifies the number of users created.                                                           |
| <b>Users failed</b>      | Specifies the number of users failed to synchronize.                                             |
| <b>Users updated</b>     | Specifies the number of user details updated.                                                    |
| <b>Users deleted</b>     | Specifies the number of users deleted from the system.                                           |
| <b>Offline Users</b>     | Specifies the number of offline users in the system.                                             |
| <b>Unknown Mapping</b>   | Specifies the number of user details not synchronized or not mapped.                             |
| Details for sync failure | Specifies the user name.                                                                         |
| <b>User Name</b>         |                                                                                                  |
| <b>Error Description</b> | Describes the type of error occurred.<br>Example: <i>"Extension conflicts with another user"</i> |
| <b>System Name</b>       | Specifies the user system name.                                                                  |

## Manage User Provisioning Rules

Navigation: **Solution > Solution Settings > User Synchronization Using LDAP > Manage User Provisioning Rules**

A user provisioning rule (UPR) is used to apply a set of initial configuration settings when a new user and extension are created by LDAP synchronization. You can create multiple user provisioning rules. The LDAP mapping settings can be used to map a selected user LDAP field to a IP Office UPR in order to define which UPR is used for each new user/extension creation.

The UPR used to create a new user and extension defines the following:

- The IP Office system where the new user and extension are created
- The starting extension number
- The extension template
- The extension type
- The user template

**Note:**

The user provisioning rule cannot be used LDAP synchronization update actions to change the configuration settings of existing users.

| Field                              | Description                                                                                                                                                                                                                                                                       |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>User Provisioning Rule Name</b> | Default = Blank.<br>Enter a descriptive name for the rule.                                                                                                                                                                                                                        |
| <b>IP Office Name</b>              | Default = Blank.<br>Select the IP Office system from the list.                                                                                                                                                                                                                    |
| <b>Start Extension</b>             | Default = Blank.<br>Specify the extension number from which to start. Extensions are created on IP Office in ascending order, skipping any existing used extension numbers. This field is mandatory if either <b>Extension Template</b> or <b>Extension Type</b> fields are used. |
| <b>Select Extension Template</b>   | Default = Blank.<br>Select an extension template from the list. You can define extension templates by selecting <b>Call Management &gt; Extensions &gt; Actions &gt; Template Management</b> .                                                                                    |

## User Synchronization using MS Teams

Navigation: **Solution > Solution Settings > User Synchronization using Microsoft Teams**

Azure Active Directory (Azure AD) is Microsoft's cloud-based identity and access management service, which provides access internal resources, such as apps on your corporate network and intranet, along with any cloud apps developed by your own organization.

The IP Office system can use MS Teams user synchronization to create new user (and extension) records, update existing user records and delete user records. This is done by mapping MS Teams fields onto IP Office user configuration fields. In addition to this field mapping, for new user creation, a 'user provisioning rule' (UPR) is used to define the extension type and extension template.

Azure AD synchronization allows the IP Office telephone number directory to be synchronized with the information on Azure AD. MS Teams synchronization is performed using Web Manager.

## Synchronize User Fields

Navigation: **Solution > Solution Settings > User Synchronization using Microsoft Teams > Synchronize User Fields**

Use this page to map IP Office user fields to MS Teams fields. The following IP Office fields can be mapped.

### User Fields

The following IP Office fields can be mapped.

IP Office user fields are described under **Call Management > Users > Add Users > User**

| Field                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>User Identification</b>    | Mandatory. This field must be unique for each user to be imported into IP Office.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Name</b>                   | Mandatory. The name of the user. User names must be unique across the system. If more than one user has the same name, only the first name must be unique.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Full Name</b>              | Optional. The full name of the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Email</b>                  | Optional. The email address for the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Extensions</b>             | Optional. The extension number of the user, if it is provided in LDAP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Login Code</b>             | Optional. The code that has to be entered, as part of a log in sequence, to allow a user to make use of an extension as if it was their own phone. Range = 4 to 15 digits.<br><br>The value can be entered manually or mapped to a directory field. Only numeric values are allowed. if the mapped LDAP field is non-numeric then the field is left blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Voicemail Code</b>         | Optional. A code used by the voicemail server to validate access to a mailbox. Range = 0 to 31 digits.<br><br>The value can be entered manually or mapped to a directory field. Only numeric values are allowed. if the mapped LDAP field is non-numeric then the field is left blank.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Mobile Twinning Number</b> | Optional. Sets the external destination number for mobile twinned calls.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Group Membership</b>       | Optional. The groups of which the user has been made a member. The directory field must contain the groups in a comma separated list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>User Provisioning Rule</b> | Optional. Provide a user profile rule (UPR) for the users to be imported into IP Office. To create and manage UPRs, see <b>Solution &gt; Solution Settings &gt; User Synchronization Using LDAP &gt; Manage User Provisioning Rules</b> . The name of the directory field providing the UPR must exactly match the name of the UPR created in IP Office.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>System Field</b>           | <ul style="list-style-type: none"> <li>• <b>LAN 1 Address</b> - Optional. Provide the directory field that maps to the IP Office LAN1 <b>IP Address</b> field. If this field is provided, users are created using this IP address.</li> <li>• <b>LAN 2 Address</b> - Optional. Provide the directory field that maps to the IP Office LAN2 <b>IP Address</b> field. If this field is provided, users are created using this IP address.</li> <li>• <b>System Name</b> - Optional. Provide the directory field that maps to IP Office field <b>System Name</b>. If this field is provided, users are created using this IP address.</li> <li>• <b>FQDN</b> - Optional. Provide the directory field that maps to the IP Office field <b>FQDN</b>. If this field is provided, users will be created to this IP address.</li> </ul> |

## Operations in Synchronization

| Field         | Description                                                                                                                                                                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>New</b>    | Use defined settings to create new users.<br><br>When a new user is created in the directory, a new IP Office user is created the next time synchronization occurs.                                                                                                                                                                                          |
| <b>Update</b> | Use defined settings to update existing users.<br><br>When a user is edited in the directory, the IP Office user is edited the next time synchronization occurs.                                                                                                                                                                                             |
| <b>Delete</b> | Use defined settings to delete users.<br><br>When a user is deleted in the directory, the IP Office user is deleted the next time synchronization occurs.<br><br><ul style="list-style-type: none"> <li>If multiple user synchronizations are in use, for example using LDAP and MS-Teams directories, the <b>Delete</b> option is not available.</li> </ul> |

## Schedule Options

| Field                             | Description                                                                                                         |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Use Schedule</b>               | Default = Off                                                                                                       |
| <b>Start Date</b>                 | Default = Blank.<br>Click the calendar icon to select a start date.                                                 |
| <b>Start Time</b>                 | Click the arrow to select a start time.                                                                             |
| <b>Recurring Schedule</b>         | Default = No.<br>Setting to Yes displays the configuration options.                                                 |
| <b>Frequency</b>                  | Default = Weekly.<br>The options are <b>Daily</b> , <b>Weekly</b> or <b>Monthly</b> .                               |
| <b>Day of Week / Day of Month</b> | Default = Blank.<br>Depending on the <b>Frequency</b> setting, select a <b>Day of Week</b> or <b>Day of Month</b> . |

| Field                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Preview Results</b> | Display a preview of the synchronization results based on the current settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Synchronize</b>     | Click to start the synchronization operation.<br><br> <b>Important:</b> <ul style="list-style-type: none"> <li>In order to perform the synchronization operation, you must set the current user for background configuration synchronization tasks. If this was not done when logging on to Web Manager, go to <b>Menu Bar Current User Icon &gt; Preferences</b> and set <b>Set current user for configuration synchronization</b> to <b>YES</b>.</li> </ul> |

## Manage User Provisioning Rules

Navigation: **Solution > Solution Settings > User Synchronization using Microsoft Teams > Manage User Provisioning Rules**

A user provisioning rule (UPR) is used to apply a set of initial configuration settings when a new user and extension are created by MS Teams synchronization. You can create multiple user provisioning rules. The MS Teams mapping settings can be used to map a selected user MS Teams field to a IP Office UPR in order to define which UPR is used for each new user/extension creation.

The UPR used to create a new user and extension defines the following:

- The IP Office system where the new user and extension are created
- The starting extension number
- The extension template
- The extension type
- The user template

 **Note:**

The user provisioning rule cannot be used MS Teams synchronization update actions to change the configuration settings of existing users.

| Field                              | Description                                                                                                                                                                                                                                                                       |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>User Provisioning Rule Name</b> | Default = Blank.<br>Enter a descriptive name for the rule.                                                                                                                                                                                                                        |
| <b>IP Office Name</b>              | Default = Blank.<br>Select the IP Office system from the list.                                                                                                                                                                                                                    |
| <b>Start Extension</b>             | Default = Blank.<br>Specify the extension number from which to start. Extensions are created on IP Office in ascending order, skipping any existing used extension numbers. This field is mandatory if either <b>Extension Template</b> or <b>Extension Type</b> fields are used. |
| <b>Select Extension Template</b>   | Default = Blank.<br>Select an extension template from the list. You can define extension templates by selecting <b>Call Management &gt; Extensions &gt; Actions &gt; Template Management</b> .                                                                                    |
| <b>Extension Type</b>              | Default = Blank.<br>The options are: <ul style="list-style-type: none"> <li>• <b>H323 Extension</b></li> <li>• <b>IP DECT Extension</b></li> <li>• <b>SIP DECT Extension</b></li> <li>• <b>SIP Extension</b></li> </ul>                                                           |
| <b>Select User Template</b>        | Default = Blank.<br>Select a user template from the list. You can define user templates by selecting <b>Call Management &gt; Users &gt; Actions &gt; Template Management</b> .                                                                                                    |

## Backup

### Navigation:

- **Solution > Actions > Backup**
- **Solution > ☰ > Backup**

The backup menu allows you to backup a server or servers to another server. That other server is defined by configuring a remote server entry that is then used as the backup destination.

During the configuration of the backup, you can select what settings are backed up and whether to perform an immediate backup, scheduled backup or repeating scheduled backup.

For full details of backup and restore, see [Backup and Restore](#) on page 642.

### ! Security alert:

Backup and restore actions to a remote server using HTTP/HTTPS must only be performed using servers inside a secure, trusted network. HTTP and HTTPS can only be used to connect to an IP Office server. HTTP/HTTPS backup to a non-IP Office server is not supported.

### \* Note:

When managing a Server Edition solution with Web Manager, it must be managed from the Primary Server if the Primary Server is active. If the Primary Server is not active, you can perform management tasks from the Secondary Server, but not upgrade or backup and restore.

### Related links

[The "Actions" Button Menu](#) on page 107

---

## Restore

### Navigation:

- **Solution > Actions > Restore**
- **Solution > ☰ > Restore**

This option is used to restore a previous backup made using the **Backup** command. During the restore process, you can select which parts of the previous backup should be restored.

For full details of backup and restore, see [Backup and Restore](#) on page 642.

### ! Security alert:

Backup and restore actions to a remote server using HTTP/HTTPS must only be performed using servers inside a secure, trusted network. HTTP and HTTPS can only be used to connect to an IP Office server. HTTP/HTTPS backup to a non-IP Office server is not supported.

 **Note:**

When managing a Server Edition solution with Web Manager, it must be managed from the Primary Server if the Primary Server is active. If the Primary Server is not active, you can perform management tasks from the Secondary Server, but not upgrade or backup and restore.

[The "Actions" Button Menu](#) on page 107

---

## Transfer ISO

**Navigation:** **Solution > Actions > Transfer ISO**

The first stage of upgrades Linux-based IP Office system is to transfer an ISO file of the new software using this command. For details of upgrading, refer to *Deploying IP Office Server Edition*.

**Related links**

[The "Actions" Button Menu](#) on page 107

---

## Upgrade

**Navigation:** **Solution > Actions > Upgrade**

Having transferred an ISO file containing new software to the system, the message "Upgrade Available" is shown to each server in the **Solution** menu. Selecting those servers and then **Upgrade** can be used to start the upgrade process.

For details of upgrading, refer to *Deploying IP Office Server Edition*.

 **Warning:**

- Before performing any upgrade, you must:
  - take a backup of the servers.
  - read all release notes and documentation relating to the new software and any other intermediate releases.
- When managing a Server Edition solution with Web Manager, it must be managed from the Primary Server if the Primary Server is active. If the Primary Server is not active, you can perform management tasks from the Secondary Server, but not upgrade or backup and restore.
- When upgrading multiple servers, the primary server must be upgraded first. Once upgraded, the remaining servers can be upgraded as a group.

# Synchronize Service User and System Password

**Solution > Actions > Synchronize Service User and System Password**

## Note:

This option is not available on IP500 V2 systems.

Synchronizing the service user and system password enables single sign on for all systems and applications across the solution.

- This process synchronizes the security service users and their service user passwords on all systems.
- This process only affects service users and their passwords. It does not affect any other security settings, including the settings of rights groups.

Performing a security settings reset from Manager or Web Manager will disable single sign on since there is no longer a common user with common credentials. In this case, reset the password of the common user to the common value. To synchronize the password, select the Primary Server and one or more additional systems on the Solution page and then select **Actions > Synchronize Service User and System Password**.

If the password on one or more systems is not synchronized, the Provide Credentials window opens. In this window, you can enter the common credentials for the service user on each system that is not currently synchronized.

# Synchronize Single Sign-On Configuration

**Navigation: Solution > Actions > Synchronize Single Sign-On configuration**

Synchronize the **Enable Avaya Cloud Account Authorization** and **Token Cache Time** settings on all the selected servers, using the values from the primary server.

- This action requires the IP Office service user account using IP Office Web Manager to have sufficient rights and to be shared on all the IP Office servers.

## Related links

[The "Actions" Button Menu](#) on page 107

---

## Synchronize APNS configuration

**Navigation:** Solution > Actions > Synchronize APNS configuration

Synchronize the **Enable Apple Push Notification** setting on all the selected servers, using the value from the primary server.

- This action requires the IP Office service user account using IP Office Web Manager to have sufficient rights and to be shared on all the IP Office servers.

### Related links

[The "Actions" Button Menu](#) on page 107

---

## Synchronize APNP System-ID

**Navigation:** Solution > Actions > Synchronize APNP System-ID

Synchronize the **System-ID**, **Avaya Spaces API Key** and **Avaya Spaces Key Secret** settings on all the selected servers, using the values from the primary server.

- The **System-ID** is a hidden value generated by an IP Office when the **Enable Apple Push Notification** setting is enabled.
- This action requires the IP Office service user account using IP Office Web Manager to have sufficient rights and to be shared on all the IP Office servers.

### Related links

[The "Actions" Button Menu](#) on page 107

---

## Download Configuration

**Navigation:** Solution > Actions > Download Configuration

Selecting Download Configuration saves a .zip file containing the configuration file to the local machine running Web Manager. The location depends upon your browser settings.

For a deployment with multiple systems, the zip file contains one .cfg file for each server in the network plus a single .cfi file for the whole network.

# Chapter 10: The "Actions" Button Menu (IP500 V2)

## Solution > Actions

This table lists the actions available when managing a standalone IP500 V2 server. For other types of server, see [The "Actions" Button Menu](#) on page 107.

| Command                |                         | IP500 V2           |
|------------------------|-------------------------|--------------------|
| Backup                 |                         | Yes <sup>[1]</sup> |
| Restore                |                         | Yes <sup>[1]</sup> |
| Upgrade                |                         | Yes <sup>[1]</sup> |
| Upload Configuration   |                         | Yes                |
| Download Configuration |                         | Yes                |
| Backup Status          |                         | Yes                |
| Restore Status         |                         | Yes                |
| On-boarding            |                         | Yes                |
| Initial Configuration  |                         | Yes                |
| Service Commands       | Reboot                  | Yes                |
|                        | System Shutdown         | Yes                |
|                        | Erase Security Settings | Yes                |
|                        | Service Status          | Yes                |
|                        | Erase Configuration     | Yes                |
|                        | Memory Card Start       | Yes                |
|                        | Memory Card Stop        | Yes                |
|                        | Copy to Optional SD     | Yes                |

1. No longer supported by current web browsers.

[Service Commands \(Standalone IP500 V2\)](#) on page 117

---

## Backup

### **Solution > Actions > Backup**

This command can be used to start one of 2 different types of backup:

- **On Device** - Copy the contents of the System SD card's `/primary` folder to its `/backup` folder.
- **Client Machine** - Copy the contents of the System SD card's `/backup` folder to a location specified on the PC running web manager.

 **Note:**

- This option is not supported by current browsers. The option is not available in later versions of IP Office Web Manager.

This action requires the IP Office service user account using IP Office Web Manager to have sufficient rights and to be shared on all the IP Office servers.

Note that these processes take approximately 25 minutes. The progress can be checked using the **Solution > Actions > Backup Status** command.

### **Related links**

[The "Actions" Button Menu \(IP500 V2\)](#) on page 113

---

## Restore

### **Solution > Actions > Restore** (Standalone IP500 V2)

This process restores a previous backup taken using web manager. This command can be used to start one of 2 different types of restore operation:

- **On Device** - Copy the contents of the System SD card's `/backup` folder to the `/primary` folder.
- **Client Machine** - Copy the contents of the previous backup to the System SD card's `/backup` folder.

 **Note:**

- This option is not supported by current browsers. The option is not available in later versions of IP Office Web Manager.

This action requires the IP Office service user account using IP Office Web Manager to have sufficient rights and to be shared on all the IP Office servers.

 **Warning:**

- The processes requires the IP Office system to reboot in order to apply any changes made. The reboot ends all current calls and services.

Note that these processes take approximately 25 minutes. The progress can be checked using the **Solution > Actions > Backup Status** command.

## Download Configuration

- **Solution > Actions > Download Configuration** (Standalone IP500 V2)
- **Solution > ≡ > Download Configuration** (Other servers)

This commands allows you to download a copy of the configuration of the IP Office service being run by the server. This configuration may be requested to resolve support requests.

**Related links**

[The "Actions" Button Menu \(IP500 V2\)](#) on page 113

---

## Upload Configuration

**Solution > Actions > Upload Configuration** (Standalone IP500 V2)

This command allows an IP Office configuration file to be uploaded to the server.

- Download a copy of the system's existing configuration before performing this action.
- You must ensure that the configuration matches the physical configuration of the system and its operating mode.
- This action will cause the system to reboot, ending all current calls and services.

## On-boarding

- **Solution > Actions > On-boarding** (Standalone IP500 V2)
- **Solution > ☰ > On-boarding** (Other servers)

On-boarding refers to the configuration of an SSL VPN service in order to enable remote management services to customers, such as fault management, monitoring, and administration.

 **Warning:**

The process of 'on-boarding' automatically creates an SSL VPN service in the system configuration when the on-boarding file is uploaded to the system. Care should be taken not to delete or modify such a service except when advised to by Avaya.

| Field                          | Descriptions                                                                                                                                                                                                                                                                              |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>TAA series hardware</b>     | Set to <b>On</b> if your catalog description ends with the letters "TAA". For example: IP OFFICE 500 VERSION 2 CONTROL UNIT TAA. This assists in creating an accurate install base record. If you are unsure whether the catalog description ends in TAA or not, leave this box unmarked. |
| <b>Get Inventory File</b>      | When you configure the SSL VPN service on a new system, you must begin by generating an inventory of the IP Office system.                                                                                                                                                                |
| <b>Register IP Office</b>      | Opens a browser window for the GRT web site. You are prompted for a user ID and password. On the GRT web site, enter the required data for the IP Office system.                                                                                                                          |
| <b>Upload On-boarding file</b> | The inventory file that you generated is uploaded to the GRT and the inventory data is populated in the Avaya Customer Support (ACS) database.                                                                                                                                            |

**Related links**

[The "Actions" Button Menu \(IP500 V2\)](#) on page 113

---

## Initial Configuration

- **Solution > Actions > Initial Configuration** (Standalone IP500 V2)
- **Navigation:Solution > ≡ > Initial Configuration** (Other servers)

This command reruns the initial configuration process that was previously run during the initial deployment of the server. See [The Setup Wizard/Initial Configuration](#) on page 67.

Note that re-running the initial configuration does not allow the **System Mode** to be changed. For example it cannot be used to change a subscription mode system to a non-subscription mode.

[The "Actions" Button Menu \(IP500 V2\)](#) on page 113

---

## Service Commands (Standalone IP500 V2)

**Solution > Actions > Service Commands**

The following are the service commands supported for standalone IP500 V2 servers. For other types of server, see [Service Commands](#) on page 131.

| Command                 | IP500 V2 |
|-------------------------|----------|
| Reboot                  | Yes      |
| System Shutdown         | Yes      |
| Erase Security Settings | Yes      |
| Service Status          | Yes      |
| Erase Configuration     | Yes      |
| Memory Card Start       | Yes      |
| Memory Card Stop        | Yes      |
| Copy to Optional SD     | Yes      |

### Related links

## Reboot

- **Solution > Actions > Service Commands > Reboot** (Standalone IP500 V2)
- **Solution > ≡ > Service Commands > Restart IP Office Service** (Other servers)

This commands restarts the IP Office service:

- For IP500 V2 servers, it physically reboots the server and any attached expansion modules.
- For other servers, it restarts the IP Office service being run on the server.

When this command is selected, the **Reboot** window opens. When the reboot occurs can be selected as follows:

- **Immediate** Send the configuration and then reboot the system.
- **Free** Send the configuration and reboot the system when there are no calls in progress.
- **Timed** The same as **When Free** but waits for a specific time after which it then waits for there to be no calls in progress. The time is specified by selecting a time from the drop down list.

### Related links

[Service Commands \(Standalone IP500 V2\)](#) on page 117

## System Shutdown (IP500 V2)

- **Solution > Actions > Service Commands > System Shutdown**
- For other servers, use the shutdown command in the **Platform View** menus. See [The Platform View menus](#) on page 134.

This command can be used to shutdown IP500 V2 systems. The shut down can be either indefinite or for a set period of time after which the system will reboot. For Linux based systems, use the service commands in IP Office Web Manager

### **Warning:**

- A shutdown must always be used to switch off the system. Simply removing the power cord or switching off the power input may cause the loss of configuration data.
- This is not a polite shutdown, any user calls and services in operation will be stopped. Once shutdown, the system cannot be used to make or receive any calls until restarted.

The shutdown process takes up to a minute to complete. When shutting down a system with a Unified Communications Module installed, the shutdown can take up to 3 minutes while the module safely closes all open files and closes down its operating system. During this period the module's LED 1 remains green.

- LED1 on each IP500 base card installed will also flash red rapidly plus LED 9 if a trunk daughter card is fitted to the base card.
- The CPU LED on the rear of the system will flash red rapidly.
- The System SD and Optional SD memory card LEDs on the rear of the system are extinguished.

To restart a system when shutdown indefinitely, or to restart a system before the timed restart, switch power to the system off and on again.

Once you have selected the system from the Select IP Office window, the System Shutdown Mode window opens. Select the type of shutdown required:

- If a **Timed** shutdown is selected, the system will reboot after the set time has elapsed.
- If **Indefinite** is used, the system can only be restarted by having its power switched off and then on again. For Linux based telephone systems, the telephony service must be restarted through the server's web control pages.

## Erase Security Settings (IP500 V2)

- **Solution > Actions > Service Commands > Erase Security Settings** (Standalone IP500 V2)
- **Solution > ≡ > Service Commands > Erase Security Settings** (Other servers)

The **Erase Security Settings** command returns the security settings of a system back to their default values. This action does not affect the system's configuration or audit trail record.

Note that any security certificates stored and being used by the system are deleted. Any services currently using those certificates are disconnected and disabled until the appropriate certificates

are added back to the system's security configuration. That includes SSL VPN connections being used to perform system maintenance.

For IP500 and IP500 V2 control units, if the security settings cannot be defaulted using this command, they can be defaulted using a DTE cable connection to the system. Refer to *Deploying an IP500 V2 IP Office Subscription System*.

 **Warning:**

- Whilst defaulting the security settings does not require a system reboot, it may cause service disruption for several minutes while the system generates a new default security certificate.

[Service Commands \(Standalone IP500 V2\)](#) on page 117

## Service Status

**Solution > Actions > Service Commands > Service Status** (Standalone IP500 V2)

This command can be used to disable the server's telephony services if required. While disabled:

- All telephony services are stopped.
- Avaya 9600 Series and J100 Series telephones display "System Unlicensed".

[Service Commands \(Standalone IP500 V2\)](#) on page 117

## Memory Card Start

**Solution > Actions > Service Commands > Memory Card Start** (Standalone IP500 V2)

The operation of the memory card is automatically restarted when it is physically inserted into the server or the server is restarted. However, this command can be used to restart operation of a memory card that has been shut down but not removed.

**Related links**

[Service Commands \(Standalone IP500 V2\)](#) on page 117

## Memory Card Stop

**Solution > Actions > Service Commands > Memory Card Stop** (Standalone IP500 V2)

This command can be used to shutdown the operation of IP500 V2 unit memory cards.

This action or a system shutdown must be performed before a memory card is removed from the unit. Removing a memory card while the system is running may cause file corruption. Card services can be restarted by either reinserting the card or using the **Memory Card Start** command.

Shutting down the memory card will disable all services provided by the card including Embedded Voicemail if being used. Features licensed by the memory card will continue to operate for up to 2 hours.

[Service Commands \(Standalone IP500 V2\)](#) on page 117

## Copy to Optional SD

**Solution > Actions > Service Commands > Copy to Optional SD** (Standalone IP500 V2)

This process copies all files on the System SD card to the Optional SD card if present. It includes the `/primary` and `/backup` folders and the Embedded Voicemail files including message files. Any matching files and folders on the Optional SD card are overwritten.

The process is a simple copy. Any files already copied that change while the process are not recopied. Any new files added while the process is running, for example voicemail messages, may not be copied.

This process takes at least 90 minutes and may take much longer depending on the amount of data to be copied, for example it will be longer if Embedded Voicemail is being used by the IP Office system to take messages.

## Add System to Solution

### Navigation: Solution > Configure > Add System to Solution

Perform the following steps to add a system to a IP Office Server Edition Solution. When you add a system, an IP Office Lines connecting it to the primary, and if present secondary, are automatically added to the server configurations.

**! Important:**

If the Manager setting **File > Preferences > Preferences > SE Central Access** is set to **On**, an IP Office Line is not configured from the new system to the Server Edition Primary Server. The status of the new system is **Offline**. You must configure an IP Office Line from the new system to the Server Edition Primary Server.

1. Select **Solution > Configure > Add System to Solution**.
2. Depending on the system type, select **Secondary server** or **Expansion System**.
3. Perform one of the following:

Adding an offline or inaccessible system:

- a. Click the check box **Offline or Inaccessible System**
- b. In the **IP Address of the system to Add** field, enter the IP address of the system.
- c. Enter and confirm a **Websocket Password**. The password must have a minimum of eight characters.
- d. Click **Next**.

Discover a system:

- a. Click **Discover**.
- b. Select a system from the discovered list.
- c. Enter and confirm a **Websocket Password**. The password must have a minimum of eight characters.
- d. Click **Next**.

You can change the system discovery settings by clicking **Discover** or **Discovery Preferences**. The Discovery Preferences window contains the following fields.

| Field                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>HTTP Discovery</b>       | Controls whether HTTP is used to discover systems.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>IP Address Range</b>     | <ul style="list-style-type: none"> <li>Address ranges can be specified using dashes, for example 135.64.180.170 - 135.64.180.175.</li> <li>Multiple ranges can be entered separated by commas, for example 10.133.39.1-10.133.39.115, 148.147.214.40-148.147.214.254</li> </ul> <p> <b>Note:</b><br/>Only IP Office systems running release 9.1.x or higher will be discovered.</p> |
| <b>UDP Discovery</b>        | Controls whether Manager uses UDP to discover systems.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Broadcast IP Address</b> | The broadcast IP address range used during UDP discovery. Since UDP broadcast is not routable, it will not locate systems that are on different subnets.                                                                                                                                                                                                                                                                                                               |

## Link Expansions

**Navigation: Solution > Configure > Link Expansions**

Normally IP Office lines linking the systems in a network to the primary and, if present, secondary servers are automatically added when during the initial configuration of a new server.

For Select and subscription systems, it is also possible to add links between expansion systems. That is done using this command. When selected, the following menu options are available.

|                                |                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>First Expansion System</b>  | Use these fields to select the two expansion systems for which you want links added to each systems configuration.                                                                                                                                                                                                                                                                                |
| <b>Second Expansion System</b> |                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Select Link Type</b>        | <p>Default = SCN Websocket (Secure)</p> <p>Select the security level for the line. The options are:</p> <ul style="list-style-type: none"> <li>• <b>SCN Websocket (Secure)</b>: Recommended for security and NAT traversal.</li> <li>• <b>SCN Websocket</b>: Supports NAT traversal with limited security.</li> <li>• <b>SCN</b>: Legacy SCN line. Not recommended for new deployment.</li> </ul> |
| <b>Password</b>                | <p>If the <b>Link Type</b> is set to <b>SCN Websocket (Secure)</b> or <b>SCN Websocket</b>, you must configure a password.</p> <p>The password must have a minimum of eight characters.</p>                                                                                                                                                                                                       |
| <b>Confirm Password</b>        |                                                                                                                                                                                                                                                                                                                                                                                                   |

## Dashboard

**Navigation:** Solution > ≡ > Dashboard

The **Dashboard** is a read only detailed inventory of the server. The following information is displayed:

- Control Unit type
- Hardware Installed
- System Information
- Feature Configured
- Licenses Installed
- Users by Profile
- Available Extensions
- Available Groups

Clicking a link brings you to the main page for the record type.

## Backup

**Navigation:**

- Solution > Actions > Backup
- Solution > ≡ > Backup

The backup menu allows you to backup a server or servers to another server. That other server is defined by configuring a remote server entry that is then used as the backup destination.

During the configuration of the backup, you can select what settings are backed up and whether to perform an immediate backup, scheduled backup or repeating scheduled backup.

For full details of backup and restore, see [Backup and Restore](#) on page 642.

 **Security alert:**

Backup and restore actions to a remote server using HTTP/HTTPS must only be performed using servers inside a secure, trusted network. HTTP and HTTPS can only be used to connect to an IP Office server. HTTP/HTTPS backup to a non-IP Office server is not supported.

 **Note:**

When managing a Server Edition solution with Web Manager, it must be managed from the Primary Server if the Primary Server is active. If the Primary Server is not active, you can perform management tasks from the Secondary Server, but not upgrade or backup and restore.

## Restore

### Navigation:

- **Solution > Actions > Restore**
- **Solution > ≡ > Restore**

This option is used to restore a previous backup made using the **Backup** command. During the restore process, you can select which parts of the previous backup should be restored.

For full details of backup and restore, see [Backup and Restore](#) on page 642.

 **Security alert:**

Backup and restore actions to a remote server using HTTP/HTTPS must only be performed using servers inside a secure, trusted network. HTTP and HTTPS can only be used to connect to an IP Office server. HTTP/HTTPS backup to a non-IP Office server is not supported.

 **Note:**

When managing a Server Edition solution with Web Manager, it must be managed from the Primary Server if the Primary Server is active. If the Primary Server is not active, you can perform management tasks from the Secondary Server, but not upgrade or backup and restore.

## On-boarding

- **Solution > Actions > On-boarding** (Standalone IP500 V2)
- **Solution > ≡ > On-boarding** (Other servers)

On-boarding refers to the configuration of an SSL VPN service in order to enable remote management services to customers, such as fault management, monitoring, and administration.

 **Warning:**

The process of 'on-boarding' automatically creates an SSL VPN service in the system configuration when the on-boarding file is uploaded to the system. Care should be taken not to delete or modify such a service except when advised to by Avaya.

| Field                          | Descriptions                                                                                                                                                                                                                                                                              |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>TAA series hardware</b>     | Set to <b>On</b> if your catalog description ends with the letters "TAA". For example: IP OFFICE 500 VERSION 2 CONTROL UNIT TAA. This assists in creating an accurate install base record. If you are unsure whether the catalog description ends in TAA or not, leave this box unmarked. |
| <b>Get Inventory File</b>      | When you configure the SSL VPN service on a new system, you must begin by generating an inventory of the IP Office system.                                                                                                                                                                |
| <b>Register IP Office</b>      | Opens a browser window for the GRT web site. You are prompted for a user ID and password. On the GRT web site, enter the required data for the IP Office system.                                                                                                                          |
| <b>Upload On-boarding file</b> | The inventory file that you generated is uploaded to the GRT and the inventory data is populated in the Avaya Customer Support (ACS) database.                                                                                                                                            |

## Launch SSA

### Navigation: **Solution > ≡ > Launch SSA**

The System Status Application is a diagnostic tool for system managers and administrators and is used to monitor and check the status of systems. Select **Launch SSA** from the menu for a server to check the status of that server.

For more information, refer to *Using IP Office System Status*.

 **Note:**

- This option is not supported by current browsers. The option is not available in later versions of IP Office Web Manager.

This action requires the IP Office service user account using IP Office Web Manager to have sufficient rights and to be shared on all the IP Office servers.

[Erase Configuration](#) on page 132

[Erase Security Settings](#) on page 132

## Restart IP Office Service

- **Solution > Actions > Service Commands > Reboot** (Standalone IP500 V2)
- **Solution > ≡ > Service Commands > Restart IP Office Service** (Other servers)

This commands restarts the IP Office service:

- For IP500 V2 servers, it physically reboots the server and any attached expansion modules.
- For other servers, it restarts the IP Office service being run on the server.

When this command is selected, the **Reboot** window opens. When the reboot occurs can be selected as follows:

- **Immediate** Send the configuration and then reboot the system.
- **Free** Send the configuration and reboot the system when there are no calls in progress.
- **Timed** The same as **When Free** but waits for a specific time after which it then waits for there to be no calls in progress. The time is specified by selecting a time from the drop down list.

[Service Commands](#) on page 131

## Erase Configuration

- **Solution > Actions > Service Commands > Erase Configuration** (Standalone IP500 V2)
- **Navigation:Solution > ≡ > Service Commands > Erase Configuration** (Other servers)

The **Erase Configuration** command returns the configuration settings of the IP Office service back to their default values. It does not affect the system's security settings or audit trail record.

### Related links

[Service Commands](#) on page 131

## Erase Security Settings

- **Solution > Actions > Service Commands > Erase Security Settings** (Standalone IP500 V2)
- **Solution > ≡ > Service Commands > Erase Security Settings** (Other servers)

The **Erase Security Settings** command returns the security settings of a system back to their default values. This action does not affect the system's configuration or audit trail record.

Note that any security certificates stored and being used by the system are deleted. Any services currently using those certificates are disconnected and disabled until the appropriate certificates are added back to the system's security configuration. That includes SSL VPN connections being used to perform system maintenance.

For IP500 and IP500 V2 control units, if the security settings cannot be defaulted using this command, they can be defaulted using a DTE cable connection to the system. Refer to *Deploying an IP500 V2 IP Office Subscription System*.

### Warning:

- Whilst defaulting the security settings does not require a system reboot, it may cause service disruption for several minutes while the system generates a new default security certificate.

## Initial Configuration

- **Solution > Actions > Initial Configuration** (Standalone IP500 V2)
- **Navigation:Solution > ≡ > Initial Configuration** (Other servers)

This command reruns the initial configuration process that was previously run during the initial deployment of the server. See [The Setup Wizard/Initial Configuration](#) on page 67.

Note that re-running the initial configuration does not allow the **System Mode** to be changed. For example it cannot be used to change a subscription mode system to a non-subscription mode.

# Chapter 13: The Platform View menus

**Navigation:** Solution > ≡ > Platform View

The **Platform View** menus are used to configure a range of settings that underlay the operation of Linux-based IP Office servers. For example, setting the date and time settings of the server.

In addition to access through IP Office Web Manager, these menus can be accessed directly using the server address and port 7071.

 **Note:**

This option is not available on IP500 V2 systems.

The following are the **Platform View** menus.

| Menus            | Description                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>    | This menu gives an overview of the status of the applications hosted on the IP Office server.                                                                                                                                                                                                                                                                                                                                             |
| <b>Logs</b>      | This menu has sub-menus for viewing and managing log records and log files. <ul style="list-style-type: none"><li>• <b>Debug Logs</b> - View the current log files for the server and the application services hosted by the server.</li><li>• <b>Syslog Event Viewer</b> - View Syslog log records received or generated by the server.</li><li>• <b>Download</b> - Create and download archive files of existing log records.</li></ul> |
| <b>Updates</b>   | Display the versions of applications and components installed and the alternate versions available.                                                                                                                                                                                                                                                                                                                                       |
| <b>Settings</b>  | This menu has sub-menus for various areas of server configuration and operation. <ul style="list-style-type: none"><li>• <b>General</b> - General server settings such as the locations of software update repositories.</li><li>• <b>System</b> - View and manage the server setting for date, time and IP address details.</li></ul>                                                                                                    |
| <b>AppCenter</b> | You can download the installation packages for applications such as the Voicemail Pro client application from this page.                                                                                                                                                                                                                                                                                                                  |

## System

Navigation: **Solution** >  > **Platform View** > **System**

The **System** menu provides an overview of the server status including the status of the application services running on the server.

The main content pane contains two sections: **Services** and **System**.

### Services

This table lists the services supported by the server. In addition to showing the status of the service, it also contains buttons to start or stop each service. Click on the link for **Mem/CPU usage** usage will display a summary graph of CPU and memory usage by the application.

The services available depending on the type of server.

| Application                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

It changes to green when the portal server is active.</li> <li>If portal resiliency is not configured, the portal service on the Server Edition Secondary server is automatically stopped and cannot be manually started.</li> </ul> |
| <b>Voicemail</b>                        | This is the voicemail service for Voicemail Pro.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Collaboration Services</b>           | This service handles support for connections between IP Office systems and services such as LDAP v3 or MS Teams.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Web License Manager</b>              | This service allows the server to act as a WebLM server. IP Office systems can then use the WebLM service to host, validate and distribute licenses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Web Manager</b>                      | This is a browser-based application that you can configure and manage the IP Office server. For servers that are part of an IP Office Server Edition or Select network, the menus for all servers in the network are aggregated into one set of menus.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

*Table continues...*

| Application                                                                                                                                                                                                               | Description                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Optional services</b><br>The server can include a number of additional services. Click <b>Show optional services</b> to display those services. These services are not supported on the Unified Communications Module. |                                                                                                                                                                                                                                                                                                               |
| <b>Local Media Manager</b>                                                                                                                                                                                                | This service is used to provide the local Media Manager. It is not required for centralized Media Manager.<br><br>Media Manager is used for the long term storage and retrieval of call recordings. The recordings are still made by Voicemail Pro, but are then collected and stored by Media Manager.       |
| <b>WebRTC Gateway</b>                                                                                                                                                                                                     | This service is used for WebRTC connection to the system through Avaya one-X <sup>®</sup> Portal for IP Office. For example, for WebRTC from Space Calling and Avaya one-X <sup>®</sup> Portal for IP Office Chrome browser clients.<br><br>It is not used for WebRTC from IP Office User Portal clients.     |
| <b>Web Client</b>                                                                                                                                                                                                         | This service allows users to use the Avaya IP Office Web Client for WebRTC softphone connections to Avaya one-X <sup>®</sup> Portal for IP Office using the <b>WebRTC Gateway</b> service. Users can access it using a Chrome browser on Windows and Mac PCs.                                                 |
| <b>Web Collaboration</b>                                                                                                                                                                                                  | This service works with Avaya one-X <sup>®</sup> Portal for IP Office. It provides users with web collaboration services usable in parallel with audio conference hosted by IP Office.<br><br><ul style="list-style-type: none"> <li>This service is not supported for IP Office R12.0 and higher.</li> </ul> |

## System

This table gives a general overview of the server status. This section also provides controls to shutdown or reboot the server.

| Field                                | Description                                                                                                                                                                            |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>OS/Kernel</b>                     | The overall version of the Linux operating system installed on the server and the version of the operating system kernel.                                                              |
| <b>Up Time</b>                       | The system running time since the last server start.                                                                                                                                   |
| <b>Server Time</b>                   | The current time on the server.                                                                                                                                                        |
| <b>Average CPU Load</b>              | The average CPU load (percentage use) for the preceding minute, 5 minute and 15 minute periods. Note, it can take up to 10 minutes for CPU usage data to appear after a server reboot. |
| <b>Material Code</b>                 | The material code for the server. This code is used as part of the system registration with the Avaya Global Registration Tool (GRT).                                                  |
| <b>Model Info</b>                    | The model information for the server.                                                                                                                                                  |
| <b>System Manufacturer Serial No</b> | The manufacturer's serial number for the server.                                                                                                                                       |
| <b>Speed</b>                         | The processor speed.                                                                                                                                                                   |
| <b>Cores</b>                         | The number of processor cores.                                                                                                                                                         |

*Table continues...*

| Field                                  | Description                                                                                                             |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Hard Disk Size</b>                  | The hard disk size.                                                                                                     |
| <b>RAM</b>                             | The amount of RAM memory.                                                                                               |
| <b>Disk RAID Levels</b>                | The RAID type, if any, being used.                                                                                      |
| <b>Disk Array Types</b>                | The type of disk array being used for RAID.                                                                             |
| <b>Quota available for backup data</b> | Displays the amount of space reserved for local backups if <b>Enable HTTP file store for backup/restore</b> is enabled. |
| <b>Virtualized</b>                     | Indicates if the server is running as a virtualized session.                                                            |
| <b>Last Successful Logon</b>           | The date and time of the last successful logon, including the current logon.                                            |
| <b>Unsuccessful Logon Attempts</b>     | A count of unsuccessful logon attempts.                                                                                 |

| Control         | Description                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------|
| <b>Shutdown</b> | Selecting this button starts a process that stops all services and then shuts down the server.        |
| <b>Reboot</b>   | Selecting this button starts a process that stops all services and then stops and restart the server. |

## Debug Logs

Navigation: **Solution** >  > **Platform View** > **Logs** > **Debug Logs**

The menu shows the server application logs and audit log records.

| Settings               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Application Log</b> | This table lists the last 1000 log records for a selected server application. The <b>Application</b> drop-down selects the records shown. Clicking on a column header sorts the records using that column. For Voicemail Pro the level of log information output is set through the <b>Debug</b> section of the <b>Settings</b> > <b>General</b> menu. For Avaya one-X® Portal for IP Office the level of log information output is set through the Avaya one-X® Portal for IP Office administration menus. |
| <b>Audit Log</b>       | This table lists the actions performed by users logged in through the IP Office Server Edition web browser interface. Clicking on a column header sorts the records using that column.                                                                                                                                                                                                                                                                                                                      |

## Syslog Event Viewer

Navigation: **Solution** >  > **Platform View** > **Logs** > **Syslog Event Viewer**

This menu displays the server's Syslog records. These are combined records from the various applications (Voicemail Pro, Avaya one-X® Portal for IP Office, etc) running on the server and the server operating system itself. It also shows Syslog records received by the server from other servers. For example, in a Server Edition network, by default the Server Edition Secondary is configured to send its Syslog records to the Server Edition Primary.

You can use the **Settings** > **General** menu to configure the sending and receiving of Syslog records to and from other servers. You can also configure how long the server keeps different types of records and how many records it keeps.

The **Refresh** button is used to update the table of records shown using the options in the drop-down filters (**Host**, **Event Type**, **View** and **Tag**). Note however that the filter options are set when the menu is opened. To update the options, select another menu and then return to this menu. For example, if another host is added to the network and sends records to the server, the new server only appears in the **Host** drop-down after reloading the menu.

## Download

Navigation: **Solution** >  > **Platform View** > **System** > **Logs** > **Download**

You can use the menu to create and download archives files . For support issues, Avaya will require the archive files downloaded from the server. The server compresses the log files into a `.tar.gz` format file. You can then download the file by clicking on the link.

For IP Office 10.0, you can configure the server to include packet capture logs for the server, see [Packet Capture Settings](#) on page 146.

# Updates

Navigation: **Solution** >  > **Platform View** > **Updates**

This menu displays the different versions of server operating system files and application files available in the file repositories. The file repository locations are configured through the **Settings** > **General** page.

## System

You can access this menu by selecting **Updates**. The **System** section shows details of the operating system.

| Control               | Description                                                                                                                                                                                        |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Check Now</b>      | Clicking this button makes the IP Office Server Edition recheck the version of update files available in the file repository. Normally it does this automatically when the Updates page is loaded. |
| <b>Review updates</b> | Clicking this button will display a list of the available update files. This list allows selection of which updates you want to install.                                                           |
| <b>Update All</b>     | Clicking this button will install all the available updates without going through the process of selecting with updates to install.                                                                |

## Services

You can access this menu by selecting **Updates**. The **Services** section shows details of the current version of each application installed and the latest version available.

The **Change Version**, **Update**, **Update All**, and buttons in the panel are not useable unless appropriate update files are available in the applications software repository . This also affects the availability of the **Install** button option.

| Control               | Description                                                                                                                                                                                                                                 |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Change Version</b> | Clicking on this button shows the update files available for the application in the server's file repository with the current version selected. Selecting another version and clicking <b>Apply</b> upgrades or downgrades to that version. |
| <b>Update</b>         | Clicking on this button starts an update of the related application to the latest available version in the application file repository.                                                                                                     |

*Table continues...*

| Control                  | Description                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Uninstall</b>         | Clicking on this button uninstalls the selected application. <ul style="list-style-type: none"> <li>• If there are installation files for the application in the application file repository, the button becomes an <b>Install</b> button.</li> <li>• If there are no installation files for the application in the file repository, the menu no longer list the application.</li> </ul> |
| <b>Install</b>           | This button appears for uninstalled applications if the server has files for the application the application file repository.                                                                                                                                                                                                                                                            |
| <b>Check Now</b>         | Clicking this button makes the IP Office Server Edition recheck the version of update files available in the file repository. Normally it does this automatically when the <b>Updates</b> page is loaded.                                                                                                                                                                                |
| <b>Clear Local Cache</b> | Clicking this button removes older update installation files and other material that may accumulate on the server over time.                                                                                                                                                                                                                                                             |
| <b>Update All</b>        | Clicking this button upgrade those applications that support upgrading without being uninstalled (see above) to the latest versions available in the application file repository.                                                                                                                                                                                                        |

## Software Repositories

The IP Office Server Edition can use either remote or local software repositories to store software update files. The server has separate repositories for operating system updates, IP Office application installation files and Windows client files. The **Updates** and **AppCenter** menus use the files present in the appropriate repository.

| Field / Control            | Description                                                                                                                                                                                      |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Repository</b>          | If not using the <b>Local</b> option, this field sets the URL of a remote Linux OS repository. Note that you cannot use the same URL for more than one repository.                               |
| <b>Local</b>               | This checkbox sets whether the file repository used is local (files stored on the IP Office Server Edition) or remote (a folder on a HTTP web server specified in the Repository field).         |
| <b>File / Browse / Add</b> | With <b>Local</b> selected, you can use this field and adjacent buttons to browse for a specific update file. After selecting the file, click Add to upload the file to the server's file store. |

## Certificates

This menu allows the generation or downloading of the security certificate that can then be used by the IP Office applications hosted by the server. These menus are not available on Server Edition Secondary server and Server Edition Expansion System (L) servers.

| Field/Control         | Description |
|-----------------------|-------------|
| <b>CA Certificate</b> |             |

*Table continues...*

| Field/Control                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Create new</b>             | If selected, the server generates a new own security certificate when <b>Regenerate</b> is clicked.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Renew existing</b>         | If selected, the server's current self-generated security certificate is renewed when <b>Regenerate</b> is clicked.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Import</b>                 | If select, the fields for browsing to and selecting a certificate file to upload to the server appear. Select the file and click <b>Upload</b> .                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Export</b>                 | <p>The server's current security certificate is not included in any application backup and restore operations. The <b>Export</b> option allow you to export the server's current certificate as an encrypted file. You can then later restore the certificate back to the same server using the <b>Import</b> option.</p> <ul style="list-style-type: none"> <li>• <b>Password/Confirm Password:</b> Enter a password that the server then applies to the encrypted certificate file when using <b>Encrypt and Download</b>.</li> </ul> |
| <b>Encrypt and Download</b>   | When pressed, the server displays a pop-up link from which you can download an encrypted file containing the server's current certificate. Once you have downloaded the file it is deleted from the server.                                                                                                                                                                                                                                                                                                                             |
| <b>Regenerate</b>             | Create a certificate or renew the existing certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Download (PEM-Encoded)</b> | Download the certificate as a PEM file. You can then apply the certificate to any remote device that needs to establish secure encrypted connection with the server.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Download (DER-Encoded)</b> | Download the certificate as a CRT file. You can then the certificate to any remote device that needs to establish secure encrypted connection with the server.                                                                                                                                                                                                                                                                                                                                                                          |

| Field/Control                                     | Description                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Identity Certificates</b>                      |                                                                                                                                                                                                                                                                                                                                                   |
| <b>Renew automatically</b>                        | If selected, the server automatically generates a new security certificate following any major change such as changes to its LAN settings. The server automatically applies the new certificate to the application services run on the server.                                                                                                    |
| <b>Create certificate for a different machine</b> | If selected, the server can generate a new security certificate for another server. Note however that this requires a settings to exactly match those of the other server in order for the certificate to be regarded as valid for one offered by that other server.                                                                              |
| <b>Regenerate and Apply</b>                       | When clicked, the server generates a new security certificate using the identity settings specified. The server then applies the security certificate to the IP Office application services run by the server. Note that this process requires the services to all be automatically stopped and restarted which will end any current connections. |
| <b>Download (PEM-Encoded)</b>                     | Download the certificate as a PEM file. You can then apply the certificate to any remote device that needs to establish secure encrypted connection with the server.                                                                                                                                                                              |

*Table continues...*

| Field/Control                 | Description                                                                                                                                                    |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Download (DER-Encoded)</b> | Download the certificate as a CRT file. You can then the certificate to any remote device that needs to establish secure encrypted connection with the server. |

## Backup and Restore

These controls allow you to backup and restore the application settings of selected IP Office applications.

- This is a local backup onto the same server and should only be used when directed by Avaya support.
- For more advanced backup and restore functions, see [Backup and Restore](#) on page 642.
- These options are not shown if the web control menus are accessed as an embedded window from within Web Manager.

## EASG Settings

The server uses these settings for connections from an Avaya Enhanced Access Security Gateway (EASG) server. EASG is used by systems' being supported directly by Avaya. It allows Avaya technician access to the server for server maintenance.

Note that only users with Web Services Security rights are able to change the EASG settings.

| Field/Control | Description                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Status</b> | This field sets whether the EASG service is enabled on the server. In order to use EASG the server's product ID must be registered through the Avaya Global Registration Tool (GRT) website. |

*Table continues...*

| Filed/Control                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**one-X Portal Settings**

For a Server Edition network, the Avaya one-X® Portal for IP Office service normally run on the IP Office Server Edition server can be replaced by the portal service running on an IP OfficeApplication Server. After stopping and disabling the auto-start of the primary server's portal service, the following fields are used to

For IP Office Release 10, the Server Edition Secondary server can also host a portal service for resiliency, refer to the *Administering Avaya one-X Portal for IP Office* manual for full details. In that case, again, the portal service on the secondary can be replaced by one running on an IP OfficeApplication Server in the same way.

| Field/Control       | Description                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use Local IP</b> | Select this option if the server is hosting the Avaya one-X® Portal for IP Office application. If not selected, the Avaya one-X® Portal for IP Office service should be stopped and its auto-start options disabled. The IP address of the IP OfficeApplication Server hosting the alternate Avaya one-X® Portal for IP Office must be indicated in the <b>Remote IP</b> field below. |
| <b>Remote IP</b>    | If <b>Use Local IP</b> is not selected, this field sets the IP address of the separate IP OfficeApplication Server hosting the Avaya one-X® Portal for IP Office application.                                                                                                                                                                                                         |

### **Warning:**

- **! = Host PLDS ID Field**

For a virtualized server, IP Office uses the fields marked with a ! symbol to generate the **Host PLDS ID**. Changing any of the fields can change that ID. If you have used the ID to generate local (nodal) PLDS licenses, those licenses become invalid. This does not affect WebLM (centralized) PLDS licenses. Refer to the manual "*Deploying Avaya IP Office Servers as Virtual Machines*" for further details.

### **Important:**

- **\* = Security Certificate Field**

The IP Office uses fields marked with a \* symbol as part of the self-signed certificate it generates. If you change one of these fields, the IP Office generates a new self-signed certificate. Certificate generation disrupts access to the server for several minutes. In addition, you must update the certificate used by any applications.

| Settings                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Network Interface</b> | Default = Eth0<br><br>Selects the network interfaces you are configuration. Within the IP Office configuration, <b>Eth0</b> matches <b>LAN1</b> , <b>Eth1</b> matches <b>LAN2</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Enable IPv6</b>       | Default = Disabled<br><br>When enabled, the IP Office system supports IPv6 features on the selected LAN. IP Office supports IPv6 on Linux-based IP Office systems only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Host Name ! *</b>     | Sets the host name that the IP Office Server Edition should use. This setting requires the local network to support a DNS server. Do not use <b>localhost</b> .<br><br><ul style="list-style-type: none"> <li>• For internal use, this value must be resolvable by DNS within the customer network.</li> <li>• If the IP Office is also supporting external client connections, the value must also be resolvable to the IP Office by external DNS. External access must also include a firewall and/or SBC.</li> <li>• Consult with the customer's IT support to ensure the name is acceptable and that routing to it is configured correctly.</li> </ul> |
| <b>Use DHCP ! *</b>      | If selected, the IP Office obtains its IP address, subnet mask and default gateway information by making a DHCP request. The menu displays the values obtained.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>IP Address ! *</b>    | Displays the IP address set for the server. If not using DHCP, you can edit the field to change the setting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Subnet Mask</b>       | Displays the subnet mask applied to the IP address. If not using DHCP, you can edit the field to change the setting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Default Gateway</b>   | Displays the default gateway settings for routing. If not using DHCP, you can edit the field to change the setting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Date and Time

The server uses these settings to set or obtain a UTC date and time.

#### Important:

- Avaya strongly recommend **Enable Network Time Protocol Client** is enabled and a list of **NTP Servers** set. An accurate time is essential for features which use certificates and/or subscriptions.

| Settings                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Authentication

This menu controls the method of password storage and authentication used by server applications.

- These settings are only accessible if logged in using referred authentication or as the local Linux root. When disabled, the setting can only be re-enabled by logging in using the local Linux root name and password.

| Settings                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Change Root Password

Server installation creates two Linux user accounts; *root* and *Administrator*. You can use these fields to change the Linux *root* account password.

- These settings are only accessible if logged in via referred authentication or as the local Linux root. Therefore, when disabled, the setting can only be re-enabled by logging in using the local Linux root name and password.
- Note that this is separate from the password for the IP Office *Security* account. Whilst both accounts are given the same password during server ignition, this menu changes just the Linux account password. You can change the IP Office *Security* account password through the IP Office security settings.

## Password Rules Settings

These settings set the password requirements used when changing passwords through using these menus.

| Settings                                      | Description                                                                                                                                                                                                                                              |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Minimum password length</b>                | This field set the minimum length of new passwords. Note that the combined requirements of the fields below for particular character types may create a requirement that exceed this value. Note also that the maximum password length is 31 characters. |
| <b>Minimum number of uppercase characters</b> | This field sets the number of uppercase alphabetic characters that new passwords must contain.                                                                                                                                                           |

| Settings                                      | Description                                                                                                                                                   |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Minimum number of lowercase characters</b> | This field sets the number of lowercase alphabetic characters that new passwords must contain.                                                                |
| <b>Minimum number of numeric characters</b>   | This field sets the number of numeric characters that new passwords must contain.                                                                             |
| <b>Minimum number of special characters</b>   | This field sets the number of non-alphanumeric characters that new passwords must contain.                                                                    |
| <b>Allow character sequences</b>              | When selected, the server allows character sequences such as 1234, 1111, or abcd. When not selected, the field below sets the maximum length of any sequence. |
| <b>Maximum allowed sequence length</b>        | When <b>Allow character sequences</b> is not selected, this field sets the maximum allowed length of any character sequence.                                  |

## Firewall Settings

The IP Office server can apply firewall controls to the incoming traffic it receives. These are in addition to firewall profile settings added to the IP Office service configuration.

| Settings        | Description                                                                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Activate</b> | <p>Default = On</p> <p>Sets whether the firewall is active. You must enable this setting if the IP Office configuration is using any firewall profile settings.</p> |

## AppCenter

**Solution** >  > **Platform View** > **AppCenter**

You can access this menu by selecting **AppCenter**. You can use the menu to download files for use on the local PC. For example, the Voicemail Pro client used to administer the Voicemail Pro server application.

Note that some packages require the addition of licenses to the system and configuration changes. Refer to the specific installation manuals for those applications:

# Part 3: The Call Management Menu

## The Call Management Menus

The **Call Management** menu provides access to various configuration records for key features. The lists for each type can be used to add, edit and delete those records.

| Sub-Menu               | Description                                                                                                                                                                                                                         |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Auto Attendants</b> | Auto-attendants are services that the system can provide to answer calls and prompt the caller for which service they require or who they want to talk to. Auto attendants can be used as the destination for incoming call routes. |
| <b>Conferences</b>     | In addition to ad-hoc and personal conference features, systems support system meet-me conferences.                                                                                                                                 |
| <b>Extensions</b>      | Each physical phone (desk phone) registered with the system requires a matching extension record in the system configuration.                                                                                                       |
| <b>Groups</b>          | Groups are collections of multiple users. Each group has an extension number and can be used as the destination for calls.                                                                                                          |
| <b>Users</b>           | Users are the individual users who make and answer calls. They can do this via physical phones or softphone applications.                                                                                                           |

# Chapter 14: Users

Navigation: **Call Management > Users**

## Additional configuration information

This section provides the **Users** field descriptions.

For additional configuration information, see [Configure User Settings](#) on page 835.

## Main content pane

The **Users** main content pane lists provisioned users. The contents of the list depends on the filter option selected. Click the icons beside a record to edit or delete.

**Bulk delete:** You can delete multiple records. Select the check box to the right of each record you want to delete and click **Delete**. You receive a prompt to confirm the deletion.

Click **Actions** for import, export, and template management options.

Click **Add/Edit Users** to open the Add Users window where you can provision a user. When you click **Add/Edit Users**, you are prompted to specify the server on which the user will be provisioned.

## User Filters

| Filter             | Description                                                      |
|--------------------|------------------------------------------------------------------|
| <b>Show All</b>    | List all provisioned users on all systems.                       |
| <b>Systems</b>     | List the users provisioned on a specific system.                 |
| <b>User Type</b>   | List a specific provisioned user type on all systems.            |
| <b>User Rights</b> | List users provisioned with specific user rights on all systems. |
| <b>Hunt Groups</b> | List users that are members of a hunt group.                     |

## Import Users

Navigation: **Call Management > Users > Actions > Import Users**

Bulk provision users by importing a xml or csv file. You can download example files.

| Field               | Descriptions                                           |
|---------------------|--------------------------------------------------------|
| Import To           | Specify the system where the file will be imported to. |
| Select a File       | Select the file on the local machine.                  |
| Sample Import Files | Download a sample user file.                           |

## Create From Template

Navigation: **Call Management > Users > Actions > Create From Template**

Use this page to add users using a template. You can define user templates by selecting **Call Management > Users > Actions > Template Management**.

When you click **Create From Template** and then select a server, the Select Template window opens.

Once you have defined the settings below and click **OK**, the Provision Users page opens.

| Field                           | Description                                     |
|---------------------------------|-------------------------------------------------|
| <b>Enter number of records</b>  | Enter the number of records you want to create. |
| <b>Enter starting extension</b> | Enter the extension number of the first record. |
| <b>Select Template</b>          | Select a template from the list.                |

[User Actions](#) on page 161

## Provision Users

Navigation: **Call Management > Users > Actions > Create From Template > Select Template > Provision Users**

This page displays the user records that will be created based on the values entered in the Select Template window.

At the top of the page, the **Preview Users Data** area indicates the server on which the users will be created, the number of records (**Total Records Read**) and the **Records with Error**.

The table lists the user records that will be created and the values that have been populated based on the template. You can remove records from the list using **Delete Selected Records**. You can modify the display by turning **Show Error Records** on or off.

You can modify a record by clicking the edit icon for the record to open the User - Edit window.

When you are ready to create the new user records, click **Create**.

# Users

Navigation: **Call Management > Users > Add/Edit Users > User**

## Additional configuration information

- For a summary of user management, including a description of centralized users, see [User Management Overview](#) on page 835.
- The **Unique Identity** setting is used to configure Gmail Integration. For additional information, see [Configuring Gmail Integration](#) on page 837.

Users are the people who use the system or are Dial In users for data access. A user does not have to have an extension number that physical exists - this is useful if the user do not require a physical extension but wish to use system features.

- The **NoUser** user is used to apply settings to extensions which have no associated user. Do not delete this user/
- The **Remote Manager** user is used as the default settings for dial in connections.

## Configuration Settings

You can edit these settings online without needing to reboot the IP Office.

- Except adding/removing centralized branch users which requires a system reboot.

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Profile Settings

Each user can be assigned to a particular profile. Each profile, other than **Basic User**, requires the system to have a matching license or subscription available for the user.

The profile assigned to the user controls whether they can have a number of additional settings enabled. The tables below list those settings and profiles. The items in ( ) brackets indicate the default status for the settings when that profile is selected.

### IP500 V2 PLDS Licensed Systems

| Option                                                              | Basic User | Office Worker         | Teleworker            | Mobile Worker | Power User |

### User Profile Notes:

1. Non-licensed users can be created on both Standard Mode and Server Edition systems.
2. The system supports users using remote H.323 or SIP extensions. On non-Server Edition systems, up to 4 users are supported as remote extensions without needing to be configured and licensed for a user profile. Additional remote users are supported if licensed and configured for either a **Teleworker** or **Power User** user profile. On Server Edition systems, the remote worker is supported for all user profiles.
3. Supports the Avaya Workplace Client in standalone mode only. Simultaneous mode, shared call control mode, and presence are not available and supports local contacts only (not enterprise or IP Office contacts). See the *IP Office Avaya Workplace Client Installation Notes* manual.
  - On PLDS licensed IP500 V2 systems, Avaya Workplace Client can be used with a **Basic User** with **IP Softphone** license or a **Mobile Worker** with **IP Softphone** license.

| Field                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Hunt Group Membership

This drop-down allows you to quickly select the hunt groups to which the user belongs.

## User Rights

Selected user settings can be overridden by those set within a set of User Rights. The same user rights can be applied to multiple users.

In addition, a time profile can be used to control when the user rights are applied to the user, and whether at other times, a different set of user rights are applied or the user's own settings.

| Field                             | Description                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>User Rights View</b>           | This field affects Manager only. It allows you to switch between displaying the user settings as affected by their associated <b>Working Hours User Rights</b> or <b>Out of Hours User Rights</b> .                                                                                                                                        |
| <b>Working Hours Time Profile</b> | Default = <None> (Continuous).<br>If set, the selected time profile defines when the user's <b>Working Hours User Rights</b> are applied. Outside the time profile, the user's <b>Out of Hours User Rights</b> are applied                                                                                                                 |
| <b>Working Hours User Rights</b>  | Default = Blank (No rights restrictions).<br>This field allows selection of user rights which may set and lock some user settings. If a <b>Working Hours Time Profile</b> has been selected, the <b>Working Hours User Rights</b> are only applied during the times defined by that time profile, otherwise they are applied at all times. |
| <b>Out of Hours User Rights</b>   | Default = Blank (No rights restrictions).<br>This field allows selection of alternate user rights that are used outside the times defined by the user's Working Hours Time Profile.                                                                                                                                                        |

## Voicemail

Navigation: **Call Management > Users > Add/Edit Users > Voicemail**

### Additional configuration information

The **Enable Gmail API** setting is used to configure Gmail Integration.

For additional information, see [Configuring Gmail Integration](#) on page 837.

### Configuration settings

If a voicemail server application is being used on your system, each user has use of a voicemail mailbox. You can use this form to enable this facility and various user voicemail settings.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Voicemail Code</b> | <p>Default = Blank. Range = 0 (no code) to 31 digits.</p> <p>A code used by the voicemail server to validate access to this mailbox. If remote access is attempted to a mailbox that has no voicemail code set, the prompt "Remote access is not configured on this mailbox" is played.</p> <p>The mailbox access code can be set through IP Office Manager or through the mailbox telephone user interface (TUI). The minimum password length is:</p> <ul style="list-style-type: none"> <li>• Voicemail Pro (Manager): 0</li> <li>• Voicemail Pro (Intuity TUI): 2</li> <li>• Embedded Voicemail (Manager): 0</li> <li>• Embedded Voicemail (Intuity TUI): 0</li> </ul> <p>Codes set through the Voicemail Pro telephone user interface are restricted to valid sequences. For example, attempting to enter a code that matches the mailbox extension, repeat the same number (111111) or a sequence of numbers (123456) are not allowed. If these types of code are required they can be entered through Manager.</p> <p>Manager does not enforce any password requirements for the code if one is set through Manager.</p> <ul style="list-style-type: none"> <li>• <b>Embedded Voicemail:</b> For Embedded Voicemail running in IP Office mailbox mode, the voicemail code is used if set.</li> <li>• <b>IP Office mode:</b> The voicemail code is required when accessing the mailbox from a location that is not set as a trusted number in the user's Source Numbers list.</li> <li>• <b>Intuity Emulation mode:</b> By default the voicemail code is required for all mailbox access. The first time the mailbox is accessed the user will be prompted to change the password. Also if the voicemail code setting is left blank, the caller will be prompted to set a code when they next access the mailbox. The requirement to enter the voicemail code can be removed by adding a customized user or default collect call flow, refer to the Voicemail Pro manuals for full details.</li> <li>• <b>Trusted Source Access:</b> The voicemail code is required when accessing the mailbox from a location that is not set as a trusted number in the user's Source Numbers list.</li> <li>• <b>Call Flow Password Request:</b> Voicemail Pro call flows containing an action where the action's PIN code set to \$ will prompt the user for their voicemail code.</li> <li>• <b>Changing the Code:</b> All of the voicemail interfaces, except IMS and IMAP, provide options for the user to change the voicemail code themselves. In addition, Voicemail Pro running in Intuity emulation mode will request that the user sets a code when they first log in to their mailbox using the phone.</li> </ul> |

| Field                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Voicemail On</b>            | <p>Default = On.</p> <p>When on, the mailbox is used by the system to answer the user's unanswered calls or calls when the user's extension returns busy. Note that selecting off does not disable use of the user's mailbox. Messages can still be forward to their mailbox and recordings can be placed in it. The mailbox can also still be accessed to collect messages.</p> <p>When a caller is directed to voicemail to leave a message, the system indicates the target user or hunt group mailbox.</p> <ul style="list-style-type: none"> <li>• The mailbox of the originally targeted user or hunt group is used. This applies even if the call has been forwarded to another destination. It also includes scenarios where a hunt group call overflows or is in fallback to another group.</li> <li>• Voicemail Pro can be used to customize which mailbox is used separately from the mailbox indicated by the system.</li> </ul> |
| <b>Voicemail Help</b>          | <p>Default = Off</p> <p>This option controls whether users retrieving messages are automatically given an additional prompt "For help at any time press 8." If switched off, users can still press 8 for help. For voicemail systems running in Intuity emulation mode, this option has no effect. On those systems the default access greeting always includes the prompt "For help at any time, press *4" (*H in the US locale).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Voicemail Ringback</b>      | <p>Default = Off </p> <p>When enabled and a new message has been received, the voicemail server calls the user's extension to attempt to deliver the message each time the telephone is put down. Voicemail will not ring the extension more than once every 30 seconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Voicemail Email Reading</b> | <p>Default = Off</p> <p>This option can be enabled for users whose Profile is set to <b>Mobile Worker</b> or <b>Power User</b>. If enabled, when you log into you voicemail box, it will detect your email messages and read them to you. This email text to speech feature is set-up through Voicemail Pro. This option is not currently supported with Linux based Voicemail Pro.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>UMS Web Services</b>        | <p>Default = On</p> <p>When selected, the user can use any of the Voicemail Pro UMS services to access their voicemail messages (IMAP email client, web browser or Exchange 2007 mailbox). Note that the user must have a voicemail code set in order to use the UMS services.</p> <ul style="list-style-type: none"> <li>• For subscription systems, this setting is only supported for <b>UC User</b>.</li> <li>• For PLDS licensed systems, this setting is only supported for <b>Teleworker, Office Worker</b> or <b>Power User</b> users.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Enable Gmail API</b> | <p>Default = Off.</p> <p>This setting is only supported on Server Edition systems and requires the used to have <b>UMS Web Services</b> enabled. When enabled:</p> <ul style="list-style-type: none"> <li>• The <b>Voicemail Email</b> setting is disabled.</li> <li>• The <b>Voicemail Email Mode</b> options (<b>Off</b>, <b>Copy</b>, <b>Forward</b>, <b>Alert</b>) are available.</li> </ul> <p>This feature uses the Gmail address defined in the setting <b>Call Management &gt; Users &gt; Add/Edit Users &gt; User &gt; Unique Identity</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Voicemail Email</b>  | <p>Default = Blank (No voicemail email features)</p> <p>This field is used to set the user or group email address used by the voicemail server for voicemail email operation. When an address is entered, the additional Voicemail Email control below are selectable to configure the type of voicemail email service that should be provided.</p> <p>Use of voicemail email requires the Voicemail Pro server to have been configured to use either a local MAPI email client or an SMTP email server account. For Embedded Voicemail, voicemail email is supported and uses the system's SMTP settings.</p> <p>The use of voicemail email for the sending (automatic or manual) of email messages with wav files attached should be considered with care. A one-minute message creates a 1MB .wav file. Many email systems impose limits on emails and email attachment sizes. For example the default limit on an Exchange server is 5MB.</p> <p> <b>Note:</b></p> <p>Unicode characters are not supported.</p> |

| Field                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Voicemail Email Mode</b> | <p>Default = Off</p> <p>This option is selectable when for users and groups when either:</p> <ul style="list-style-type: none"> <li>• A <b>Voicemail Email</b> email address is set.</li> <li>• The <b>Enable Gmail API</b> is set to <b>On</b>.</li> </ul> <p>These settings control the mode of automatic voicemail email operation provided by the voicemail server whenever the voicemail mailbox receives a new voicemail message. Users can change their voicemail email mode using visual voice. The ability to change the voicemail email mode can also be provided by Voicemail Pro in a call flow using a Play Configuration Menu action or a Generic action.</p> <p>If the voicemail server is set to IP Office mode</p> <ul style="list-style-type: none"> <li>• Users can change their voicemail email mode through the telephone prompts.</li> <li>• users can manually forward a message to email.</li> </ul> <p>The options are:</p> <ul style="list-style-type: none"> <li>• <b>Off</b> If off, none of the options below are used for automatic voicemail email. Users can also select this mode by dialing *03 from their extension.</li> <li>• <b>Copy</b> If this mode is selected, each time a new voicemail message is received in the voicemail mailbox, a copy of the message is attached to an email and sent to the email address. There is no mailbox synchronization between the email and voicemail mailboxes. For example reading and deletion of the email message does not affect the message in the voicemail mailbox or the message waiting indication provided for that new message.</li> <li>• <b>Forward</b> If this mode is selected, each time a new voicemail message is received in the voicemail mailbox, that message is attached to an email and sent to the email address. No copy of the voicemail message is retained in the voicemail mailbox and there is no message waiting indication. As with Copy, there is no mailbox synchronization between the email and voicemail mailboxes. Users can also select this mode by dialing *01 from their extension.</li> </ul> <p>Note that until email forwarding is completed, the message is present in the voicemail server mailbox and so may trigger features such as message waiting indication.</p> <ul style="list-style-type: none"> <li>• <b>UMS Exchange 2007</b> With Voicemail Pro, the system supports voicemail email to an Exchange 2007 server email account. For users and groups also enabled for UMS Web Services this significantly changes their mailbox operation. The Exchange Server inbox is used as their voicemail message store and features such as message waiting indication are set by new messages in that location rather than the voicemail mailbox on the voicemail server. Telephone access to voicemail messages, including Visual Voice access, is redirected to the Exchange 2007 mailbox.</li> <li>• <b>Alert</b> If this mode is selected, each time a new voicemail message is received in the voicemail mailbox, a simple email message is sent to the email address. This is an email message announcing details of the voicemail message but with no copy of the voicemail message attached. Users can also select this mode by dialing *02 from their extension.</li> </ul> |

| Field                                                                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DTMF Breakout</b>  | <p>When a caller is directed to voicemail to leave a message, they can be given the option to be transferred to a different extension. The greeting message needs to be recorded telling the caller the options available. The extension numbers that they can be transferred to are entered in the fields below. System default values can be set for these numbers and are used unless a different number is set within these user settings. The values can be set using User Rights.</p> <p>The Park &amp; Page feature is supported when the system voicemail type is configured as <b>Embedded Voicemail</b> or <b>Voicemail Pro</b>. Park &amp; Page is also supported on systems where Avaya Aura Messaging, Modular Messaging over SIP, or CallPilot (for Enterprise Branch with CS 1000 deployments) is configured as the central voice mail system and the local Embedded Voicemail or Voicemail Pro provides auto attendant operation. The Park &amp; Page feature allows a call to be parked while a page is made to a hunt group or extension. This feature can be configured for Breakout DTMF 0, Breakout DTMF 2, or Breakout DTMF 3.</p>                                                                                                                                                                                                                                                                                                                                    |
| <b>Reception/<br/>Breakout (DTMF 0)</b>                                                                | <p>The number to which a caller is transferred if they press 0 while listening to the mailbox greeting rather than leaving a message (*0 on Embedded Voicemail in IP Office mode).</p> <p>For voicemail systems set to Intuity emulation mode, the mailbox owner can also access this option when collecting their messages by dialing *0.</p> <p>If the mailbox has been reached through a Voicemail Pro call flow containing a <b>Leave Mail</b> action, the option provided when 0 is pressed are:</p> <ul style="list-style-type: none"> <li>• For IP Office mode, the call follows the <b>Leave Mail</b> action's <b>Failure</b> or <b>Success</b> results connections depending on whether the caller pressed 0 before or after the record tone.</li> <li>• For Intuity mode, pressing 0 always follows the <b>Reception/Breakout (DTMF 0)</b> setting.</li> </ul> <p>When Park &amp; Page is selected for a DTFM breakout, the following drop-down boxes appear:</p> <ul style="list-style-type: none"> <li>• <b>Paging Number</b> – displays a list of hunt groups and users (extensions). Select a hunt group or extension to configure this option.</li> <li>• <b>Retries</b> – the range is 0 to 5. The default setting is 0.</li> <li>• <b>Retry Timeout</b> – provided in the format M:SS (minute:seconds). The range can be set in 15-second increments. The minimum setting is 15 seconds and the maximum setting is 5 minutes. The default setting is 15 seconds</li> </ul> |
| <b>Breakout (DTMF 2)</b>                                                                               | The number to which a caller is transferred if they press 2 while listening to the mailbox greeting rather than leaving a message (*2 on Embedded Voicemail in IP Office mode).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Breakout (DTMF 3)</b>                                                                               | The number to which a caller is transferred if they press 3 while listening to the mailbox greeting rather than leaving a message (*3 on Embedded Voicemail in IP Office mode).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### Additional configuration information

For additional information on programming button actions, see [Button Programming Overview](#) on page 1086.

### Configuration settings

Used to assign functions to the programmable keys provided on many Avaya telephones. For full details of button programming refer to the section Button Programming.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field              | Description                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Button No.</b>  | The number of the DSS key against which the function is being set. To set a function against a button double-click it or select it and then click <b>Edit</b> . |
| <b>Label</b>       | This is a text label for display on the phone. If no label is entered, the default label for the selected action is used.                                       |
| <b>Action</b>      | Defines the action taken by the menu item.                                                                                                                      |
| <b>Action Data</b> | This is a parameter used by the selected action. The options here will vary according to the selected button action.                                            |

|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Outside Call Sequence</b> | Default = Default Ring (Use system setting)<br><br>Applies only to analog phones. Sets the ring pattern used for external calls to the user. The distinctive ring patterns used for other phones are fixed. Note that changing the pattern for users associated with fax and modem device extensions can cause those devices to not recognize and answer calls.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Inside Call Sequence</b>  | Default = Default Ring (Use system setting)<br><br>Applies only to analog phones. Sets the ring pattern used for internal calls to the user. The distinctive ring patterns used for other phones are fixed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Ring Back Sequence</b>    | Default = Default Ring (Use system setting)<br><br>Applies only to analog phones. Sets the ring pattern used for ringback calls to the user. The distinctive ring patterns used for other phones are fixed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>No Answer Time</b>        | Default = Blank (Use system setting). Range = 6 to 99999 seconds. 🛡️<br><br>Sets how long a call rings the user before following forwarded on no answer if set or going to voicemail. Leave blank to use the system default setting ( <b>System &gt; Telephony &gt; Telephony &gt; Default No Answer Time</b> ).<br><br><ul style="list-style-type: none"> <li>For users who are using Avaya Workplace Client on iOS devices, it is recommended to set the time to at least 20 seconds.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Wrap-up Time (secs)</b>   | Default = 2 seconds, Range 0 to 99999 seconds. 🛡️ Specifies the amount of time after ending one call during which the user is treated as still being busy. During this time: <ul style="list-style-type: none"> <li>Other phones or applications monitoring the user's status indicate the user as still being busy (on a call).</li> <li>Hunt group calls are not presented to the user.</li> <li>If the user is using a single line set, direct calls also receive busy treatment. If the user is using a mutli-line set (multiple call appearances), direct calls to them will ring as normal.</li> <li>It is recommended that this option is not set to less than the default of 2 seconds. 0 is used to allow immediate ringing.</li> <li>The user's wrap-up time setting is added to the system hold recall time for calls put on hold by the user.</li> </ul> |

| <b>Transfer Return Time (secs)</b>                | <p>Default = Blank (Off), Range 1 to 99999 seconds. 🗝️</p> <p>Sets the delay after which any call transferred by the user, which remains unanswered, should return to the user. A return call will continue ringing and does not follow any forwards or go to voicemail.</p> <ul style="list-style-type: none"> <li>• Transfer return will occur if the user has an available call appearance button.</li> <li>• Transfer return is not applied if the transfer is to a hunt group that has queuing enabled.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Call Cost Mark-Up</b>                          | <p>Default = 100.</p> <p>This setting is used for ISDN advice of charge (AOC). The markup is applied to the cost calculations based on the number of units and the line base cost per charging unit. The field is in units of 1/100th, for example an entry of 100 is a markup factor of 1. This value is included in the system SMDR output.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Advertize Callee State To Internal Callers</b> | <p>Default = System Default (Off).</p> <p>The options are:</p> <ul style="list-style-type: none"> <li>• <b>System Default (Off)</b>. The system setting is <b>System Settings &gt; System &gt; Telephony &gt; Advertize Callee State To Internal Callers</b>.</li> <li>• <b>On</b></li> <li>• <b>Off</b></li> </ul> <p>When enabled, for internal calls, additional status information is communicated to the calling party.</p> <p>Not supported for SIP endpoints except the J100 Series (excluding the J129).</p> <ul style="list-style-type: none"> <li>• When calling another internal phone and the called phone is set to Do Not Disturb or on another call, the calling phone displays “Do Not Disturb” or “On Another Call” rather than “Number Busy”.</li> <li>• On 9400, 9500, 9600, and J100 Series phones, if a line appearance is programmed on a button on phone A and that line is in use on phone B, then phone A displays the name of the current user of the line along with the line number.</li> <li>• If a line appearance on a phone is in use elsewhere in the system and another extension unsuccessfully attempts to seize that line, the phone displays “In Use:&lt;name&gt;” where &lt;name&gt; is the name of the user currently using the line.</li> </ul> |
| <b>Call Waiting On</b>                            | <p>Default = Off 🗝️</p> <p>For users on phones without appearance buttons, if the user is on a call and a second call arrives for them, an audio tone can be given in the speech path to indicate a waiting call (the call waiting tone varies according to locale). The waiting caller hears ringing rather than receiving busy. There can only be one waiting call, any further calls receive normal busy treatment. If the call waiting is not answered within the no answer time, it follows forward on no answer or goes to voicemail as appropriate. User call waiting is not used for users on phones with multiple call appearance buttons.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Answer Call Waiting on Hold</b> | <p>Default = On</p> <p>Applies to analog and IP DECT extension users only. If the user has a call waiting and places their current call on hold, the waiting call is automatically connected.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Busy on Held</b>                | <p>Default = Off for users with call appearance buttons/On for other users. </p> <p>If on, when the user has a call on hold, new calls receive busy treatment. They will follow the user's forward on busy setting or are diverted to voicemail. Otherwise busy tone (ringing for incoming analog calls) is played. This overrides call waiting when the user has a call on hold. The use of <b>Busy on Held</b> for users with multiple call appearance buttons is deprecated and Manager will prompt whether it should switch off the feature off for such a user.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Offhook Station</b>             | <p>Default = Off</p> <p>Off-hook station allows an analog extension to be left permanently off-hook, with calls being made and answered using an application or TAPI. When enabled, the analog extension user is able to control calls using the application in the following ways:</p> <p>Offhook station does not disable the physical off-hook on the phone. When starting with the phone on-hook, making and answering calls is the same as normal analog extension operation. Additionally however calls can be initiated from the application. After entering the required number and making the call, the on-hook analog extension receives a ringback showing the users own caller ID and when answered the outgoing call leg to the dialed number is started. Calls to a busy destination present busy tone before being cleared.</p> <p>The application can be used to end a call with the analog extension still off-hook. Instead of hearing disconnect tone the user hears silence and can use the application to make another call. Though off-hook the user is indicated as idle on BLF indicators. Without off-hook Station set the user would be indicated as busy when off-hook, whether on a call or not.</p> <p>If off-hook and idle (having cleared a previous call), incoming call alerts by presenting ringing through the audio path. The call can be answered using the application or going on-hook/off-hook or by pressing recall. Note that if the phone normally displays call ID, any caller ID displayed on the phone is not updated in this mode, however the call ID in the application will be that of the current call.</p> <p>If on-hook, an incoming call alerts as normal using the phone's ringer and is answered by going off-hook. The answer call option in the application cannot be used to answer calls to an on-hook analog extension.</p> <p>While off-hook and idle, the analog extension user will receive page calls.</p> <p>If the analog extension handset is replaced with a headset, changing the Manager setting <b>Extension   Analog   Equipment Classification</b> to <b>Quiet Handset</b> is recommended.</p> |

| <b>Privacy Override Group</b>  | <p>Default = &lt;None&gt;</p> <p>The drop-down menu lists the local and network advertised hunt groups. If selected, calls to this user cannot be seen or picked up by other users unless they are a member of the selected group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Coverage Group</b>          | <p>Default = &lt;None&gt;. </p> <p>If a group is selected, then in scenarios where an external call would normally have gone to voicemail, it instead continues ringing and also starts alerting the members of the coverage group. See <a href="#">Coverage Groups</a> on page 897.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Status on No Answer</b>     | <p>Default = Logged On.</p> <p>Hunt groups can change the status of call center agents (users with a log in code and set to forced log in) who do not answer a hunt group call presented to them before it is automatically presented to the next agent. Use of this is controlled by the <b>Agent's Status on No Answer Applies To</b> setting of the hunt group. This option is not used for calls ringing the agent because the agent is in another group's overflow group. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Logged On:</b> If this option is selected, the user's status is not changed.</li> <li>• <b>Busy Wrap-Up:</b> If this option is selected the user's membership status of the hunt group triggering the action is changed to disabled. The user can still make and receive calls and will still continue to receive calls from other hunt groups to which they belong.</li> <li>• <b>Busy Not Available:</b> If this option is selected the user's status is changed to do not disturb. This is the equivalent of DND and will affect all calls to the user.</li> <li>• <b>Logged Off:</b> If this option is selected the users status is changed to logged out. In that state they cannot make calls or receive calls. Hunt group calls go to the next available agent and personal calls treat the user as being busy.</li> </ul> |
| <b>Reset Longest Idle Time</b> | <p>Default = All Calls.</p> <p>This setting is used in conjunction with hunt groups set to Longest Waiting (also known as Idle and Longest Waiting). It defines what type of calls reset the idle time of users who are members of these hunt groups. Options are <b>All Calls</b> and <b>External Incoming</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Force Login</b>             | <p>Default = Off </p> <p>If checked, the user must log in using their <b>Login Code</b> to use any extension including an extension to which they are the default associated user (<b>Base Extension</b>).</p> <p>For example: If user B has logged onto user A's phone and now logs off</p> <ul style="list-style-type: none"> <li>• If user A has <b>Force Login</b> enabled, they are not automatically logged back on to their extension.</li> <li>• If user A do not have <b>Force Login</b> enabled, they are automatically logged back in.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Force Account Code</b>      | <p>Default = Off </p> <p>If checked, the user must enter a valid account code to make an external call.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Field                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Force Authorization Code</b>             | Default = Off.<br>If checked, the user must enter a valid authorization code to make an external call. That authorization code must be one associated with the user or the user rights to which the user belongs.                                                                                                                                                                                                                                                                                    |
| <b>Incoming Call Bar</b>                    | Default = Off <br>When enabled, this setting stops a user from receiving any external calls. On the calling phone, the call is rejected.                                                                                                                                                                                                                                                                            |
| <b>Outgoing Call Bar</b>                    | Default = Off <br>When enabled, this setting stops a user from making any external calls except those that use dial emergency features. On many Avaya display phones, this causes a <b>B</b> to be displayed. The following features can be used with outgoing call bar: Outgoing Call Bar On, Outgoing Call Bar Off and Change Login Code.                                                                         |
| <b>Inhibit Off-Switch Forward/Transfers</b> | Default = Off.<br>When enabled, this setting stops the user from transferring or forwarding calls externally. This does not stop another user transferring the restricted users calls off-switch on their behalf. Note that a number of other controls may inhibit the transfer operation.                                                                                                                                                                                                           |
| <b>Can Intrude</b>                          | Default = Off <br>If enabled, the user can perform is allowed to perform a range of action on other user's calls. For example: <b>Call Intrude</b> , <b>Call Listen</b> , <b>Call Steal</b> and <b>Dial Inclusion</b> . See <a href="#">Call Intrusion</a> on page 838.<br><ul style="list-style-type: none"><li>• Use of the features is subject to the <b>Cannot Be Intruded</b> setting of the target.</li></ul> |
| <b>Cannot be Intruded</b>                   | Default = On <br>If checked, this user's calls cannot be interrupted or acquired by users who have <b>Can Intrude</b> enabled. This setting also affects whether other users can use their appearance buttons to bridge into a call to which this user has been the longest present user.                                                                                                                         |
| <b>Can Trace Calls</b>                      | Default = Off. This settings controls whether the user is able to make used of ISDN MCID controls.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Can Control After Call Work</b>          | Default = Off.<br>If enabled, the agent can extend the currently active After Call Work time indefinitely.                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>After Call Work Time (Sec)</b>           | Default = The value in this field is populated from the <b>Default After Call Work Time</b> field located at <b>System   Contact Center</b> .<br>The time after a call when an agent is busy and unable to deal with hunt group calls. Change the value if you want to specify ACW time for this user to be different from the system default.                                                                                                                                                       |
| <b>Can Accept Collect Calls</b>             | Default = Off [Brazil Only]<br>Determines whether the user is able to receive and accept collect calls.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Deny Auto Intercom Calls</b>             | Default = Off.<br>When enabled, any automatic intercom calls to the user's extension are automatically turned into normal calls.                                                                                                                                                                                                                                                                                                                                                                     |

**Additional configuration information**

- For additional configuration information, see [Appearance Button Operation](#) on page 1202.
- For the **Reserve Last CA** setting, 1400, 1600, 9500 and 9600 Series telephone users can put a call on hold pending transfer if they already have held calls even if they have no free call appearance button available. For additional information, see [Context Sensitive Transfer](#) on page 907.

**Configuration settings**

Multi-line options are applied to a user's phone when the user is using an Avaya phones which supports appearance buttons (call appearance, line appearance, bridged and call coverage).

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                                  | Description                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Individual Coverage Time (secs)</b> | Default = 10 seconds, Range 1 to 99999 seconds. <br>This function sets how long the phone will ring at your extension before also alerting at any call coverage users. This time setting should not be equal to or greater than the <b>No Answer Time</b> applicable for the user. |
| <b>Ring Delay</b>                      | Default = Blank (Use system setting). Range = 0 (use system setting) to 98 seconds.<br>This setting is used when any of the user's programmed appearance buttons is set to Delayed ringing. Calls received on that button will initially only alert visually. Audible alerting will only occur after the ring delay has expired.                                     |

## Telephony Call Log

Navigation: **Call Management > Users > Add/Edit Users > Telephony > Call Log**

The IP Office stores a centralized call log for each user:

- The user's centralized call log is stored by the IP Office system on which the user is configured. If the user is logged in on another system, new call log records are sent to the user's home IP Office system, but using the time and date on the IP Office system where the user is logged in.
- Each user's centralized call log can contain 30 (IP500 V2) or 60 (Server Edition) call records. Each new call record replaces the oldest previous record when it reaches the limit.
- By default, the centralized call log is displayed on Avaya phones with a fixed **Call Log** or **History** button (1400, 1600, 9400, 9500, 9600, and J100 Series) and in the one-X Portal, Avaya Workplace Client, and IP Office User Portal applications.
- The centralized call log moves with the user as they log onto different phones and IP Office applications.
- The missed call count is updated per unique caller, not per call.

These settings are using in conjunction with the system wide call log settings (**System > Telephony > Call Log**).

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Short Codes

Navigation: **Call Management > Users > Add/Edit Users > Short Codes**

### Additional configuration information

For additional configuration information on short codes, see [Short Code Overview](#) on page 977.

## Configuration settings

Short codes entered in this list can only be dialed by the user. They will override any matching user rights or system short code.

User and User Rights short codes are only applied to numbers dialed by that user. For example they are not applied to calls forwarded via the user.

### Warning:

User dialing of emergency numbers must not be blocked by the addition of short codes. If short codes are added, the users ability to dial emergency numbers must be tested and maintained.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

Short codes can be added and edited using the **Add**, **Remove** and **Edit** buttons. Alternatively you can right-click on the list of existing short code to add and edit short codes.

| Code                             | Description                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| *FWD                             | Short codes of this form are inserted by the system. They are used in conjunction with the <b>User   Forwarding</b> settings to remember previously used forwarding numbers. They can be accessed on that tab by using the drop-down selector on the forwarding fields.                                                                                                                                                 |
| *DCP                             | Short codes of this form are often inserted by the system. They are used by some phone types to contain settings relating to functions such as ring volume and auto answer. Deleting such short codes will cause related phone settings to return to their defaults.                                                                                                                                                    |
| *DCP/Dial/<br>8xxxxxxx,0,1,1,0/0 | For systems with TCM phone ports, when a phone is first connected to the port, the button programming of the associated user is overwritten with the default button programming appropriate for the phone model. Adding the above short code prevents that behavior if not required, for example if a pre-built configuration including user button programming is added to the system before the connection of phones. |

## Forwarding

Navigation: **Call Management > Users > Add/Edit Users > Forwarding**

Use this page to check and adjust a user's call forwarding and follow me settings. For additional configuration information, see [DND, Follow Me, and Forwarding](#) on page 866.

Follow Me is intended for use when the user is present to answer calls but for some reason is working at another extension. For example; temporarily sitting at a colleague's desk or in another office or meeting room. As a user, you would use Follow Me instead of Hot-Desking if you do not

have a log in code or you do not want to interrupt you colleague also receiving their own calls. Multiple users can use follow me to the same phone.

Forwarding is intended for use when, for some reason, the user is unable to answer a call. They may be busy on other calls, unavailable or simply do not answer. Calls may be forwarded to internal or, subject to the user's call barring controls, external numbers.

- **To bar a user from forwarding calls to an external number:** Select **Call Management > Users > Add/Edit Users > Telephony > Supervisor Settings > Inhibit Off-Switch Forward/Transfers**.
- **To bar all users from forwarding calls to external numbers:** Select **System Settings > System > Telephony > Inhibit Off-Switch Forward/Transfers**.

Note that analog lines do not provide call progress signalling. Therefore, calls forwarded off-switch via an analog line are treated as answered and are not recalled.

Once a call has been forwarded to an internal target, it will ignore the target's **Forward No Answer** or **Forward on Busy** settings but may use its **Forward Unconditional** settings unless they create a loop.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

### General Settings

| Field                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Block Forwarding</b> | <p>Default = Off. </p> <p>When enabled, call forwarding is blocked for this user. The following actions are blocked: Follow me, Forward unconditional, Forward on busy, Forward on no answer and Hot Desking.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Follow Me Number</b> | <p>Default = Blank. Range = Internal extension number.</p> <p>Redirects the user's calls to the internal extension number entered. If the redirected call receives busy or is not answered, it follows the user's forwarding and or voicemail settings as if it had been presented to their normal extension. When a user has follow me in use, their normal extension will give alternate dialtone when off hook. Using <b>Follow Me</b> overrides <b>Forward Unconditional</b>.</p> <p>Calls targeting longest waiting type hunt groups ignore Follow Me.</p> <p>Calls triggered by actions at the user's original extension, for example voicemail ringback, ignore Follow Me.</p> <p>Park, hold and transfer return calls will go to the extension at which the user initiated the park, hold or transfer action.</p> |

## Forward Unconditional

| Field                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Forward Unconditional</b> | <p>Default = Off</p> <p>This option, when checked and a <b>Forward Number</b> also set, forwards all external calls immediately. Additional options allow this forwarding to also be applied to internal calls and to hunt group calls if required. When a user has forward unconditional in use, their normal extension will give alternate dialtone when off hook. If the destination is an internal user on the same system, they are able to transfer calls back to the user, overriding the Forward Unconditional.</p> <p>After being forwarded for the user's no answer time, if still unanswered, the system can apply additional options. It does this if the user has forward on no answer set for the call type or if the user has voicemail enabled.</p> <ul style="list-style-type: none"> <li>• If the user has forward on no answer set for the call type, the call is recalled and then forwarded to the forward on no answer destination.</li> <li>• If the user has voicemail enabled, the call is redirected to voicemail.</li> <li>• If the user has both options set, the call is recalled and then forwarded to the forward on no answer destination for their no answer time and then if still unanswered, redirected to voicemail.</li> <li>• If the user has neither option set, the call remains redirected by the forward unconditional settings.</li> </ul> <p>Note that for calls redirected via external trunks, detecting if the call is still unanswered requires call progress indication. For example, analog lines do not provide call progress signalling and therefore calls forwarded via an analog lines are treated as answered and not recalled.</p> |
| <b>To Voicemail</b>          | <p>Default = Off.</p> <p>If selected and forward unconditional is enabled, calls are forwarded to the user's voicemail mailbox. The <b>Forward Number</b> and <b>Forward Hunt Group Calls</b> settings are not used. This option is not available if the system's <b>Voicemail Type</b> is set to <b>None</b>. 1400, 1600, 9400, 9500, and 9600 Series phone users can select this setting through the phone menu. Note that if the user disables forward unconditional the <b>To Voicemail</b> setting is cleared.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Forward Number</b>        | <p>Default = Blank. Range = Internal or External number. Up to 33 characters.</p> <p>This option sets the destination number to which calls are forwarded when <b>Forward Unconditional</b> is checked. The number can be an internal or external number. This option is also used for <b>Forward on Busy</b> and <b>Forward on No Answer</b> if no separate <b>Forward Number</b> is set for those features. If a user forwards a call to a hunt group of which they are a member, the group call is not presented to them but is presented to other members of the hunt group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Field                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Forward Hunt Group Calls</b> | <p>Default = Off</p> <p>Hunt group calls (internal and external) are not normally presented to a user who has forward unconditional active. Instead they are presented to the next available member of the hunt group. This option, when checked, sets that hunt group calls (internal and external) are also forwarded when forward unconditional is active. The group's <b>Ring Type</b> must be <b>Sequential</b> or <b>Rotary</b>, not <b>Collective</b> or <b>Longest Waiting</b>. The call is forwarded for the period defined by the hunt group's <b>No Answer Time</b> after which it returns to the hunt group if unanswered. Note also that hunt group calls cannot be forwarded to another hunt group.</p> |
| <b>Forward Internal Calls</b>   | <p>Default = On.</p> <p>This option, when checked, sets that internal calls should be also be forwarded immediately when forward unconditional is active.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### Forward on Busy/No Answer

| Field                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Forward On Busy</b>        | <p>Default = Off</p> <p>When checked and a forward number is set, external calls are forwarded when the user's extension is busy. The number used is either the <b>Forward Number</b> set for <b>Forward Unconditional</b> or if set, the separate <b>Forward Number</b> set under <b>Forward On Busy</b>. Having <b>Forward Unconditional</b> active overrides <b>Forward on Busy</b>.</p> <p>If the user has <b>Busy on Held</b> selected, if forward on busy is active it is applied when the user is free to receive calls but already has a call on hold.</p> <p>If the user's phone has multiple call appearance buttons, the system will not treat them as busy until all the call appearance buttons are in use unless the last appearance button has been reserved for outgoing calls only.</p> |
| <b>Forward On No Answer</b>   | <p>Default = Off When checked and a forward number is set, calls are forwarded when the user does not answer within their set No Answer Time (User   Telephony   Call Settings).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Forward Number</b>         | <p>Default = Blank. Range = Internal or External number. Up to 33 characters.</p> <p>If set, this number is used as the destination for <b>Forward On Busy</b> and <b>Forward On No Answer</b> when on. If not set, the <b>Forward Number</b> set for <b>Forward Unconditional</b> is used. If a user forwards a call to a hunt group of which they are a member, the group call is not presented to them but is presented to other members of the hunt group.</p>                                                                                                                                                                                                                                                                                                                                       |
| <b>Forward Internal Calls</b> | <p>Default = On. When checked, this option sets that internal calls should be also be forwarded when forward on no answer or forward on busy is active.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

# Mobility

Navigation: **Call Management > Users > Add/Edit Users > Mobility**

These settings can be edited online. Changes to these settings do not require a reboot of the system.

## Configuration settings

Twinning allows the IP Office to present a user's calls to both their main phone and another extension or number. The IP Office system supports two modes of twinning:

|                             | Internal                                        | Mobile                 |
|-----------------------------|-------------------------------------------------|------------------------|
| <b>Twinning Destination</b> | Internal extensions on the same IP Office.      | External numbers only. |
| <b>Supported in</b>         | All locales.                                    | All locales.           |
| <b>License Required</b>     | The primary phone user must be a licensed user. | Yes                    |

## Using both internal and mobile twinning

For IP Office R11.1.3 and higher, you can configure both **Internal Twinning** and **Mobile Twinning** for Avaya Workplace Client users:

- The Avaya Workplace Client users can switch between internal and mobile twinning using the client's **Incoming Call Features** menu.
- When the Avaya Workplace Client user selects mobile twinning, the internal twinning extension temporarily reverts to its original extension number. Therefore, Avaya recommend restricting the internal twin extension to internal calls when not twinned.

## Simultaneous

These settings apply to the operation of simultaneous clients.

| Field                        | Description                                                                                                                                                                                                                                                                                                                   |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Coverage Delay (secs)</b> | Default = 0 seconds. Range= minimum 0 seconds to maximum 15 seconds.<br>Sets the delay between calls alerting on the user's main telephony device/client and then also alerting their MS Teams client.                                                                                                                        |
| <b>MS Teams URI</b>          | The user's telephony URI for MS Teams. The maximum length of the URI is 161 characters. For more details, see the <i>Deploying MS Teams Direct Routing with IP Office</i> manual.<br><br>This field is read-only if the <b>Auto Populate MS Teams Data</b> setting ( <b>System &gt; Telephony &gt; MS Teams</b> ) is enabled. |

## Internal Twinning

Select this option to enable internal twinning for a user. Internal twinning is not supported during resilience.

| Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Twinned Handset</b>           | <p>Default = Blank.</p> <p>This drop-down list is used to select twinned phone. Supported internal twinning destinations must:</p> <ul style="list-style-type: none"> <li>• Be on the same IP Office system</li> <li>• Not be using simultaneous mode.</li> <li>• Be a physical deskphone or DECT extension. Softphones are not supported.</li> </ul> <p>If the list is grayed out, the user is a twinning destination and the main phone to which it is twinned is displayed.</p> <p>All <b>Call Management &gt; Users &gt; Add/Edit Users &gt; Mobility</b> fields are grayed out for unlicensed users.</p> |
| <b>Maximum Number of Calls</b>   | <p>Default = 1.</p> <p>Sets the number of calls the user can have internally twinned at the same time:</p> <ul style="list-style-type: none"> <li>• If set to one, when either the main or twinned phone are in use, any additional incoming call receives busy treatment.</li> <li>• If set to two, when either phone is in use, it receives call waiting indication for the second call. Any further calls above two receive busy treatment.</li> </ul>                                                                                                                                                     |
| <b>Twin Bridge Appearances</b>   | <p>Default = Off.</p> <p>Set whether calls alerting on bridged appearance buttons on the main phone also alert on the twinned phone.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Twin Coverage Appearances</b> | <p>Default = Off.</p> <p>Set whether calls alerting on coverage appearance buttons on the main phone also alert on the twinned phone.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Twin Line Appearances</b>     | <p>Default = Off.</p> <p>Set whether calls alerting on line appearance buttons on the main phone also alert on the twinned phone.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Mobility Features

If enabled, this option allows any of the mobility features to be enabled for the user.

| Field                    | Description                                                                                                                                                                                                                                                                         |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mobile Twinning</b>   | If selected, the user is enable for mobile twinning. The user can control this option through a <b>Twinning</b> programmable button on their a phone.                                                                                                                               |
| <b>Fallback Twinning</b> | <p>Default = Disabled</p> <p>When enabled, if the user's main extension is unreachable, the IP Office redirects their calls to the <b>Twinned Mobile Number</b> even if <b>Mobile Twinning</b> is disabled. <b>Fallback Twinning</b> does not use the <b>Mobile Dial Delay</b>.</p> |

Navigation: **Call Management > Users > Add/Edit Users > Voicemail Recording**

These settings are used to control manual and automatic recording of user's calls.

- Call recording requires Voicemail Pro to be installed and running. Call recording also requires available conference resources similar to a 3-way conference.
- Call recording starts when the call is answered.
- Call recording is paused when the call is parked or held. It restarts when the call is unparked or taken off hold. This does not apply to SIP terminals.
- Calls to and from IP devices, including those using Direct media, can be recorded.
- Recording continues for the duration of the call or up to the maximum recording time configured on the voicemail server.
- Recording is stopped when the call ends or if:
  - User call recording stops if the call is transferred to another user.
  - Account code call recording stops if the call is transferred to another user.
  - Hunt group call recording stops if the call is transferred to another user who is not a member of the hunt group.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

## Auto Recording

| Field               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Do Not Disturb

Navigation: **Call Management > Users > Add/Edit Users > Do Not Disturb**

### Additional configuration information

For additional configuration information, see [DND, Follow Me, and Forwarding](#) on page 866.

See Do Not Disturb in the Telephone Features section for full details of Do Not Disturb operation.

Do not disturb prevents the user from receiving hunt group and page calls. Direct callers hear busy tone or are diverted to voicemail if available. It overrides any call forwarding, follow me and call coverage settings. A set of exception numbers can be added to list numbers from which the user still wants to be able to receive calls when they have do not disturb in use.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Do Not Disturb</b> | <p>Default = Off </p> <p>When checked the user's extension is considered busy, except for calls coming from sources listed in their Do Not Disturb Exception List. When a user has do not disturb in use, their normal extension will give alternate dialtone when off hook. Users with DND on are indicated as 'busy' on any BLF indicators set to that user.</p> |

## Announcements

Navigation: **Call Management > Users > Add/Edit Users > Announcements**

Announcements are played to callers waiting to be answered. This includes callers being presented to hunt group members, ie. ringing, and callers queued for presentation.

- The system supports announcements using Voicemail Pro or Embedded Voicemail.
- If no voicemail channel is available for an announcement, the announcement is not played.
- In conjunction with Voicemail Pro, the system allows a number of voicemail channels to be reserved for announcements. See **System Settings > System > Voicemail**.
- With Voicemail Pro, the announcement can be replaced by the action specified in a Queued (1st announcement) or Still Queued (2nd announcement) start point call flow. Refer to the Voicemail Pro Installation and Maintenance documentation for details.
- Calls can be answered during the announcement. If it is a mandatory requirement that announcements should be heard before a call is answered, then a Voicemail Pro call flow should be used before the call is presented.

#### **Note:**

##### Call Billing and Logging

A call becomes connected when the first announcement is played to it. That connected state is signaled to the call provider who may start billing at that point. The call will also be recorded as answered within the SMDR output once the first announcement is played.

- If a call is rerouted, for example forwarded, the announcement plan of the original user is still applied until the call is answered. The exception is calls rerouted to a hunt group at which point the hunt group announcement settings are applied.
- For announcements to be used effectively, either the user's no answer time must be extended beyond the default 15 seconds or Voicemail On should be deselected.

## Recording Announcements

### Voicemail Pro:

There is no mechanism within the telephony user interfaces (TUI) to record user announcements. To provide custom announcements, user queued and still queued start points must be configured with Voicemail Pro with the required prompts played by a generic action.

### Embedded Voicemail:

Embedded Voicemail does not include any default announcement or method for recording an announcement. The Record Message short code feature is provided to allow the recording of announcements. The telephone number field of short codes using this feature requires the extension number followed by either ".1" for announcement 1 or ".2" for announcement 2. For example, for extension number 300, the short codes **\*91N# | Record Message | N".1"** and **\*92N# | Record Message | N".2"** could be used to allow recording of the announcements by dialing **\*91300#** and **\*92300#**.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                                | Description                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Announcements On</b>              | Default = Off.<br>This setting enables or disables announcements.                                                                                                                                                                                                                                                                               |
| <b>Wait before 1st announcement:</b> | Default = 10 seconds. Range = 0 to 255 seconds.<br>This setting sets the time delay from the calls presentation, after which the first announcement should be played to the caller.                                                                                                                                                             |
| <b>Flag call as answered</b>         | Default = Off.<br>This setting is used by the CCC and CBC applications. By default they do not regarded a call as answered until it has been answered by a person or by a Voicemail Pro action with <b>Flag call as answered</b> selected. This setting allows calls to be marked as answered once the caller has heard the first announcement. |
| <b>Post announcement tone</b>        | Default = Music on hold.<br>Following the first announcement, you can select whether the caller should hear Music on Hold, <b>Ringing</b> or <b>Silence</b> until answered or played another announcement.                                                                                                                                      |
| <b>2nd Announcement</b>              | Default = On.<br>If selected, a second announcement can be played to the caller if they have still not been answered.                                                                                                                                                                                                                           |
| <b>Wait before 2nd announcement</b>  | Default = 20 seconds. Range = 0 to 255 seconds.<br>This setting sets the wait between the 1st and the 2nd announcement.                                                                                                                                                                                                                         |
| <b>Repeat last announcement</b>      | Default = On.<br>If selected, the last announcement played to the caller is repeated until they are answered or hang-up.                                                                                                                                                                                                                        |
| <b>Wait before repeat</b>            | Default = 20 seconds. Range = 0 to 255 seconds.<br>If <b>Repeat last announcement</b> is selected, this setting sets is applied between each repeat of the last announcement.                                                                                                                                                                   |

# Personal Directory

Navigation: **Call Management > Users > Add/Edit Users > Personal Directory**

Each user is able to have up to 250 personal directory records up to the overall system limit. Those records are used as follows:

- When using M-Series, T-Series, 1400, 1600, 9400, 9500, 9600, or J100 Series phones, the user is able to view and call their personal directory numbers.
- When using a 1400, 1600, 9400, 9500, 9600, or J100 Series phone, the user is also able to edit and add personal directory records.
- On phones that support hot desking on the same system or to another system in a multi-site network, the user can still access their personal directory.

Users are able to view and edit their personal directory through their phone. Directory records are used for dialing and caller name matching.

## Directory Dialing

Directory numbers are displayed by user applications such as SoftConsole. Directory numbers are viewable through the Dir function on many Avaya phones (**Contacts** or **History**). They allow the user to select the number to dial by name. The directory will also contain the names and numbers of users and hunt groups on the system.

The **Dir** function groups directory records shown to the phone user into the following categories. Depending on the phone, the user may be able to select the category currently displayed. In some scenarios, the categories displayed may be limited to those supported for the function being performed by the user:

- **External** - Directory records from the system configuration. This includes HTTP and LDAP imported records.
- **Groups** - Groups on the system. If the system is in a multi-site network, it will also include groups on other systems in the network.
- **Users** or **Index** - Users on the system. If the system is in a multi-site network it will also include users on other systems in the network.
- **Personal** - Available on 1400, 1600, 9400, 9500, 9600, and J100 Series phones. These are the user's personal directory records stored within the system configuration.

## Speed Dialing

On M-Series and T-Series phones, a Speed Dial button or dialing **Feature 0** can be used to access personal directory records with an index number.

- **Personal**: Dial **Feature 0** followed by \* and the 2-digit index number in the range 01 to 99.
- **System**: Dial **Feature 0** followed by 3-digit index number in the range 001 to 999.

- The Speed Dial short code feature can also be used to access a directory speed dial using its index number from any type of phone.

### Caller Name Matching

Directory records are also used to associate a name with the dialed number on outgoing calls or the received CLI on incoming calls. When name matching is being done, a match in the user's personal directory overrides any match in the system directory. Note that some user applications also have their own user directory.

SoftConsole applications have their own user directories which are also used by the applications name matching. Matches in the application directory may lead to the application displaying a different name from that shown on the phone.

Name matching is not performed when a name is supplied with the incoming call, for example QSIG trunks. On SIP trunks the use of the name matching or the name supplied by the trunk can be selected using the setting **System Settings > System > Telephony > Default Name Priority**. This setting can also be adjusted on individual SIP lines to override the system setting.

Directory name matching is not supported for DECT handsets. For information on directory integration, see *Deploying Avaya Wireless DECT with IP Office*.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Index</b>  | Range = 00 to 99 or None.<br><br>This value is used with personal speed dials set and dialed from M and T-Series phones. The value can be changed but each value can only be applied to one directory record at any time. Setting the value to <b>None</b> makes the speed dial inaccessible from M and T-Series phones, however it may still be accessible from the directory functions of other phones and applications. The Speed Dial short code feature can be used to create short codes to dial the number stored with a specific index value. Release 10.0 allows users to have up to 250 personal directory entries. However, only 100 of those can be assigned index numbers. |
| <b>Name</b>   | Range = Up to 31 characters.<br><br>Enter the text to be used to identify the number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Number</b> | Range = Up to 31 digits plus * and #. Enter the number, without spaces, to be dialed. Wildcards are not supported in user personal directory records. Note that if the system has been configured to use an external dialing prefix, that prefix should be added to directory numbers.                                                                                                                                                                                                                                                                                                                                                                                                  |

## SIP

Navigation: **Call Management > Users > Add/Edit Users > SIP**

This tab is available when either of the following has been added to the configuration:

- an **IP Office Line**
- a SIP trunk with a SIP URI record containing a field that has been set to **Use Internal Data**.

Various fields within the URI settings used by SIP trunks can be set to **Use Internal Data**. When that is the case, the values from this tab are used into the URI when the user makes or receives SIP calls. Within a multi-site network, that includes calls which break out using a SIP trunk on another system within the network.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Menu Programming

Navigation: **Call Management > Users > Add/Edit Users > Menu Programming**

This tab is used to set and lock the user's programmable button set.

When **Apply User Rights value** is selected, the tab operates in the same manner as the User | Menu Programming tab.

For a Server Edition network, these settings can be configured at the network level and are then automatically replicated in the configuration of all systems in the network. They can only be seen and edited at the individual system configuration level if record consolidation is switched off.

## Menu Programming — T3 Telephony

Navigation: **Call Management > Users > Edit > Advanced > Menu Programming > T3 Telephony**

These settings are applied to the user when they are using a T3 phone.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

### Configuration Settings

**Third Party Forwarding** Avaya T3 phone users can be given menu options to change the forwarding settings of other users. In addition to the following controls, this functionality is protected by the forwarding user's log in code.

- **Allow Third Party Forwarding:** Default = Off Sets whether this user can change the forwarding settings of other users.
- **Protect from Third Party Forwarding:** Default = Off Sets whether this user's forwarding settings can be changed by other users.

### Advice of Charge

**Display Charges:** Default = On. This setting is used to control whether the user sees ISDN AOC information when using a T3 phone.

**Allow Self Administer:** Default = Off. If selected, this option allows the user to self-administer button programming.

## Menu Programming — Hunt Group

Navigation: **Call Management > Users > Edit > Advanced > Menu Programming > Hunt Group**

Avaya T3, 1400, 1600, 9400, 9500, and 9600 Series phone users can control various settings for selected hunt groups. These settings are also used for one-X Portal for IP Office.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

## Configuration Settings

**Can Change Membership:** Default = Off This list shows the hunt groups of which the user is a member. Up to 10 of these groups can be checked; those group and the users current membership status are then displayed on the phone. The user can change their membership status through the phone's menus.

T3 Series Phones: The selected hunt groups and the user's current membership status are displayed on the T3 phones status display. That display can be used to change the status.

**Can Change Service Status:** Default = Off This list shows all the hunt groups on the system. Up to 10 of these groups can be checked.

T3 Series Phones:

The user is then able to view and change the service status of the checked groups through their T3 phones menus (**Menu | Group State**).

In addition to changing the status of the individual hunt groups displayed via **Menu | Group State**, the menu also displays option to change the status of all the groups; **All in service**, **All night service** and **All out service**.

**Can Change Night Service Group:** Default = Off. If selected, the user can change the fallback group used when the hunt group is in Night Service mode.

**Can Change Out of Service Group:** Default = Off. If selected, the user can change the fallback group used when the hunt group is in Out of Service mode.

## Menu Programming — 4400/6400

Navigation: **Call Management > Users > Edit > Advanced > Menu Programming > 4400/6400**

4412, 4424, 4612, 4624, 6408, 6416 and 6424 phones have a **Menu** key, sometimes marked with an  icon. When **Menu** is pressed, a number of default functions are displayed. The < and > keys can be used to scroll through the functions while the keys below the display can be used to select the required function.

The default functions can be overwritten by selections made within this tab.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

### Configuration Settings

**Menu No.** The menu position which the function is being set.

**Label** This is a text label for display on the phone. If no label is entered, the default label for the selected action is used. Labels can also be changed through the menu on some phones, refer to the appropriate telephone user guide.

**Action** Defines the action taken by the menu button.

**Action Data** This is a parameter used by the selected action. The options here will vary according to the selected button action.

## Source Numbers

Navigation: **Call Management > Users > Add/Edit Users > Source Numbers**

Source numbers are used to configure features which do not have specific controls within the IP Office Manager or IP Office Web Manager interfaces. For more details, see [User Source Numbers](#) on page 917.

Sources numbers are divided into two types:

- User source numbers are used to apply settings to individual users.
- NoUser source numbers are used to apply settings to the IP Office system or to all users on the system.

## User Settings Access

These options control the options that the user can access within self-administration and the type of access they have. For each set of options, the user can be given the following access:

- **No Access** - The user cannot access the related menu and its settings.
- **Read Access** - The user can view the settings on the menu but cannot change them.
- **Write Access** - The user can both view and change the settings on the menu.

| Name                         | Description                                                                                                                                                                                                      |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Profile</b>               | This menu provides the access to details such as full name, voicemail and login code and email address.                                                                                                          |
| <b>Call Handling</b>         | This menu provides access to call controls such as forwarding, do not disturb and twinning.                                                                                                                      |
| <b>Personal Directory</b>    | This menu provides access to the user's personal directory entries.                                                                                                                                              |
| <b>Button Programming</b>    | This option allows the user to assign features to programmable buttons on their phone and to change button labels. They still cannot override the settings of appearance buttons and buttons set by user rights. |
| <b>Download Applications</b> | This option display a menu of links for user applications that work with IP Office. Note that the user may require further configuration to use a specific application.                                          |

### Media Manager Replay Self-Administration

These settings control the users rights to play call recordings stored by Media Manager or Centralized Media Manager.

| Name                                | Description                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enable Media Manager Replay</b>  | Default = Off.<br><br>When enabled, the user can replay call recordings through web self-administration.<br><br><ul style="list-style-type: none"> <li>• Note: For users where Media Manager is provided by a separate application server, recordings are viewed and accessed using the address of the application server rather than that of the IP Office system.</li> </ul>     |
| <b>Replay All Recordings</b>        | If selected, the user can view and replay all recordings.                                                                                                                                                                                                                                                                                                                          |
| <b>Replay Own Recordings</b>        | If selected, the user can view and replay their own call recordings. When enabled, the <b>Replay Recordings For Group</b> and <b>Replay Recordings For Others</b> options are also available.                                                                                                                                                                                      |
| <b>Replay Recordings For Group</b>  | These menus allows the selection of groups for which the user is able to view and replay recordings.                                                                                                                                                                                                                                                                               |
| <b>Replay Recordings For Others</b> | The field can be used to enter a list of numbers, separated by semi-colons, for which the user can view and playback recordings. Those numbers can be accounts codes, line numbers, user extensions and group extension numbers. The list can be 127 characters in length.                                                                                                         |
| <b>Download Recordings</b>          | If selected, the user is able to download recordings as a separate file.<br><br><ul style="list-style-type: none"> <li>• Downloaded files are outside of the control of the system. Therefore, if you allow users to download files, it is your responsibility to ensure that they comply with local privacy and data protection laws regarding the use of those files.</li> </ul> |

### Historical Call Reporting

Call reporting allows the user to view a summary of recent calls by all users. This is currently a trial feature. It is only supported with subscription mode systems. The system must have its **System > SMDR** set to **Hosted Only**.

| Name                                    | Description                                                                                                                                                                              |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enable Historical Call Reporting</b> | Default = Off.<br><br>When enabled, the user can access the call reporting menus through their user portal.<br>For details, refer to <i>Using the IP Office Embedded Call Reporter</i> . |

### User Portal Softphone Remote Access Notes

Non-IP500 V2 IP Office systems can support the user portal as a WebRTC softphone. When operating as a remote extension, this may require the following:

- The IP Office and user portal to use STUN.
- Connection using an SBC configured for TURN.

For details, see the **System > LAN1 > Network Topology > WebRTC** settings.

# Chapter 15: Extension

Navigation: **Call Management > Extensions**

## Main content pane

The **Extensions** main content pane lists provisioned extensions. The contents of the list depends on the filter option selected. Click the icons beside a record to edit or delete.

**Bulk delete:** You can delete multiple records. Select the check box to the right of each record you want to delete and click **Delete**. You receive a prompt to confirm the deletion.

Click **Actions** for extension template management.

Click **Add/Edit Extension** to select an extension type to add. When you click **Add/Edit Extension**, you are prompted to specify the system where the extension will be added.

## Extension Filters

| Filter                | Description                                                |
|-----------------------|------------------------------------------------------------|
| <b>Show All</b>       | List all provisioned extensions on all systems.            |
| <b>Systems</b>        | List all provisioned extensions on specific systems.       |
| <b>Extension Type</b> | List a specific provisioned extension type on all systems. |

[Create From Template](#) on page 213

[Provision Extensions](#) on page 213

## Create From Template

Navigation: **Call Management > Extensions > Actions > Create From Template**

Use this page to add extensions using a template. You can define extension templates by selecting **Call Management > Extensions > Actions > Template Management**.

When you click **Create From Template** and then select a server, the Select Template window opens.

Once you have defined the settings below and click **OK**, the Provision Extensions page opens.

| Field                           | Description                                     |
|---------------------------------|-------------------------------------------------|
| <b>Enter number of records</b>  | Enter the number of records you want to create. |
| <b>Enter starting extension</b> | Enter the extension number of the first record. |
| <b>Select Template</b>          | Select a template from the list.                |

[Extension Template Management](#) on page 212

## Provision Extensions

Navigation: **Call Management > Extensions > Actions > Create From Template > Select Template > Provision Extensions**

This page displays the extension records that will be created based on the values entered in the Select Template window.

At the top of the page, the **Preview Extensions Data** area indicates the server on which the users will be created, the number of records (**Total Records Read**) and the **Records with Error**.

The table lists the user records that will be created and the values that have been populated based on the template. You can remove records from the list using **Delete Selected Records**. You can modify the display by turning **Show Error Records** on or off.

When you are ready to create the new extension records, click **Create**.

## Extension Common Fields

Navigation: **Call Management > Extensions > Edit Extension > Common**

### Additional configuration information

The Caller Display Type setting controls the presentation of caller display information. For additional configuration information, see [Caller Display](#) on page 743.

This type of configuration record can be saved as a template and new records created from a template. See [Working with Templates](#) on page 810.

### Configuration Settings

These settings can be edited online except **Base Extension** and **Caller Display Type**. Changes to those settings require a reboot of the system. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

| Field               | Description                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>Extension ID</b> | The physical ID of the extension port. Except for IP extensions, this settings is allocated by the system and is not configurable. |

*Table continues...*

| Field                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |      |             |            |                          |           |                                                                                                                                                                                                                                                                                                                                                                     |           |                                                                      |             |                                                                               |              |                                                           |              |                                                       |              |                                                           |              |                                                                                                                                                                                                                                                                                                   |              |                                                           |             |                                                                |             |                                                                    |             |                                                                   |             |                                                     |

| <b>DTMFF</b>               | Sends the called number in DTMF after call connection. Number only. Used for fax servers. When calls are delivered via a hunt group, it is recommended that hunt group queuing is not used. If hunt group queuing is being used, set the <b>Queue Type</b> to <b>Assign Call on Agent Alert</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |      |             |            |                          |           |                                                                                                                                                                                                                                                                                                                                                                     |           |                                                                      |             |                                                                               |              |                                                           |              |                                                       |              |                                                           |              |                                                                                                                                                                                                                                                                                                   |              |                                                           |             |                                                                |             |                                                                    |             |                                                                   |             |                                                     |

| <b>Location</b>                 | <p>The drop down list contains all locations that have been defined on the system: <b>System Settings &gt; Locations</b>. See <a href="#">Using Locations</a> on page 743.</p> <p>Associating an extension with a location:</p> <ul style="list-style-type: none"> <li>Allows emergency call routing using settings specific to that location.</li> <li>Allows the display of location based time. Supported on 1100, 1200, 1600, 9600 and J100 Series phones and D100, E129 and B179 telephones.</li> <li>For Avaya Wireless DECT extensions, the extension location can be overridden on a call-by-call basis using the location name specified in the base station configuration. Supported with R11.1 FP2 SP2 and higher. This requires you to set <b>Call based Location Information</b> on the IP DECT line and to configure each base station with a location name that matches one in the IP Office configuration.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |              |                       |              |                                                |              |                       |              |                               |                  |                  |              |                |

| Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Fallback as Remote Worker</b> | <p>Default = Auto.</p> <p>Determines what fallback address is used for Remote Worker phone resiliency.</p> <p>The options are:</p> <ul style="list-style-type: none"> <li>• <b>Auto</b>: Use the fallback address configured on the IP Office Line providing the service.</li> <li>• <b>No</b>: Use the alternate gateway private address.</li> <li>• <b>Yes</b>: Use the alternate gateway public address.</li> </ul>                                                                                                                                                                                                                                                                  |
| <b>Module</b>                    | <p>This field indicates the external expansion module on which the port is located. <b>BP</b> indicates an analog phone extension port on the base or control unit. <b>BD</b> indicates a digital station (DS) port on the control unit. For an IP500 V2 control unit, <b>BD</b> and <b>BP</b> is also followed by the slot number. VoIP extensions report as <b>0</b>.</p>                                                                                                                                                                                                                                                                                                             |
| <b>Port</b>                      | <p>This field indicates the port number on the <b>Module</b> indicated above. VoIP extensions report as <b>0</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Disable Speakerphone</b>      | <p>Default = Off (Speakerphone enabled).</p> <p>When selected, disables the fixed <b>SPEAKER</b> button if present on the phone using this extension port. Only supported on Avaya DS, TCM and H.323 IP phones. An audible beep is sounded when a disabled <b>SPEAKER</b> button is pressed. Incoming calls such as pages and intercom calls are still connected but the speech path is not audible until the user goes off-hook using the handset or headset. Similarly calls made or answered using other buttons on the phone are not audible unless the user goes off-hook using the handset or headset. Currently connected calls are not affected by changes to this setting.</p> |

## Analog

Navigation: **Call Management > Extensions > Edit Extension > Analog**

This tab contains settings that are applicable to analog extensions. These extensions are provided by ports marked as **POT** or **PHONE** on control units and expansion modules.

These settings are not mergeable. Changes to these settings will require a reboot of the system.

#### Equipment Classification:

| Field | Description                                                                                                                             |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------|
|       | <p>Default = Standard Telephone.</p> <p>Only available for analog extension ports. Note that changes to this setting are mergeable.</p> |

| Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Quiet Headset</b>             | <p>On extensions set to <b>Quiet Headset</b>, the audio path is disabled when the extension is idle. Ringing is presented in the audio path. Caller ID is not supported on the phone.</p> <p>This option can be used with analog extensions where the handset is replaced by a headset and all audio, including ringing should be through the headset.</p> <p>Since the audio path is disabled when idle, the <b>Quiet Headset</b> extension cannot dial digits to make calls. Therefore, to make and answer calls this option is typically used with the user <b>Offhook Station (User &gt; Telephony &gt; Call Settings)</b> setting which allows the extension user to make and answer calls using applications.</p> |
| <b>Paging Speaker</b>            | <p>Used for analog ports connected to a paging amplifier. This extension will present busy and cannot be called or be used to make calls. It can only be accessed using Dial Paging features.</p> <p>When using a UPAM connected to an analog extension port, the extension's <b>Equipment Classification</b> should be set to <b>IVR Port</b> rather than <b>Paging Speaker</b>.</p>                                                                                                                                                                                                                                                                                                                                   |
| <b>Standard Telephone</b>        | Use for normal analog phones.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Door Phone 1/Door Phone 2</b> | These two options are currently not used and so are grayed out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>IVR Port</b>                  | Used for analog ports connected to devices that require a disconnect clear signal (a break in the loop current) at the end of each call. When selected the <b>Disconnect Pulse Width</b> is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>FAX Machine</b>               | If fax Relay is being used, this setting should be selected on any analog extension connected to an analog fax machine. This setting can also be used with SIP trunks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>MOH Source</b>                | <p>If selected, the port can be used as a music on hold source in the <b>System &gt; Telephony &gt; Tones and Music</b> settings. An extension set as a music on hold source cannot make or receive calls. The audio input can be monitored through the extension music on hold controls.</p> <p>A suitable interface device is required to provide the audio input to the extension port. It must look to the system like an off-hook analog phone. For example, a transformer with a 600 Ohm winding (such as a Bogen WMT1A) or a dedicated MoH device with a 600 Ohm output designed for connection to a PBX extension port which is providing loop current can be used.</p>                                         |

### Flash Hook Pulse Width

The following options are only available for analog extension ports. They define the length of loop break that will be considered a time break recall (TBR) signal.

| Field                      | Description                                                                                                                            |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use System Defaults</b> | <p>Default = On</p> <p>Use the default values appropriate to the system's locale. Refer to <i>Avaya IP Office Locale Settings</i>.</p> |

## SIP Extension VOIP

Navigation: **Call Management > Extensions > Edit Extension > SIP VoIP**

The IP Office uses these settings for SIP extensions. For example, for J100 Series phones.

## T38 Fax

Navigation: **Call Management > Extensions > Edit Extension > SIP T38 Fax**

The settings are available only on IP500 V2 since it can terminate T38 fax. On the **VoIP** settings for the line type, **Fax Transport Support** must be set to **T38** or **T38 Fallback**.

These settings are mergeable.

| Field                                                                                                                                                                                   | Description                                                                                                                                                                                                                      |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use Default Values</b>                                                                                                                                                               | Default = On.<br>If selected, all the fields are set to their default values and greyed out.                                                                                                                                     |
| <b>T38 Fax Version</b>                                                                                                                                                                  | Default = 3.<br>During fax relay, the two gateways will negotiate to use the highest version which they both support. The options are: <b>0, 1, 2, 3</b> .                                                                       |
| <b>Transport</b>                                                                                                                                                                        | Default = UDPTL (fixed).<br>Only <b>UDPTL</b> is supported. <b>TCP</b> and <b>RTP</b> transport are not supported. For <b>UDPTL</b> , redundancy error correction is supported. Forward Error Correction (FEC) is not supported. |
| <b>Redundancy</b><br>Redundancy sends additional fax packets in order to increase the reliability. However increased redundancy increases the bandwidth required for the fax transport. |                                                                                                                                                                                                                                  |
| <b>Low Speed</b>                                                                                                                                                                        | Default = 0 (No redundancy). Range = 0 to 5.<br>Sets the number of redundant T38 fax packets that should be sent for low speed V.21 T.30 fax transmissions.                                                                      |
| <b>High Speed</b>                                                                                                                                                                       | Default = 0 (No redundancy). Range = 0 to 5.<br>Sets the number of redundant T38 fax packets that should be sent for V.17, V.27 and V.28 fax transmissions.                                                                      |
| <b>TCF Method</b>                                                                                                                                                                       | Default = Trans TCF. TCF = Training Check Frame.                                                                                                                                                                                 |
| <b>Max Bit Rate (bps)</b>                                                                                                                                                               | Default = 14400.<br>Lower rates can be selected if the current rate is not supported by the fax equipment or is found to not be reliable.                                                                                        |

## IP DECT Extension

Navigation: **Call Management > Extensions > Edit Extension > IP DECT**

IP DECT extensions are created manually after an IP DECT line has been added to the configuration or added automatically as DECT handsets subscribe to the DECT system.

These settings can be edited online with the exception of the **Reserve License** setting. The **Reserve License** setting must be edited offline and requires a reboot of the system. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

| Field                                       | Description                                                                                                                                                                                              |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DECT Line ID</b>                         | Use the drop-down list to select the IP DECT line from the system to the Avaya Wireless DECT system.                                                                                                     |
| <b>Message Waiting Lamp Indication Type</b> | <p>Default = On</p> <p>Allows selection of the message waiting indication to use with the IP DECT extension. The options are:</p> <ul style="list-style-type: none"> <li>• None</li> <li>• On</li> </ul> |

| Field                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reserve License</b> | <p>Default = None.</p> <p>By default, the IP Office issues phone licenses in the order that devices register. Using this setting, you can license an extension before the device registers.</p> <p>The options are:</p> <ul style="list-style-type: none"> <li>• <b>Reserve Avaya IP Endpoint License</b></li> <li>• <b>Reserve 3rd Party IP Endpoint License</b></li> <li>• <b>Both</b></li> <li>• <b>None</b></li> </ul> <p>Note:</p> <ul style="list-style-type: none"> <li>• Avaya IP phones supported by IP Office require an Avaya IP Endpoint license.</li> <li>• Other IP phones require a Third-Party IP Endpoint license.</li> <li>• When WebLM licensing is enabled, this field is automatically set to <b>Reserve Avaya IP Endpoint License</b>. The <b>Both</b> and <b>None</b> options are not available.</li> <li>• When the <b>Profile</b> of the corresponding user is set to <b>Centralized User</b>, this field is automatically set to <b>Centralized Endpoint License</b>.</li> </ul> |

The additional fields below depend on whether the IP DECT line has **Enable Provisioning** selected.

#### Enable Provisioning Not Selected

| Field               | Description                                                                                                                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Handset Type</b> | <p>Default = Unknown</p> <p>Correct selection of the handset type allows application of appropriate settings for the handset display and buttons. Selectable handset types are supported 3700 Series phones or <b>Unknown</b>.</p> |

#### Enable Provisioning Selected

| Field                            | Description                                                                                                                                                                                                                                                              |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IPEI</b>                      | <p>Default = 0 (Any IPEI)</p> <p>If set to a value other than 0, sets the IPEI number of the handset that is able to subscribe to the Avaya Wireless DECT system using this extension number. The IPEI for each DECT handset is unique.</p>                              |
| <b>Use Handset Configuration</b> | <p>Default = Off.</p> <p>If <b>Use Handset Configuration</b> is selected, the handset user is able to set the phone language and date/time format. If not selected, those settings will be driven by the system or user locale settings in the system configuration.</p> |

# Chapter 16: Groups

Navigation: **Call Management > Group**

## Additional configuration information

This section provides the Group field descriptions.

For additional configuration information, see [Group Operation](#) on page 887.

## Main content pane

The **Group** main content pane lists provisioned groups. The contents of the list depends on the filter option selected. Click the icons beside a record to edit or delete.

**Bulk delete:** You can delete multiple records. Select the check box to the right of each record you want to delete and click **Delete**. You receive a prompt to confirm the deletion.

Click **Add/Edit Group** to open the Add Groups window where you can provision a user. When you click **Add/Edit Group**, you are prompted to specify the server on which the group will be provisioned.

## Group Filters

| Filter            | Description                                                      |
|-------------------|------------------------------------------------------------------|
| <b>Show All</b>   | List all provisioned groups on all systems.                      |
| <b>Systems</b>    | List the groups provisioned on a specific system.                |
| <b>Ring Modes</b> | List groups provisioned with specific ring modes on all systems. |
| <b>Profiles</b>   |                                                                  |
| <b>Queuing</b>    | List groups with queuing enabled.                                |

## Additional configuration information

This type of configuration record can be saved as a template and new records created from a template. See [Working with Templates](#) on page 810.

## Configuration settings

The Group settings are used to define the name, extension number and basic operation of the group. It is also used to select the group members.

You can edit these settings online without needing to reboot the IP Office.

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| XMPP Group             | Extensible Messaging and Presence Protocol (XMPP) is a communications protocol for presence status and Instant Messaging (IM). Select XMPP to enable presence information and instant messaging within a defined group of XMPP enabled one-X clients. Two users can see each other's presence and exchange instant messages only if they are members of the same XMPP group. A user can be a member of zero or more groups.<br><br> <b>Important:</b><br><br>Before adding a user to an XMPP group, the user must be added to the configuration and the configuration saved. If the user is added to the group before the directory is synchronized, the user will not be visible in one-X Portal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                    |             |                     |                                                                                    |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Centralized Group      | Used for centralized extensions that are normally handled by the core feature server (Avaya Aura®) and are handled by the IP Office only when in survival mode due to loss of connection to the Avaya Aura®.<br><br>Calls arriving to a centralized hunt group number when the Avaya Aura® line is in-service are sent by the IP Office to Avaya Aura®.<br>Calls arriving to a centralized hunt group number when the Avaya Aura Session Manager line is out-of-service are processed by the IP Office and targeted to the hunt group members as configured on the IP Office.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                    |             |                     |                                                                                    |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                       | Sets how the system determines which hunt group member to ring first and the next hunt group member to ring if unanswered. This is used in conjunction with the <b>User List</b> which list the order of group membership. The options are:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |             |            |                                                                          |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |            |                                                                                                                |        |                                                                                                                                                                    |                 |                                                                                                                                                                                                                                                                                                                                                                                                             |

However, the last extension used is remembered. The next call received rings the next extension in the list. | Longest Waiting | <p>The extension that has been unused for the longest period rings first, then the extension that has been idle second longest rings, etc. For extensions with equal idle time, 'sequential' mode is used.</p> <p>Where hunt group calls are being presented to a twinned extension, the longest waiting status of the user can be reset by calls answered at either their master or twinned extension.</p> |

| Field                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Hold Music Source</b>                      | <p>Default = No Change.</p> <p>The system can support multiple music on hold sources; the <b>System Source</b> (either an internal file or the external source port or tones) plus a number of additional internal sources (3 on IP500 V2 systems, 31 on Linux systems), see <b>System &gt; Telephony &gt; Tones &amp; Music</b>.</p> <p>Before reaching a hunt group, the source used is set by the system wide setting or by the <b>Incoming Call Route</b> that routed the call. If the system has several hold music sources available, this field allows selection of the source to associate with calls presented to this hunt group or to leave it unchanged. The new source selection will then apply even if the call is forwarded or transferred out of the hunt group unless changed again by another hunt group.</p> <p>If the call is routed to another system in a multi-site network, the matching source on that system is used if available.</p> <p>Hunt group calls overflowing ignore the settings of the <b>Overflow Group List</b> groups.</p> <p>Calls going to night service or out of service fallback group use the hold music source setting of the original hunt group and then, if different, the setting of the fallback group. The setting of further fallback groups from the first are ignored.</p> |
| <b>Ring Tone Override</b>                     | <p>Default = Blank</p> <p>If ring tones have been configured in the <b>System   Telephony   Ring Tones</b> tab, they are available in this list. Setting a ring tone override applies a unique ring tone for the hunt group. Ring tone override features are only supported on 1400, 9400, 9500, and J100 Series (except J129) phones.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Agent's Status on No-Answer Applies To</b> | <p>Default = None (No status change).</p> <p>For hunt group members with a login code set and <b>Force Log</b> enabled, the system can change their status if they do not answer a hunt group call presented to them within the group's <b>No Answer Time</b>.</p> <ul style="list-style-type: none"> <li>• This setting defines what type of hunt group calls can trigger use of the agent's <b>Status on No Answer</b> setting. The options are <b>None</b>, <b>Any Call</b> and <b>External Inbound Calls Only</b>.</li> <li>• The new status is set by the agent's <b>Status on No Answer</b> setting (<b>User &gt; Telephony &gt; Supervisor Settings</b>).</li> <li>• The <b>Status on No Answer</b> action does not apply if the call is presented and then answered elsewhere or the caller disconnects.</li> <li>• This option is not used for calls ringing the agent because the group is in another group's <b>Overflow Group List</b>.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                      |

|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>User List</b> | <p>This is an ordered list of the users who are members of the hunt group. For <b>Sequential</b> and <b>Rotary</b> groups it also sets the order in which group members are used for call presentation.</p> <ul style="list-style-type: none"> <li>• Repeated numbers can be used, for example 201, 202, 201, 203, etc. Each extension will ring for the number of seconds defined by the <b>No Answer Time</b> before moving to the next extension in the list, dependent on the Hunt Type chosen.</li> <li>• The check box next to each member indicates the status of their membership. Group calls are not presented to members who have their membership currently disabled. However, those users are still able to perform group functions such as group call pickup.</li> <li>• The order of the users can be changed by dragging the existing records to the required position.</li> <li>• To add records select <b>Edit</b>. A new menu is displayed that shows available users on the left and current group members of the right. The lists can be sorted and filtered.</li> <li>• Users on remote systems in a multi-site network can also be included. Groups containing remote members are automatically advertised within the network.</li> <li>• Before adding a user to an XMPP group, the user must be added to the configuration and the configuration saved. If the user is added to the group before the directory is synchronized, the user will not be visible in one-X Portal.</li> </ul> |

## Queuing

Navigation: **Call Management > Group > Add/Edit Group > Queuing**

Any calls waiting to be answered at a hunt group are regarded as being queued. The **Normalise Queue Length** control allows selection of whether features that are triggered by the queue length should include or exclude ringing calls. Once one call is queued, any further calls are also queued. When an available hunt group member becomes idle, the first call in the queue is presented. Calls are added to the queue until the hunt group's Queue Limit, if set, is reached.

- When the queue limit is reached, any further calls are redirected to the hunt group's voicemail if available.
- If voicemail is not available excess calls receive busy tone. An exception to this are analog trunk and T1 CAS trunk calls which will remain queued regardless of the queue limit if no alternate destination is available.
- If an existing queued call is displaced by a higher priority call, the displaced call will remain queued even if it now exceeds the queue limit.

Hunt group announcements are separate from queuing. Announcements can be used even if queuing is turned off and are applied to ringing and queued calls. See Hunt Group | Announcements.

There are several methods of displaying a hunt group queue.

- **Group Button:** On phones, with programmable buttons, the **Group** function can be assigned to monitor a specified group. The button indicates when there are calls ringing within the group and also when there are calls queued. The button can be used to answer the longest waiting call.
- **SoftConsole:** The SoftConsole applications can display queue monitors for up to 7 selected hunt groups. This requires the hunt group to have queuing enabled. These queues can be used by the SoftConsole user to answer calls.

When a hunt group member becomes available, the first call in the queue is presented to that member. If several members become available, the first call in the queue is simultaneously presented to all the free members.

**Overflow Calls** Calls that overflow are counted in the queue of the original hunt group from which they overflow and not that of the hunt group to which they overflow. This affects the **Queue Limit** and **Calls in Queue Threshold**.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Queuing On</b>   | Default = On<br>If enabled, calls to the hunt group are queued.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Queue Length</b> | Default = No Limit. Range = No Limit, 1 to 99 calls.<br>This setting can be used to limit the number of calls that can be queued. Calls exceeding this limit are passed to voicemail if available or otherwise receive busy tone. This value is affected by Normalize Queue Length setting. <ul style="list-style-type: none"> <li>• If voicemail is not available excess calls receive busy tone. An exception to this is analog trunk and T1 CAS trunk calls which will remain queued regardless of the queue limit if no alternate destination is available. This is due to the limited call status signalling supported by those trunks which would otherwise create scenarios where the caller has received ringing from the local line provider and then suddenly gets busy from the system, creating the impression that the call was answered and then hung up.</li> <li>• If priority is being used with incoming call routes, high priority calls are placed ahead of lower priority calls. If this would exceed the queue limit the limit is temporarily increased by 1.</li> <li>• If an existing queued call is displaced by a higher priority call, the displaced call will remain queued even if it now exceeds the queue limit.</li> </ul> |

| Field                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Normalize Queue Length</b>     | <p>Default = On.</p> <p>Calls both waiting to ring and ringing are regarded as being queued. This therefore affects the use of the <b>Queue Limit</b> and <b>Calls in Queue Alarm</b> thresholds. If <b>Normalize Queue Length</b> is enabled, the number of hunt group members logged in and not on DND is added to those thresholds.</p> <p>For example, a customer has two products that it is selling through a call center with 10 available agents; one product with a \$10 margin and one with a \$100 margin. Separate hunt groups with the same 10 members are created for each product.</p> <ul style="list-style-type: none"> <li>• The \$100 product has a Queue Limit of 5 and Normalize Queue Length is on. The maximum number of \$100 calls that can be waiting to be answered will be 15 (10 ringing/connected + 5 waiting to ring).</li> <li>• The \$10 product has a Queue Limit of 5 and Normalize Queue Length is off. The maximum number of \$10 calls that can be waiting to be answered is 5 (5 ringing/connected).</li> </ul> |
| <b>Queue Type</b>                 | <p>Default = Assign Call On Agent Answer.</p> <p>When queuing is being used, the call that the agent receives when they answer can be assigned in one of two ways:</p> <ul style="list-style-type: none"> <li>• <b>Assign Call On Agent Answer</b> In this mode the call answered by the hunt group member will always be the longest waiting call of the highest priority. The same call will be shown on all ringing phones in the group. At the moment of answering that may not necessarily be the same call as was shown by the call details at the start of ringing.</li> <li>• <b>Assign Call on Agent Alert</b> In this mode, once a call has been presented to a hunt group member, that is the call they will answer if they go off hook. This mode should be used when calls are being presented to applications which use the call details such as a fax server, CTI or TAPI.</li> </ul>                                                                                                                                                   |
| <b>Calls In Queue Alarm</b>       | The system can be set to send an alert to a analog specified extension when the number of calls queued for the hunt group reaches the specified threshold.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Calls In Queue Threshold</b>   | <p>Default = Off. Range = 1 to 99.</p> <p>Alerting is triggered when the number of queued calls reaches this threshold. Alerting will stop only when the number of queued calls drops back below this threshold. This value is affected by <b>Normalize Queue Length</b> setting above.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Analog Extension to Notify</b> | <p>Default = &lt;None&gt;.</p> <p>This should be set to the extension number of a user associated with an analog extension. The intention is that this analog extension port should be connected to a loud ringer or other alerting device and so is not used for making or receiving calls. The list will only shown analog extensions that are not members of any hunt group or the queuing alarm target for any other hunt group queue. The alert does not follow user settings such as forwarding, follow me, DND, call coverage, etc or receive ICLID information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Group Queue Controls

| Group Queue Settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Overflow

Navigation: **Call Management > Group > Add/Edit Group > Overflow**

Overflow can be used to expand the list of group members who can be used to answer a call. This is done by defining an overflow group or groups. The call is still targeted to the original group and subject to that group's settings, but is now presented to available members in the overflow groups in addition to its own available members.

Overflow calls still use the settings of the original target group. The only settings of the overflow group that is used is its **Ring Mode**. For example:

- Calls that overflow use the announcement settings of the group from which they are overflowing.
- Calls that overflow use the **Voicemail Answer Time** of the original group from which they are overflowing.
- Calls that are overflowing are included in the overflowing group's **Queue Length** and **Calls In Queue Threshold**. They are not included in those values for the hunt group to which they overflow.
- The queuing and overflow settings of the overflow groups are not used, ie. calls cannot cascade through a series of multiple overflows.

A call will overflow in the following scenarios:

- If **Queuing** is off and all members of the hunt group are busy, a call presented to the group will overflow immediately, irrespective of the **Overflow Time**.

- If **Queuing** is on and all members of the hunt group are busy, a call presented to the group will queue for up to the **Overflow Time** before overflowing.
- If **Queuing** is on but there are no members logged in or enabled, calls can be set to overflow immediately by setting the **Overflow Immediate** setting to **No Active Members**. Otherwise calls will queue until the **Overflow Time** expires.
- If no **Overflow Time** is set, a call will overflow when it has rung each available hunt group member without being answered.
- Once one call is in overflow mode, any additional calls will also overflow if the **Overflow Mode** is set to **Group** (the default).

An overflow call is presented to available group members as follows:

- Once a call overflows, it is presented to the first available member of the first overflow group listed. The **Ring Mode** of the overflow group is used to determine its first available member. However the **No Answer Time** of the original targeted group is used to determine how long the call is presented.
- When the **No Answer Time** expires, the call is presented to the next available member in the overflow group. If all available members in the overflow group have been tried, the first member in the next listed overflow group is tried.
- When the call has been presented to all available members in the overflow groups, it is presented back to the first available member in the original target group.
- While the call is being presented to members in an overflow group, the announcement and voicemail settings of the original targeted group are still applied.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Overflow Time</b> | Default = Blank. Range = Off or 1 to 3600 seconds.<br><br>For a group using queuing, the <b>Overflow Time</b> sets how long a call queues before being presented to available agents in the group's <b>Overflow Group List</b> . Note that if the call is currently ringing an agent when the timer expires, it will complete ringing for the group's <b>No Answer Time</b> before overflowing.                                                                                                         |
| <b>Overflow Mode</b> | Default = Group.<br><br>This option allows selection of whether the overflow of queued calls is determined on an individual call by call basis or is applied to all calls once any one call overflows. The options are:<br><ul style="list-style-type: none"> <li>• <b>Group</b>: In this mode, once one call overflows all additional queued calls also overflow.</li> <li>• <b>Call</b>: In this mode, each individual call will follow the group's overflow settings before it overflows.</li> </ul> |

## Fallback

Navigation: **Call Management > Group > Add/Edit Group > Fallback**

Fallback settings can be used to make a hunt group unavailable and to set where the hunt group's calls should be redirected at such times. Hunt groups can be manually placed In Service, Out of Service or in Night Service. Additionally using a time profile, a group can be automatically placed in Night Service when outside the Time Profile settings.

Fallback redirects a hunt group's calls when the hunt group is not available, for example outside normal working hours. It can be triggered either manually or using an associated time profile.

### Group Service States:

A hunt group can be in one of three states; **In Service**, **Out of Service** or **Night Service**. When **In Service**, calls are presented as normal. In any other state, calls are redirected as below.

### Call Redirection:

The following options are possible when a hunt group is either **Out of Service** or in **Night Service**.

- **Destination:** When in **Out of Service**, if an **Out of Service Destination** has been set, calls are redirected to that destination. When in **Night Service**, if a **Night Service Destination** has been set, calls are redirected to that destination.
- **Voicemail:** If no fallback destination has been set but voicemail is enabled for the group, calls are redirected to voicemail.
- **Busy Tone:** If no fallback destination has been set and voicemail is not available, busy tone is returned to calls.

### Manually Controlling the Service State:

Manager and or short codes can be used to change the service state of a hunt group. The short code actions can also be assigned to programmable buttons on phones.

- The  icon is used for a hunt group manually set to **Night Service** mode.
- The  icon is used for a hunt group manually set to **Out of Service** mode.

Setting and clearing hunt group night service can be done using either manual controls or using a system time profile. The use of both methods to control the night service status of a particular hunt group is not supported. You can manually override a time profile.

### Time Profile:

A **Day Service Time Profile** can be associated with the hunt group. A time profile if required, is set through **System Settings > Time Profiles > Add/Edit Time Profile**.

When outside the time profile, the hunt group is automatically placed into night service. When inside the time profile, the hunt group uses manually selected mode.

- When outside the time profile and therefore in night service, manual night service controls cannot be used to override the night service. However the hunt group can be put into out of service.
- When a hunt group is in Night Service due to a time profile, this is not indicated within Manager.
- Time profile operation does not affect hunt groups set to Out of Service.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Day Service Time Profile</b>      | <p>Default = &lt;None&gt; (No automatic night service)</p> <p>This field allows selection of a previously created Time Profile. That profile then specifies the times at which it should use the manually selected Service Mode settings. Outside the period defined in the time profile, the hunt group behaves as if set to Night Service mode.</p> <p>Note that when a hunt group is in Night Service due to its associated time profile, this is not reflected by the Service Mode on this tab. Note also that the manual controls for changing a hunt group's service mode cannot be used to take a hunt group out of time profile night service.</p>                                                                                                                                                                                                                            |
| <b>Night Service Destination</b>     | <p>Default = &lt;None&gt; (Voicemail or Busy Tone)</p> <p>This field sets the alternate destination for calls when this hunt group is in Night Service mode. The destination can be a group, a user, a short code, or an Auto Attendant. Select a group or user from the drop down list. Manually enter a short code or an Auto Attendant name.</p> <p>If left blank, calls are redirected to voicemail if available or otherwise receive busy tone.</p>                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Out of Service Fallback Group</b> | <p>Default = &lt;None&gt; (Voicemail or Busy Tone)</p> <p>This field sets the alternate destination for calls when this hunt group is in Out of Service mode. The destination can be a group, a user, a short code, or an Auto Attendant. Select a group or user from the drop down list. Manually enter a short code or an Auto Attendant name. For Auto Attendant names, use the format <b>AA:Name</b>.</p> <p>If left blank, calls are redirected to voicemail if available or otherwise receive busy tone.</p>                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Mode</b>                          | <p>Default = In Service</p> <p>This field is used to select the current service mode for the hunt group manually. The options are:</p> <ul style="list-style-type: none"> <li>• <b>In Service:</b> When selected, the hunt group is enabled. This is the default mode.</li> <li>• <b>Night Service:</b> When selected, calls are redirected using the <b>Night Service Fallback Group</b> setting. This setting can also be manually controlled using the short code, and button programming features Set Hunt Group Night Service and Clear Hunt Group Night Service.</li> <li>• <b>Out of Service:</b> When selected, calls are redirected using the <b>Out of Service Fallback Group</b> setting. This setting can also be manually controlled using the short code, and button programming features Set Hunt Group Out of Service and Clear Hunt Group Out of Service.</li> </ul> |
| <b>Group No Answer Time</b>          | <p>Default = 45 seconds, Range = 1 to 3600 seconds.</p> <p>This setting sets the time duration on preting a call to a hunt group and its overflow groups if set before going to the group's <b>Group No Answer Destination</b>.</p> <p>Exceeding the time duration redirects the call regardless of any announcements, overflow, or queue. If <b>Group No Answer Time</b> is set to <b>Off</b>, the no answer destination is used, and once each available member of the hunt group is alerted for the group's <b>No Answer Time</b>.</p>                                                                                                                                                                                                                                                                                                                                             |

*Table continues...*

| Field                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group No Answer Destination</b> | <p>When an unanswered call to a hunt group reaches the <b>Group No Answer Time</b>, you can configure the following options:</p> <ul style="list-style-type: none"> <li>• <b>&lt;NONE&gt;</b> - The destination is not used. Instead, calls continue ringing against the hunt group.</li> <li>• <b>Voicemail</b> - The call is redirected to a voicemail to leave a message and uses the call original destination mailbox. Set to <b>Voicemail</b> for default configurations.</li> <li>• The drop-down list includes all other group and user extensions and redirects the call to that extension.</li> <li>• You can enter a number manually to match against system short codes.</li> </ul> |

## Hunt Group Fallback Controls

The following short code features and button programming actions can be used.

| Feature/Action                  | Short Code | Default | Button      |
|---------------------------------|------------|---------|-------------|
| Set Hunt Group Night Service    | Yes        | *20*N#  | Yes-Toggles |
| Clear Hunt Group Night Service  | Yes        | *21*N#  | Yes         |
| Set Hunt Group Out of Service   | No         | No      | Yes-Toggles |
| Clear Hunt Group Out of Service | No         | No      | Yes         |

Note that for a hunt group using a time profile, these controls only are only applied when the hunt group is within the specified time profile period. When outside its time profile, the hunt group is in night service mode and cannot be overridden.

## Voicemail

Navigation: **Call Management > Group > Add/Edit Group > Voicemail**

The system supports voicemail for hunt groups in addition to individual user voicemail mailboxes.

If voicemail is available and enabled for a hunt group, it is used in the following scenarios.

| Scenario                    | Description                                                                                                                           |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group No Answer Time</b> | For 11.1 FP1 and higher, the use of voicemail to answer calls during normal operation is controlled by the group's Fallback settings. |

*Table continues...*

| Scenario                        | Description                                                                                                                                                                                                              |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Voicemail Answer Time</b>    | This option is only used for pre-11.1 FP1 systems. A call goes to voicemail when this timeout is reached, regardless of any announcement, overflow, queuing or other settings. The default timeout is 45 seconds.        |
| <b>Unanswered Calls</b>         | A call goes to voicemail when it has been presented to all the available hunt group members without being answered. If overflow is being used, this includes be presented to all the available overflow group members.   |
| <b>Night Service</b>            | A call goes to voicemail if the hunt group is in night service with no <b>Night Service Fallback Group</b> set.                                                                                                          |
| <b>Out of Service</b>           | A call goes to voicemail if the hunt group is out of service with no <b>Out of Service Fallback Group</b> set.                                                                                                           |
| <b>Queue Limit Reached</b>      | If queuing is being used, it overrides use of voicemail prior to expiry of the <b>Voicemail Answer Time</b> , unless the number of queued callers exceeds the set <b>Queue Limit</b> . By default there is no set limit. |
| <b>Automatic Call Recording</b> | Incoming calls to a hunt group can be automatically recorded using the settings on the <b>Hunt Group &gt; Voice Recording tab</b> .                                                                                      |

When a caller is directed to voicemail to leave a message, the system indicates the target user or hunt group mailbox.

The mailbox of the originally targeted user or hunt group is used. This applies even if the call has been forwarded to another destination. It also includes scenarios where a hunt group call overflows or is in fallback to another group.

Voicemail Pro can be used to customize which mailbox is used separately from the mailbox indicated by the system.

By default no user is configured to receive message waiting indication when a hunt group voicemail mailbox contains new messages. Message waiting indication is configured by adding a **H groupname** record to a user's **SourceNumbers** tab (**User > Source Numbers**).

By default, no mechanism is provided for access to specific hunt group mailboxes. Access needs to be configured using either a short code, programmable button or source number.

- **Intuity Emulation Mailbox Mode:**For systems using Intuity emulation mode mailboxes, the hunt group extension number and voicemail code can be used during normal mailbox access.
- **Avaya Branch Gateway Mailbox Mode or IP Office Mailbox Mode:** For this mode of mailbox access, short codes or a Voicemail Collect button are required to access the mailbox directly.

The voicemail system (Voicemail Pro only) can be instructed to automatically forward messages to the individual mailboxes of the hunt group members. The messages are not stored in the hunt group mailbox.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Voicemail Code</b> | <p>Default = Blank. Range = 0 (no code) to 15 digits.</p> <p>A code used by the voicemail server to validate access to this mailbox. If remote access is attempted to a mailbox that has no voicemail code set, the prompt "Remote access is not configured on this mailbox" is played.</p> <p>The mailbox access code can be set through IP Office Manager or through the mailbox telephone user interface (TUI). The minimum password length is:</p> <ul style="list-style-type: none"> <li>• Voicemail Pro (Manager) - 0</li> <li>• Voicemail Pro (Intuity TUI) - 2</li> <li>• Embedded Voicemail (Manager) - 0</li> <li>• Embedded Voicemail (Intuity TUI) - 0</li> </ul> <p>Codes set through the Voicemail Pro telephone user interface are restricted to valid sequences. For example, attempting to enter a code that matches the mailbox extension, repeat the same number (1111) or a sequence of numbers (1234) are not allowed. If these types of code are required they can be entered through Manager.</p> <p>Manager does not enforce any password requirements for the code if one is set through Manager.</p> <ul style="list-style-type: none"> <li>• <b>Embedded Voicemail</b> For Embedded Voicemail running in IP Office mailbox mode, the voicemail code is used if set.</li> <li>• <b>IP Office mode</b> The voicemail code is required when accessing the mailbox from a location that is not set as a trusted number in the user's Source Numbers list.</li> <li>• <b>Intuity Emulation mode</b> By default the voicemail code is required for all mailbox access. The first time the mailbox is accessed the user will be prompted to change the password. Also if the voicemail code setting is left blank, the caller will be prompted to set a code when they next access the mailbox. The requirement to enter the voicemail code can be removed by adding a customized user or default collect call flow, refer to the Voicemail Pro manuals for full details.</li> <li>• <b>Trusted Source Access</b> The voicemail code is required when accessing the mailbox from a location that is not set as a trusted number in the user's Source Numbers list.</li> <li>• <b>Call Flow Password Request</b> Voicemail Pro call flows containing an action where the action's PIN code set to \$ will prompt the user for their voicemail code.</li> </ul> |
| <b>Voicemail Help</b> | <p>Default = Off</p> <p>This option controls whether users retrieving messages are automatically given an additional prompt "For help at any time press 8." If switched off, users can still press 8 for help. For voicemail systems running in Intuity emulation mode, this option has no effect. On those systems the default access greeting always includes the prompt "For help at any time, press *4" (*H in the US locale).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Field                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Broadcast</b>        | <p>Default = Off. (Voicemail Pro only).</p> <p>When enabled, if a voicemail message is left for the hunt group, copies of the message are forwarded to the mailboxes of the individual group members. The original message in the hunt group mailbox is deleted unless it occurred as the result of call recording. This feature is not applied to recordings created by <b>Voice Question</b> actions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>UMS Web Services</b> | <p>Default = Off.</p> <p>This option is used with Voicemail Pro. If enabled, the hunt group mailbox can be accessed using either an IMAP email client or a web browser. Note that the mailbox must have a voicemail code set in order to use either of the UMS interfaces. <b>UMS Web Service</b> licenses are required for the number of groups configured.</p> <p>In the License section, double-clicking on the <b>UMS Web Services</b> license display a menu that allows you to add and remove users and groups from the list of those enabled for UMS Web Services without having to open the settings of each individual user or group.</p>                                                                                                                                                                                                                                                                                                |
| <b>Voicemail Email:</b> | <p>Default = Blank (No voicemail email features)</p> <p>This field is used to set the user or group email address used by the voicemail server for voicemail email operation. When an address is entered, the additional Voicemail Email control below are selectable to configure the type of voicemail email service that should be provided.</p> <p>Use of voicemail email requires the Voicemail Pro server to have been configured to use either a local MAPI email client or an SMTP email server account. For Embedded Voicemail, voicemail email is supported and uses the system's SMTP settings.</p> <p>The use of voicemail email for the sending (automatic or manual) of email messages with wav files attached should be considered with care. A one-minute message creates a 1MB .wav file. Many email systems impose limits on emails and email attachment sizes. For example the default limit on an Exchange server is 5MB.</p> |

| Field                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Voicemail Email</b> | <p>Default = Off</p> <p>If an email address is entered for the user or group, the following options become selectable. These control the mode of automatic voicemail email operation provided by the voicemail server whenever the voicemail mailbox receives a new voicemail message.</p> <p>Users can change their voicemail email mode using visual voice. If the voicemail server is set to IP Office mode, user can also change their voicemail email mode through the telephone prompts. The ability to change the voicemail email mode can also be provided by Voicemail Pro in a call flow using a Play Configuration Menu action or a Generic action.</p> <p>If the voicemail server is set to IP Office mode, users can manually forward a message to email.</p> <p>The options are:</p> <ul style="list-style-type: none"> <li>• <b>Off</b> If off, none of the options below are used for automatic voicemail email. Users can also select this mode by dialing *03 from their extension.</li> <li>• <b>Copy</b> If this mode is selected, each time a new voicemail message is received in the voicemail mailbox, a copy of the message is attached to an email and sent to the email address. There is no mailbox synchronization between the email and voicemail mailboxes. For example reading and deletion of the email message does not affect the message in the voicemail mailbox or the message waiting indication provided for that new message.</li> <li>• <b>Forward</b> If this mode is selected, each time a new voicemail message is received in the voicemail mailbox, that message is attached to an email and sent to the email address. No copy of the voicemail message is retained in the voicemail mailbox and there is no message waiting indication. As with Copy, there is no mailbox synchronization between the email and voicemail mailboxes. Users can also select this mode by dialing *01 from their extension.</li> </ul> <p>Note that until email forwarding is completed, the message is present in the voicemail server mailbox and so may trigger features such as message waiting indication.</p> <ul style="list-style-type: none"> <li>• <b>UMS Exchange 2007</b> With Voicemail Pro, the system supports voicemail email to an Exchange 2007 server email account. For users and groups also enabled for UMS Web Services this significantly changes their mailbox operation. The Exchange Server inbox is used as their voicemail message store and features such as message waiting indication are set by new messages in that location rather than the voicemail mailbox on the voicemail server. Telephone access to voicemail messages, including Visual Voice access, is redirected to the Exchange 2007 mailbox.</li> <li>• <b>Alert</b> If this mode is selected, each time a new voicemail message is received in the voicemail mailbox, a simple email message is sent to the email address. This is an email message announcing details of the voicemail message but with no copy of the voicemail message attached. Users can also select this mode by dialing *02 from their extension.</li> </ul> |

Navigation: **Call Management > Group > Add/Edit Group > Voicemail Recording**

This tab is used to configure automatic recording of calls handled by hunt group members.

- Call recording requires Voicemail Pro to be installed and running. Call recording also requires available conference resources similar to a 3-way conference.
- Call recording starts when the call is answered.
- Call recording is paused when the call is parked or held. It restarts when the call is unparked or taken off hold. This does not apply to SIP terminals.
- Calls to and from IP devices, including those using Direct media, can be recorded.
- Recording continues for the duration of the call or up to the maximum recording time configured on the voicemail server.
- Recording is stopped when the call ends or if:
  - User call recording stops if the call is transferred to another user.
  - Account code call recording stops if the call is transferred to another user.
  - Hunt group call recording stops if the call is transferred to another user who is not a member of the hunt group.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Record Inbound</b>      | Default = None<br>Select whether automatic recording of incoming calls is enabled. The options are: <ul style="list-style-type: none"> <li>• <b>None</b>: Do not automatically record calls.</li> <li>• <b>On</b>: Record the call if possible. Otherwise, allow the call to continue without recording.</li> <li>• <b>Mandatory</b>: Record the call if possible. Otherwise, block the call and return busy tone.</li> <li>• <b>Percentages of calls</b>: Record a selected percentages of the calls.</li> </ul> |
| <b>Record Time Profile</b> | Default = <None> (Any time)<br>Used to select a time profile during which automatic call recording of incoming calls is applied. If no profile is selected, automatic recording is always active.                                                                                                                                                                                                                                                                                                                 |

| Field                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Recording (Auto)</b>  | <p>Default = Mailbox</p> <p>Sets the destination for automatically triggered recordings. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Mailbox</b> This option sets the destination for the recording to be a selected user or hunt group mailbox. The adjacent drop down list is used to select the mailbox.</li> <li>• <b>Voice Recording Library</b>: This option set the destination for the recording to be a VRL folder on the voicemail server. The VRL application polls that folder and collects waiting recordings which it then places in its archive. Recording is still done by Voicemail Pro.</li> <li>• <b>Voice Recording Library Authenticated</b>: This option is similar to the above but instructs the voicemail server to create an authenticated recording. If the file contents are changed, the file is invalidated though it can still be played.</li> </ul> <p>- For systems recording to .opus format (the default), both settings create authenticated recordings.</p> |
| <b>Auto Record Calls</b> | <p>Default = External.</p> <p>This setting allows selection of which calls are recorded. The options are <b>External</b> or <b>External &amp; Internal</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Announcements

Navigation: **Call Management > Group > Add/Edit Group > Announcements**

Announcements are played to callers waiting to be answered. This includes callers being presented to hunt group members, ie. ringing, and callers queued for presentation.

- The system supports announcements using Voicemail Pro or Embedded Voicemail.
- If no voicemail channel is available for an announcement, the announcement is not played.
- In conjunction with Voicemail Pro, the system allows a number of voicemail channels to be reserved for announcements. See **System Settings > System > Voicemail**.
- With Voicemail Pro, the announcement can be replaced by the action specified in a Queued (1st announcement) or Still Queued (2nd announcement) start point call flow. Refer to the *Voicemail Pro Installation and Maintenance* documentation for details.
- Calls can be answered during the announcement. If it is a mandatory requirement that announcements should be heard before a call is answered, then a Voicemail Pro call flow should be used before the call is presented.
- A call becomes connected when the first announcement is played to it. That connected state is signaled to the call provider who may start billing at that point. The call will also be recorded as answered within the SMDR output once the first announcement is played.
- If a call is rerouted to a hunt group's Night Service Group or Out of Service Fallback Group, the announcements of the new group are applied.

- If a call overflows, the announcements of the original group are still applied, not those of the overflow group.
- For announcements to be used effectively, the hunt group's **Voicemail Answer Time** must be extended or **Voicemail On** must be unselected.

## Recording the Group Announcement

Voicemail Pro provides a default announcement "I'm afraid all the operators are busy but please hold and you will be transferred when somebody becomes available". This default is used for announcement 1 and announcement 2 if no specific hunt group announcement has been recorded. Embedded Voicemail does not provide any default announcement. Voicemail Lite also provides the default announcements.

The maximum length for announcements is 10 minutes. New announcements can be recorded using the following methods.

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Voicemail Pro</b>      | <p>The method of recording announcements depends on the mailbox mode being used by the voicemail server.</p> <ul style="list-style-type: none"> <li>• <b>IP Office Mailbox Mode:</b></li> </ul> <p>Access the hunt group mailbox and press 3. Then press either 3 to record the 1st announcement for the hunt group or 4 to record the 2nd announcement for the hunt group.</p> <ul style="list-style-type: none"> <li>• <b>Intuity Emulation Mailbox Mode:</b></li> </ul> <p>There is no mechanism within the Intuity telephony user interface (TUI) to record hunt group announcements. To provide custom announcements, hunt group queued and still queued start points must be configured with Voicemail Pro with the required prompts played by a generic action.</p> |
| <b>Embedded Voicemail</b> | <p>Embedded Voicemail does not include any default announcement or method for recording announcements. The <b>Record Message</b> short code feature is provided to allow the recording of announcements.</p> <p>The telephone number field of short codes using this feature requires the extension number followed by either ".1" for announcement 1 or ".2" for announcement 2. For example, for extension number 300, the short codes <b>*91N#   Record Message   N".1"</b> and <b>*92N#   Record Message   N".2"</b> could be used to allow recording of the announcements by dialing <b>*91300#</b> and <b>*92300#</b>.</p>                                                                                                                                           |

## Settings

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                   | Description                                                                  |
|-------------------------|------------------------------------------------------------------------------|
| <b>Announcements On</b> | <p>Default = Off.</p> <p>This setting enables or disables announcements.</p> |

*Table continues...*

| Field                                | Description                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Wait before 1st announcement:</b> | Default = 10 seconds. Range = 0 to 255 seconds.<br><br>This setting sets the time delay from the calls presentation, after which the first announcement should be played to the caller. If <b>Synchronize Calls</b> is selected, the actual wait may differ, see below.                                                                             |
| <b>Flag call as answered</b>         | Default = Off.<br><br>This setting is used by the CCC and CBC applications. By default they do not regarded a call as answered until it has been answered by a person or by a Voicemail Pro action with <b>Flag call as answered</b> selected. This setting allows calls to be marked as answered once the caller has heard the first announcement. |
| <b>Post announcement tone</b>        | Default = Music on hold.<br><br>Following the first announcement, you can select whether the caller should hear Music on Hold, <b>Ring</b> or <b>Silence</b> until answered or played another announcement.                                                                                                                                         |
| <b>2nd Announcement</b>              | Default = On.<br><br>If selected, a second announcement can be played to the caller if they have still not been answered.                                                                                                                                                                                                                           |
| <b>Wait before 2nd announcement</b>  | Default = 20 seconds. Range = 0 to 255 seconds.<br><br>This setting sets the wait between the 1st and the 2nd announcement. If <b>Synchronize Calls</b> is selected, the actual wait may differ, see below.                                                                                                                                         |
| <b>Repeat last announcement</b>      | Default = On.<br><br>If selected, the last announcement played to the caller is repeated until they are answered or hang-up.                                                                                                                                                                                                                        |
| <b>Wait before repeat</b>            | Default = 20 seconds. Range = 0 to 255 seconds.<br><br>If <b>Repeat last announcement</b> is selected, this setting sets is applied between each repeat of the last announcement. If <b>Synchronize Calls</b> is selected, this value is grayed out and set to match the <b>Wait before 2nd announcement</b> setting.                               |

## SIP

Navigation: **Call Management > Group > Add/Edit Group > SIP**

Each hunt group can be configured with its own SIP URI information. For calls received on a SIP line where any of the line's SIP URI fields are set to **Use Internal Data**, if the call is presented to the hunt group that data is taken from these settings.

This form is hidden if there are no system multi-site network lines in the configuration or no SIP lines with a URI set to **Use Internal Data**.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# Chapter 17: Conferences

## Call Management > Conferences

Systems support system meet-me conferences in addition to the normal ad-hoc and personal conferences.

For full details, see [System Conferences](#) on page 704.

| Field                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Conference ID</b>  | <p>Range = Up to 15 digits.</p> <p>This ID is shown in the destination list for auto-attendant actions and incoming call routes. The ID can also be used with short code and programmable button features in order to access the conference.</p> <ul style="list-style-type: none"><li>• Do not enter a number that matches a user's extension number. Doing so will override that user's personal meet-me conference facility.</li><li>• It is advisable not to use conference ID's that are near the range that may be in use for ad-hoc conferences as above (100 plus). Once a conference ID is in use by an ad-hoc conference, it is no longer possible to join the conference using the various conference meet me features.</li></ul>                                                                                                                                                                                                           |
| <b>Name</b>           | <p>This is a short name to help indicate the system conferences intended use. For example, "Sales Team".</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Moderator List</b> | <p>Optional. Default = No moderators.</p> <p>List the internal users who are moderators for this system conference, up to a maximum of 8 moderators. When set:</p> <ul style="list-style-type: none"><li>• The conference <b>Hold Music</b> is played to other participants when there is no moderator in the conference.</li><li>• These user's do not need to enter a PIN in order to access the conference.</li><li>• Listed users using the User Portal application can view the conference PIN details.</li></ul> <p>In addition:</p> <ul style="list-style-type: none"><li>• Other participants, including external participants, can become moderators by entering the <b>Moderator Pin</b> when they join the conference.</li><li>• Conferences with no defined moderators (blank <b>Moderator List</b> and no <b>Moderator Pin</b>) start immediately any caller joins and can have recording started/stopped by any internal user.</li></ul> |

|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Recording Destination</b>        | <p>Default = <b>Conference Mailbox</b></p> <p>Sets the destination for system conference recordings. Note that the selected option may also affect the maximum recording length:</p> <ul style="list-style-type: none"> <li>• <b>Conference Mailbox</b> - Place calls into a standard group mailbox, using the conference ID as the mailbox number. Maximum recording length 60 minutes. Message waiting indication and visual voice access can be configured by adding <b>C&lt;conference ID&gt;</b> to a user's source numbers.</li> <li>• <b>Conference VRL</b> - Transfer the conference recordings to the systems VRL application (on subscription systems, set by the <b>System &gt; System &gt; Media Archival Solution</b> setting). Maximum recording length 5 hours.</li> </ul> |
| <b>Meeting Arrival Announcement</b> | <p>Default = Off</p> <p>If enabled, the system plays this prompt to callers before they join the conference. If conference PIN codes have been defined, it is played before the request to the caller to enter their PIN code.</p> <ul style="list-style-type: none"> <li>• <b>Audio Output</b> – Use an uploaded audio file. See .The file must be a .wav file in Mono PCM 16-bit format, either 8, 16 or 22KHz. Maximum length 10 minutes. To upload a file click on <b>Upload</b> and select the required file. Alternatively, click and drag the file onto the download box.</li> <li>• <b>Text-to-Speech</b> – Use a prompt generated using TTS. Up to 200 characters.</li> </ul>                                                                                                    |

# Chapter 18: Auto Attendant (EVM)

## Call Management > Auto Attendants

These settings cover auto-attendants provided by embedded voicemail on IP500 V2 systems.

For auto-attendants provided by Voicemail Pro, see [Voicemail Pro Auto-Attendant Settings](#) on page 663.

For full details on configuration and operation of Embedded Voicemail auto-attendants, refer to *IP Office Embedded Voicemail Installation*.

Up to 40 auto-attendant services can be configured. Embedded voicemail services include auto-attendant, callers accessing mailboxes to leave or collect messages and announcements to callers waiting to be answered.

The IP500 V2 supports 2 simultaneous Embedded Voicemail calls by default but can be licensed for up to 6. The licensed limit applies to total number of callers leaving messages, collecting messages and or using an auto attendant.

In addition to basic mailbox functionality, embedded voicemail can also provide auto-attendant operation. Each auto attendant can use existing time profiles to select the greeting given to callers and then provide follow on actions relating to the key presses 0 to 9, \* and #.

## Time Profiles

Each auto attendant can use up to three existing time profiles, one for Morning, Afternoon and Evening. These are used to decide which greeting is played to callers. They do not change the actions selectable by callers within the auto attendant. If the time profiles overlap or create gaps, then the order of precedence used is morning, afternoon, evening.

## Greetings

Four different greetings are used for each auto attendant. One for each time profile period. This is then always followed by the greeting for the auto-attendant actions. By default a number of system short codes are automatically created to allow the recording of these greetings from a system extension. See below.

## Actions

Separate actions can be defined for the DTMF keys 0 to 9, \* and #. Actions include transfer to a specified destination, transfer to another auto-attendant transfer to a user extension specified by the caller (dial by number) and replaying the greetings.

- The **Fax** action can be used to reroute fax calls when fax tone is detected by the auto-attendant.
- The **Dial by Name** action can be used to let callers specify the transfer destination.

## Short Codes

Adding an auto attendant automatically adds a number of system short codes to assist in recording the auto-attendant prompt. These use the **Auto Attendant** short code feature.

- System short codes (\*81XX, \*82XX, \*83XX and \*84XX) are automatically added for use with all auto-attendants. These are used for morning, afternoon, evening and menu options greetings respectively. These short codes use a **Telephone Number** of the form "AA:"N".Y" where N is the replaced with the auto attendant number dialed and Y is 1, 2, 3 or 4 for the morning, afternoon, evening or menu option greeting.
- To add a short code to call an auto-attendant, omit the XX part. For example, add the short code \*80XX/Auto Attendant/"AA:"N if internal dialed access to auto-attendants is required.
- System short codes \*800XX, \*801XX, ..., \*809XX, \*850XX, and \*851XX are also automatically added for recording prompts for any **Page and Page** actions. The codes correspond to the key to which the action has been assigned; 0 to 9, \* and # respectively. These short codes use a **Telephone Number** of the form "AA:"N".00", ..., "AA:"N".01", "AA:"N".10" and "AA:"N".11" respectively.

## Routing Calls to the Auto Attendant

The telephone number format AA:Name can be used to route callers to an auto attendant. It can be used in the destination field of incoming call routes and telephone number field of short codes set to the **Auto Attend** feature. Note however that when used with a short code it should be enclosed in quotation marks, that is "AA:Name".

---

## Auto Attendant settings (EVM)

### Call Management > Auto Attendant > Add Auto Attendant

Auto-attendants are provided in 2 forms.

- These settings cover auto-attendants provided by embedded voicemail on IP500 V2 systems.
- For auto-attendants provided by Voicemail Pro, see [Voicemail Pro Auto-Attendant Settings](#) on page 663.

## Auto Attendant (EVM)

Navigation: **Call Management > Auto Attendant > Add Auto Attendant > Auto Attendant**

These settings cover auto-attendants provided by embedded voicemail on IP500 V2 systems. For auto-attendants provided by Voicemail Pro, see [Voicemail Pro Auto-Attendant Settings](#) on page 663.

These settings are used to define the name of the auto attendant service and the time profiles that should control which auto attendant greetings are played.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Field                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Morning/<br/>Afternoon/<br/>Evening/Menu<br/>Options</b> | <p>Each auto-attendant can consist of three distinct time periods, defined by associated time profiles. A greeting can be recorded for each period. The appropriate greeting is played to callers and followed by the Menu Options greeting which should list the available actions. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Time Profile</b> The time profile that defines each period of auto-attendant operation. When there are overlaps or gaps between time profiles, precedence is given in the order morning, afternoon and then evening.</li> <li>• <b>Short code</b> These fields indicate the system short codes automatically created to allow recording of the time profile greetings and the menu options prompt.</li> <li>• <b>Recording Name:</b> Default = Blank. Range = Up to 31 characters. No spaces.</li> </ul> <p>This field appears next to the short code used for manually recording auto-attendant prompts. It is only used is using pre-recorded wav files as greeting rather than manually recording greetings using the indicated short codes. If used, note that the field is case sensitive and uses the name embedded within the wav file header rather than the actual file name.</p> <p>This field can be used with all systems supporting Embedded Voicemail. The utility for converting .wav files to the correct format is provided with Manager and can be launched via <b>File &gt; Advanced &gt; LVM Greeting Utility</b>. Files then need to be manually transferred to the Embedded Voicemail memory card. For full details, see the <i>IP Office Embedded Voicemail Installation</i>.</p> |

## Actions (EVM)

Navigation: **Call Management > Auto Attendant > Add Auto Attendant > Actions**

These settings cover auto-attendants provided by embedded voicemail on IP500 V2 systems. For auto-attendants provided by Voicemail Pro, see [Voicemail Pro Auto-Attendant Settings](#) on page 663.

This tab defines the actions available to callers dependent on which DTMF key they press. To change an action, select the appropriate row and click **Edit**. When the key is configured as required click **OK**.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

If left as <b>Not Defined</b>, fax calls will follow the incoming call routes fallback settings once the auto-attendant Maximum Inactivity Time set on the Auto Attendant   Auto Attendant tab is reached.</p>                                                                                                                                                                                                                                                                                                              |
| <b>Action</b><br>The following actions can be assigned to each key. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Centrex Transfer</b>                                             | <p>Used to transfer the incoming call to an external telephone number defined in the <b>Transfer Number</b> field.</p> <p>Only supported for calls on Centrex analog trunks.</p> <p>This option is only supported with Embedded Voicemail.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Dial by Name</b>                                                 | <p>Callers are asked to dial the name of the user they require and then press #. The recorded name prompts of matching users are then played back for the caller to make a selection. The name order used is set by the <b>Dial by Name Match Order</b> setting on the Auto Attendant tab. Note the name used is the user's <b>Full Name</b> if set, otherwise their <b>User Name</b> is used. Users without a recorded name prompt or set to <b>Exclude From Directory</b> are not included. For Embedded Voicemail in IP Office mode, users can record their name by accessing their mailbox and dialing *05. For Embedded Voicemail in Intuity mode, users are prompted to record their name when they access their mailbox.</p> |
| <b>Dial By Number</b>                                               | <p>This option allows callers with DTMF phones to dial the extension number of the user they require. No destination is set for this option. The prompt for using this option should be included in the auto attendant Menu Options greeting. A uniform length of extension number is required for all users and hunt group numbers. The operation of this action is affected by the auto attendant's Direct Dial-by-Number setting.</p>                                                                                                                                                                                                                                                                                            |
| <b>Normal Transfer</b>                                              | <p>Can be used with or without a <b>Destination</b> set. When the <b>Destination</b> is not set, this action behaves as a <b>Dial By Number</b> action. With the <b>Destination</b> is set, this action waits for a connection before transferring the call. Callers can hear Music on Hold. Announcements are not heard.</p>                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Not Defined</b>                                                  | <p>The corresponding key takes no action.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Field                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Park &amp; Page</b>       | <p>The Park &amp; Page feature is supported when the system <b>Voicemail Type</b> is designated as <b>Embedded Voicemail</b> or <b>Voicemail Pro</b>. Park &amp; Page is also supported on systems where <b>Modular Messaging over SIP</b> is configured as the central voicemail system and the local <b>Embedded Voicemail</b> provides auto attendant operation. The Park &amp; Page feature is an option in user mailboxes where a key is configured with the Park &amp; Page feature. When an incoming call is answered by the voicemail system and the caller dials the DTMF digit for which Park &amp; Page is configured, the caller hears the Park &amp; Page prompt. IP Office parks the call and sends a page to the designated extension or hunt group. When Park &amp; Page is selected in the <b>Action</b> drop-down box, the following fields appear:</p> <ul style="list-style-type: none"> <li>• <b>Park Slot Prefix</b> – the desired Park Slot prefix number. Maximum is 8 digits. A 0-9 will be added to this prefix to form a complete Park Slot.</li> <li>• <b>Retry count</b> – number of page retries; the range is 0 to 5.</li> <li>• <b>Retry timeout</b> – provided in the format M:SS (minute:seconds). The range can be set in 15-second increments. The minimum setting is 15 seconds and the maximum setting is 5 minutes. The default setting is 15 seconds.</li> <li>• <b>Page prompt</b> – short code to record the page prompt or upload the recorded prompt. (Prompt can be uploaded to the SD card in the same way the AA prompts are).</li> </ul> |
| <b>Replay Menu Greeting</b>  | Replay the auto-attendant greetings again.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Transfer</b>              | Transfer the call to the selected destination. This is an unsupervised transfer, if the caller is not answered they will be handled as per a direct call to that number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Transfer to Attendant</b> | This action can be used to transfer calls to another existing auto attendant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Destination</b>           | <p>Sets the destination for the action.</p> <p>Destination can be a user, a hunt group or a short code.</p> <p>If the destination field is left blank, callers can dial the user extension number that they require. Note however that no prompt is provided for this option so it should be included in the auto attendant Menu Options greeting.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Consent Directive</b>     | <p>This field is used to control the addition of a consent value to the system's SMDR output and CTI call logging outputs. The intention is to allow the creation of auto-attendants where having been prompts for consent to some issue, the caller's response is included in the system call logs. It can be set to the following:</p> <ul style="list-style-type: none"> <li>• Not applicable: Set the consent value in the logging outputs to 0.</li> <li>• Consent Denied: Set the consent value in the logging outputs to 6.</li> <li>• Consent Given: Set the consent value in the logging outputs to 1.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

# Chapter 19: Auto Attendants (Voicemail Pro)

## Call Management > Auto Attendants (Voicemail Pro)

This section describes the auto-attendant settings used by systems using Voicemail Pro. For full details of auto-attendant operation, see [Voicemail Pro Auto-Attendants](#) on page 653.

For details of auto-attendants provided by embedded voicemail on IP500 V2 systems, see [Auto Attendant \(EVM\)](#) on page 260.

The auto-attendant settings are split into two tabs.

| Tab                    | Description                                                                                      |
|------------------------|--------------------------------------------------------------------------------------------------|
| <b>Auto Attendants</b> | This tab defines the general settings of the auto-attendant and its greetings and announcements. |
| <b>Action</b>          | This tab defines the functions provided by the individual telephone keys.                        |

## Auto Attendants

### Call Management > Auto Attendants (Voicemail Pro) > Auto Attendants

These settings are used to define the operation of the auto-attendant service whilst it waits for the caller to select an option from the configured actions.

For a visual summary of how these settings interact, see [Auto-Attendant Callflow](#) on page 656.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

## Auto-Attendant Settings

| Field                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>                 | <p>Range = Up to 12 characters</p> <p>The name for the auto-attendant. Set a name that acts as a reminder of the auto-attendants role. The name is then also shown in other menus used to route calls to the auto-attendant.</p>                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>AA Number</b>            | <p>This number is automatically assigned by the system and cannot be changed. It is used in conjunction with short codes to access the auto-attendant service or to record greetings.</p> <p>See <a href="#">Recording Auto-Attendant Prompts Using Short Codes</a> on page 683.</p> <ul style="list-style-type: none"> <li>• IP500 V2 systems support up to 40 auto-attendants.</li> <li>• IP Office Server Edition and Select systems support auto-attendants depending on the Voicemail channel limit of the server.</li> </ul>                                                                                                                           |
| <b>Maximum Inactivity</b>   | <p>Default = 8 seconds; Range = 1 to 20 seconds.</p> <p>This value sets how long the attendant should wait for a response from the caller after playing any current prompts.</p> <ul style="list-style-type: none"> <li>• If the caller responds, their response is checked for a match to a configured action without any further wait.</li> <li>• Note that the caller can respond whilst the prompts are playing.</li> <li>• If the timeout expires, the <b>Menu Loop Count</b> is checked to determine the next steps.</li> </ul>                                                                                                                        |
| <b>Name Match Order</b>     | <p>Default = Last then First</p> <p>This setting sets the name order used for the <b>Dial By Name</b> action if used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Direct By Number</b>     | <p>Default = No</p> <p>This setting affects the operation keys set to the <b>Dial By Number</b> action.</p> <ul style="list-style-type: none"> <li>• <b>If enabled:</b> The caller's key press to select the action is included in the digits they dial for a extension match. For example, if menu key 2 is used for the action, a caller can dial 2 and then 01 for extension 201.</li> <li>• <b>If not enabled:</b> The caller's key press to select the action is not included in the digits they dial for extension match. For example, if menu key 2 is used for the action, a caller must dial 2 and then 201 for extension 201.</li> </ul>           |
| <b>Direct By Conference</b> | <p>Default = No</p> <p>This setting affects the operation keys set to the <b>Dial By Conference</b> action.</p> <ul style="list-style-type: none"> <li>• <b>If enabled:</b> The caller's key press to select the action is included in the digits they dial for a conference match. For example, if menu key 3 is used for the action, a caller can dial 3 and then 01 for conference 301.</li> <li>• <b>If not enabled:</b> The caller's key press to select the action is not included in the digits they dial for a conference match. For example, if menu key 3 is used for the action, a caller must dial 3 and then 301 for conference 301.</li> </ul> |

It allows selection of a particular voice used for any text-to-speech features.</p> <p>See <a href="#">Text-to-Speech (TTS) Prompts</a> on page 654.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Greeting and Announcement Settings

When a caller reaches an auto-attendant, they first hear the attendant's current greeting (if any) and then the attendant's menu announcement.

- The greeting used is the first one (from up to 3 defined greetings) for which the greeting's associated time profile is currently active. This allows you to define greetings for different times of day (for example “*Good Morning*”, “*Good Afternoon*” and “*Sorry, we are currently closed*”) or different greetings for business and non-business days.
- The menu announcement should contain the instructions for the caller regarding the keys they can press and other actions.
- Each time a caller goes round the auto-attendant loop, they can respond (with key presses or speech) whilst any greeting and announcement menu prompt is being played.

| Field                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Optional Greeting 3</b> | <ul style="list-style-type: none"> <li>• If no greetings is currently active according to its time profile, then no greeting is played.</li> <li>• If a greeting is no longer required, it can be deleted by clicking on the adjacent  icon.</li> <li>• After playing any greeting, the system always then plays the menu announcement.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Menu Announcement</b>   | <p>The menu announcement should contain the instructions for callers about the actions they can perform. For example; <i>"Press 1 for reception. Press 2 for sales, ..."</i></p> <p>It is used as follows:</p> <ul style="list-style-type: none"> <li>• When a call first reaches the auto-attendant, it is played to the caller after whichever greeting is currently active.</li> <li>• If the <b>Menu Loop Count</b> is not zero, it is played again at the start of each repeat loop.</li> <li>• The caller can respond by pressing a key whilst the announcement is being played. On subscription mode systems, if <b>Speech AI</b> is enabled they can also respond by speaking whilst the announcement is played.</li> <li>• After the announcement is played, the auto-attendant waits for a response for the time set by the <b>Maximum Inactivity</b> setting.</li> </ul> |
| <b>Menu Loop Count</b>     | <p>Default = 0 (<i>No Repeat</i>)</p> <p>This setting sets the number of times the auto-attendant will repeat the <b>Menu Announcement</b> and then wait for a valid response.</p> <p>If the caller does not respond or their response is not matched to an action:</p> <ul style="list-style-type: none"> <li>• If 0, the default, they hear the <b>No Match Prompt</b> prompt and the <b>Fallback Action</b> setting is used.</li> <li>• If non-zero but the number of repeat loops has not been reached, they hear the <b>No Match Prompt</b> and then the <b>Menu Announcement</b> again and the auto-attendant waits for a response again.</li> <li>• If non-zero and the number of repeat loops has been reached, they hear the <b>No Match Prompt</b> prompt and the <b>Fallback Action</b> setting is used.</li> </ul>                                                      |
| <b>No Match Prompt</b>     | <p>This prompt is heard when the caller does not respond in time or if their response does not match a configured action. For example; <i>"Sorry, no response was recognized."</i></p> <ul style="list-style-type: none"> <li>• Note that this prompt is also heard by callers who are about to be redirected to the <b>Fallback Action</b>. Therefore a prompt like <i>"Please try again"</i> would not be appropriate.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

The following settings are common to the menu announcement, greetings and error message. The greetings and announcements can be recorded from the phone, use an uploaded file or be provided by text-to-speech. Whichever method was last used or configured overrides any previous prompt.

| Field                          | Description                                                                                                                                                                                                                                                                   |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Dial To Record Greeting</b> | <p>Default = Automatically assigned. Not changeable.</p> <p>This field indicates the short code that can be dialed in order to record the greeting from an internal extension.</p> <p>See <a href="#">Recording Auto-Attendant Prompts Using Short Codes</a> on page 683.</p> |

## Actions

### Call Management > Auto Attendants (Voicemail Pro) > Auto Attendants > Actions

This tab defines the actions available to callers dependent on which DTMF key they press or, on subscription mode systems, based on automatic speech recognition of keywords. To change an action, click on the appropriate button.

The **Fallback Action** action applied is the user does not make a recognized choice is configured separately through the **No Match Prompt** prompt settings.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

### Settings: Keys/Events

The following actions can be assigned to the selected keys.

| Action              | Description                                                                                                           |
|---------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>0 to 9, *, #</b> | These keys correspond to the standard telephone dial pad key. Clicking on a key allows configuration of its settings. |
| <b>Fax</b>          | If configured, the <b>Fax</b> option is used when the system detects fax tone.                                        |

| Action                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Fallback Action</b>   | <p>Default = Drop Call</p> <p>This option is used when the number of times the auto-attendant has waited for a valid response from the caller has exceeded the <b>Menu Loop Count</b>. It is preceded by the <b>No Match Prompt</b> and then the configured action is performed.</p> <p>All actions are supported except <b>Park &amp; Page</b>, <b>Replay Menu Greeting</b>, <b>Speak By Name</b> and <b>Speak By Number</b></p> <p>You can choose whether to mention this option in the <b>Menu Announcement</b>. For example, if set to transfer to your receptionist, add "... or wait to for our operator."</p>                                                                                                                                                                                                                                                         |
| <b>Menu Announcement</b> | <p>The menu announcement should contain the instructions for callers about the actions they can perform. For example; "Press 1 for reception. Press 2 for sales, ..."</p> <p>It is used as follows:</p> <ul style="list-style-type: none"> <li>• When a call first reaches the auto-attendant, it is played to the caller after whichever greeting is currently active.</li> <li>• If the <b>Menu Loop Count</b> is not zero, it is played again at the start of each repeat loop.</li> <li>• The caller can respond by pressing a key whilst the announcement is being played. On subscription mode systems, if <b>Speech AI</b> is enabled they can also respond by speaking whilst the announcement is played.</li> <li>• After the announcement is played, the auto-attendant waits for a response for the time set by the <b>Maximum Inactivity</b> setting.</li> </ul> |

### Settings: Key Actions

| Action                     | Description                                                                                                                     |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Not configured</b>      | Perform no action.                                                                                                              |
| <b>Dial By Conference</b>  | <p>Allow the caller to dial the conference ID they require.</p> <p>See <a href="#">Dial By Conference</a> on page 670.</p>      |
| <b>Dial By Name</b>        | <p>Prompt the caller to dial the name of the user they require.</p> <p>See <a href="#">Dial By Name</a> on page 671.</p>        |
| <b>Dial By Number</b>      | <p>Allow the caller to dial the extension number they require.</p> <p>See <a href="#">Dial By Number</a> on page 673.</p>       |
| <b>Leave Message</b>       | <p>Redirect the caller a specified mailbox to leave a message.</p> <p>See <a href="#">Leave Message</a> on page 674.</p>        |
| <b>Supervised Transfer</b> | <p>Transfer the caller to the specified extension number.</p> <p>See <a href="#">Supervised Transfer</a> on page 675.</p>       |
| <b>Park &amp; Page</b>     | <p>Park the call and make an announcement to the a specified group.</p> <p>See <a href="#">Park &amp; Page</a> on page 676.</p> |

| <b>Replay Menu Greeting</b>        | Replay the auto-attendant's menu announcement.<br>See <a href="#">Replay Menu</a> on page 678.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Unsupervised Transfer</b>       | Transfers the caller to the specified extension number.<br>See <a href="#">Unsupervised Transfer</a> on page 681.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Transfer To Auto Attendant</b>  | Transfers the caller to another auto-attendant.<br>See <a href="#">Transfer to Auto Attendant</a> on page 682.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Speak By Name</b>               | Allow the caller to select from listed names using speech.<br>See <a href="#">Speak By Name</a> on page 679.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Speak By Number</b>             | Allow the caller to speak the extension number required.<br>See <a href="#">Speak By Number</a> on page 680.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Destination</b>                 | The destination depends on the action: <ul style="list-style-type: none"> <li>• <b>Leave Message, Supervised Transfer and Unsupervised Transfer</b> – Use the drop-down to select the target extension.</li> <li>• <b>Transfer To Auto Attendant</b> – Use the drop-down to select another existing auto-attendant.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Speech Recognition Keywords</b> | This option is only available on subscription mode systems and when <b>Speech AI</b> is set to a specific language. It allows the action to be triggered by speech recognition of keywords. <ul style="list-style-type: none"> <li>• The keywords must be unique. The same word cannot be used for another key.</li> <li>• Up to 3 keywords are supported per key, separated by commas. Note that using more keywords in total reduces the chances of a match.</li> <li>• Avoid using proper names. These are less likely to be matched as they may not match existing words in the speech recognition dictionaries used by Google.</li> <li>• Encourage matches by ensuring that the keywords are part of the announcements played to callers. For example, "Say whether you want Sales or Support" rather than "Say what department you want".</li> </ul> |
| <b>Consent Directive</b>           | When a caller selects a particular action, the actions <b>Consent Directive</b> value is included in the system logs. These options allow you record whether the caller has indicated their consent to some action, for example call recording.<br>See <a href="#">Auto-Attendant Consent Example</a> on page 657. <ul style="list-style-type: none"> <li>• <b>Consent Not Applicable</b> – Indicates that the caller has not been prompted to select whether they consent to call recording.</li> <li>• <b>Consent Given</b> – Indicates that the caller has been prompted for their consent and has consented.</li> <li>• <b>Consent Denied</b> – Indicates that the caller has been prompted for their consent and has not consented.</li> </ul>                                                                                                         |

# Part 4: The System Settings Menu

## System Settings

### System Settings

This drop-down provides access to the menus for configuring the features supported by the IP Office telephony service.

- The menus for configuring auto-attendants, conferences, users, groups and extensions are accessed via the **Call Management** menu.

The menu provides access to the configuration records of users, extensions, group, system conferences and auto-attendants. The lists can be used to add, edit and delete those records.

| Menu/Sub-Menu                    | Description                                                                                                                                                                                                                                                                                                                      |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Account Code</b>              | Account codes can be used to track calls. Users can either voluntarily enter an account code during a call, or for certain numbers, be forced to enter a valid account code in order to make a call.                                                                                                                             |
| <b>Alternate Route Selection</b> | Alternate Route Selection (ARS) records are used to control the routing of outgoing calls. Short codes within the ARS record are matched against the number to dial to see which line to use or whether it is barred and to change the number actually dialed from the system if necessary.                                      |
| <b>Authorization Code</b>        | Each authorization code is associated with a particular user. That code allows the user to temporarily override the settings of another user's phone and make a call from it using their own settings.                                                                                                                           |
| <b>Firewall Profile</b>          | Configure firewall profiles which can then be applied to IP connections.                                                                                                                                                                                                                                                         |
| <b>Incoming Call Route</b>       | Incoming call routes records are used to control the routing of incoming calls. Various aspects of the incoming call (for example the line it is on and the caller ID) are compared for matches to the available ICR records. The destination settings in the ICR record that is the best match are then used to route the call. |
| <b>IP Route</b>                  | This menu is used to configure static IP routes to control the routing of matching IP addresses and address ranges.                                                                                                                                                                                                              |
| <b>Licenses</b>                  | This menu is used to configure the license source settings on non-subscription systems.                                                                                                                                                                                                                                          |
| <b>Line</b>                      | Lines are used for external calls, both incoming and outgoing.                                                                                                                                                                                                                                                                   |

*Table continues...*

| Menu/Sub-Menu           | Description                                                                                                                                                                                                                                                                                      |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Locations</b>        | Location records can be used to identify where particular extensions are physically located and to apply settings that need to differ from that location.                                                                                                                                        |
| <b>RAS</b>              | A Remote Access Server (RAS) is a piece of computer hardware which sits on a corporate LAN and into which employees dial on the public switched telephone network to get access to their email and to software and data on the corporate LAN.                                                    |
| <b>Services</b>         | Services are used to configure the settings required when a user or device on the LAN needs to connect to a another network. Services can be used when making data connections via trunk or WAN interfaces. Once a service is created, it can be used as the destination for an IP Route record. |
| <b>Short Codes</b>      | Dialing by users on the system can be compared to short codes. When a match occurs, the matching short code sets what should happen. This may be the triggering of some feature, changing a system setting, or changing the dialed number.                                                       |
| <b>Subscription</b>     | On subscription mode systems, display the subscriptions obtained and the settings used.                                                                                                                                                                                                          |
| <b>System Directory</b> | The system directory contains records for external contacts, that is their names and numbers. These can be displayed on phones in order to make outgoing calls. They can also be used to match a name to the number on incoming calls.                                                           |
| <b>System</b>           | This menu gives access to a set of sub-menus for settings that control system-wide behavior.                                                                                                                                                                                                     |
| <b>Time Profiles</b>    | Time profiles contains time, date and weekly schedule settings. Using those each time profile is currently either 'true' or 'false'. That value is used to change the behavior of other types of record that can be linked to the time profile such as incoming call routes.                     |
| <b>Tunnel</b>           | These menus can be used to create L2TP and IPSec tunnels to other servers and services. Supported on IP Office IP500 V2 systems only.                                                                                                                                                            |
| <b>User Rights</b>      | User rights can be used to override some of the individual settings of some users. Changes to the user rights are then automatically applied to all those users rather than having to individually edit each user.                                                                               |
| <b>WAN Port</b>         | Use these menus to configure physical and virtual WAN ports.                                                                                                                                                                                                                                     |

# Chapter 20: Account Code

## System Settings > Account Code

### Additional configuration information

This section provides the **Account Code** field descriptions. For additional configuration information, see [Configuring Account Codes](#) on page 844.

Account codes are commonly used to control cost allocation and out-going call restriction. The IP Office can use account codes in a number of ways.

- When making calls, users can voluntarily enter an account code.
  - On phones that support programmable buttons, users can do this using an **Account Code Entry** button.
  - A short code set to **Set Account Code** can also be used to enter an account code before making a call.
- If the number dialed for an outgoing call matches a short code set to **Forced Account Code**, the user is required to enter a valid account code in order to continue the call.
- Individual users can be set to **Forced Account Code (User > Telephony > Supervisor Settings)**. They then need to enter an account code for any outgoing external calls.
- Incoming calls can also be associated with an account code by matching the Caller ID stored with the account code settings. That account code is then included in the call's SMDR call log.

When an account code is entered during a call:

- The IP Office checks the code entered for a match against those account codes set in its configuration. For **Forced Account Code** calls, the call is not allowed until a valid code is entered.
- If the code is valid, it is included in the information output by the system's SMDR call log.
- The account code used on a call is not included in the user's personal call log. This means that re-dial functions will not re-enter the account code.
- If more than one account code is entered during a call, only the last code entered is included in the SMDR call log.

An IP Office system can support up to 1500 configured account codes.

- Wildcards can be used in the account codes configured to expand the supported range. For example, a single account code entry 9?? allows dialing any number between 900 and 999 to be treated as a valid account code.
- By default, in Server Edition/Select networks, account codes are configured at the network level and automatically replicated in the configuration of all systems in the network. That is, the 1500 account code limit applies to the whole network. They can only be seen and edited

at the individual system configuration level if record consolidation is switched off. See [Record Consolidation](#) on page 54.

**Bulk delete:** You can delete multiple records. Select the check box to the right of each record you want to delete and click **Delete**. You receive a prompt to confirm the deletion.

---

## Account Code

Navigation: **System Settings > Account Code > Add/Edit Account Code > Account Code**

These settings can be edited online. Changes to these settings do not require a reboot of the system.

For a Server Edition network, these settings can be configured at the network level and are then automatically replicated in the configuration of all systems in the network. They can only be seen and edited at the individual system configuration level if record consolidation is switched off.

| Field               | Descriptions                                                                                                             |
|---------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Account Code</b> | Enter the account code required. It can also include wildcards; ? matches a single digit and * matches any digits.       |
| <b>Caller ID</b>    | A caller ID can be entered and used to automatically assign an account code to calls made to or received from caller ID. |

## Voicemail Recording

Navigation: **System Settings > Account Code > Add/Edit Account Code > Voicemail Recording**

These settings are used to activate the automatic recording of external calls when the account code is entered at the start of the call.

- Call recording requires Voicemail Pro to be installed and running. Call recording also requires available conference resources similar to a 3-way conference.
- Call recording starts when the call is answered.
- Call recording is paused when the call is parked or held. It restarts when the call is unparked or taken off hold. This does not apply to SIP terminals.
- Calls to and from IP devices, including those using Direct media, can be recorded.

- Recording continues for the duration of the call or up to the maximum recording time configured on the voicemail server.
- Recording is stopped when the call ends or if:
  - User call recording stops if the call is transferred to another user.
  - Account code call recording stops if the call is transferred to another user.
  - Hunt group call recording stops if the call is transferred to another user who is not a member of the hunt group.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

For a Server Edition network, these settings can be configured at the network level and are then automatically replicated in the configuration of all systems in the network. They can only be seen and edited at the individual system configuration level if record consolidation is switched off.

| Field                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Record Outbound</b>     | <p>Default = None</p> <p>Select whether automatic recording of outgoing calls is enabled. The Auto Record Calls option sets whether just external calls or external and internal calls are included. The options are:</p> <ul style="list-style-type: none"> <li>• <b>None:</b> Do not automatically record calls.</li> <li>• <b>On:</b> Record the call if possible. Otherwise, allow the call to continue without recording.</li> <li>• <b>Mandatory:</b> Record the call if possible. Otherwise, block the call and return busy tone.</li> <li>• <b>Percentages of calls:</b> Record a selected percentages of the calls.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Record Time Profile</b> | <p>Default = &lt;None&gt; (Any time)</p> <p>Used to select a time profile during which automatic call recording of incoming calls is applied. If no profile is selected, automatic recording is always active.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Recording (Auto)</b>    | <p>Default = Mailbox</p> <p>Sets the destination for automatically triggered recordings. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Mailbox</b> This option sets the destination for the recording to be a selected user or hunt group mailbox. The adjacent drop down list is used to select the mailbox.</li> <li>• <b>Voice Recording Library:</b> This option set the destination for the recording to be a VRL folder on the voicemail server. The VRL application polls that folder and collects waiting recordings which it then places in its archive. Recording is still done by Voicemail Pro.</li> <li>• <b>Voice Recording Library Authenticated:</b> This option is similar to the above but instructs the voicemail server to create an authenticated recording. If the file contents are changed, the file is invalidated though it can still be played.           <ul style="list-style-type: none"> <li>- For systems recording to .opus format (the default), both settings create authenticated recordings.</li> </ul> </li> </ul> |

# Chapter 21: Alternate Route Selection

## System Settings > Alternate Route Selection

Alternate Route Selection (ARS) records are used to control the routing of outgoing calls. Short codes within the ARS record are matched against the number to dial to see which line to use or whether it is barred and to change the number actually dialed from the system if necessary.

Click **Add/Edit Alternate Route** to open the Create Alternate Route page where you can provision a location. When you click **Add/Edit Alternate Route**, you are prompted to specify a server.

## Add Alternate Route

Navigation: **System Settings > Alternate Route Selection > Add/Edit Alternate Route**

### Additional configuration information

See [Configuring ARS](#) on page 813.

This type of configuration record can be saved as a template and new records created from a template. See [Working with Templates](#) on page 810.

### Configuration settings

Each ARS form contains short codes which are used to match the result of the short code that triggered use of the ARS form, ie. the Telephone Number resulting from the short code is used rather than the original number dialed by the user.

For Server Edition, this type of configuration record can be saved as a template and new records created from a template.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field        | Description                                                                                                                                                                                                                                                     |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ARS Route ID | The default value is automatically assigned. Range = 0 to 99999.<br>For most deployments, do not edit this field.<br>For those conditions where it is necessary to edit this field, the value must be unique within ARS and within the line Outbound Group IDs. |

| <b>Route Name</b>              | <p>Default = Blank. Range = Up to 15 characters.</p> <p>The name is used for reference and is displayed in other areas when selecting which ARS to use.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Dial Delay Time</b>         | <p>Default = System. Range = 1 to 30 seconds.</p> <p>This settings defines how long ARS should wait for further dialing digits before assuming that dialing is complete and looking for a short code match against the ARS form short codes. When set to <b>System</b>, the system setting <b>System Settings &gt; System &gt; Telephony &gt; Dial Delay Time</b> is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Secondary Dial Tone</b>     | <p>Defaults = Off.</p> <p>When on, this setting instructs the system to play secondary dial tone to the user. The tone used is set by the field below.</p> <p>The tone used is set as either <b>System Tone</b> (normal dial tone) or <b>Network Tone</b> (secondary dial tone). Both tone types are generated by the system in accordance with the system specific locale setting. Note that in some locales normal dial tone and secondary dial tone are the same.</p> <p>When <b>Secondary Dial Tone</b> is selected, the ARS form will return tone until it receives digits with which it can begin short code matching. Those digits can be the result of user dialing or digits passed by the short code which invoked the ARS form. For example with the following system short codes:</p> <p>In this example, the 9 is stripped from the dialed number and is not part of the telephone number passed to the ARS form. So in this case secondary dial tone is given until the user dials another digit or dialing times out.</p> <ul style="list-style-type: none"> <li>• <b>Code:</b> 9N</li> <li>• <b>Telephone Number:</b> N</li> <li>• <b>Line Group ID:</b> 50 Main</li> </ul> <p>In this example, the dialed 9 is included in the telephone number passed to the ARS form. This will inhibit the use of secondary dial tone even if secondary dial tone is selected on the ARS form.</p> <ul style="list-style-type: none"> <li>• <b>Code:</b> 9N</li> <li>• <b>Telephone Number:</b> 9N</li> <li>• <b>Line Group ID:</b> 50 Main</li> </ul> |
| <b>Check User Call Barring</b> | <p>Default = Off</p> <p>If enabled, the dialing user's <b>Outgoing Call Bar</b> setting and any user short codes set to the function <b>Barred</b> are checked to see whether they are appropriate and should be used to bar the call.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>             | <p>Default = Blank. Maximum 31 characters.</p> <p>You can use this field to enter a description for the configuration entry. The description is not used elsewhere.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>In Service:</b>               | <p>Default = On</p> <p>This field is used to indicate whether the ARS form is in or out of service. When out of service, calls are rerouted to the ARS form selected in the <b>Out of Service Route</b> field.</p> <p>Short codes can be used to take an ARS form in and out of service. This is done using the short code features Disable ARS Form and Enable ARS Form and entering the ARS Route ID as the short code <b>Telephone Number</b> value.</p>                                                                                                                                                                                                                                                                                                                  |
| <b>Out of Service Route</b>      | <p>Default = None.</p> <p>This is the alternate ARS form used to route calls when this ARS form is not in service.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Time Profile</b>              | <p>Default = None.</p> <p>Use of a ARS form can be controlled by an associate time profile. Outside the hours defined within the time profile, calls are rerouted to an alternate ARS form specified in the Out of Hours Route drop-down. Note that the Time Profile field cannot be set until an Out of Hours Route is selected.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Out of Hours Route</b>        | <p>Default = None.</p> <p>This is the alternate ARS form used to route calls outside the hours defined within the Time Profile selected above.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Short Codes</b>               | <p>Short codes within the ARS form are matched against the "Telephone Number" output by the short code that routed the call to ARS. The system then looks for another match using the short codes with the ARS form.</p> <p>Only short codes using the following features are supported within ARS: <b>Dial</b>, <b>Dial Emergency</b>, <b>Dial Speech</b>, <b>Dial 56K</b>, <b>Dial64K</b>, <b>Dial3K1</b>, <b>DialVideo</b>, <b>DialV110</b>, <b>DialV120</b> and <b>Busy</b>.</p> <p>Multiple short codes with the same <b>Code</b> field can be entered so long as they have differing <b>Telephone Number</b> and or <b>Line Group ID</b> settings. In this case when a match occurs the system will use the first match that points to a route which is available.</p> |
| <b>Alternate Route Priority</b>  | <p>Default = 3. Range = 1 (low) to 5 (high).</p> <p>If the routes specified by this form are not available and an <b>Alternate Route</b> has been specified, that route will be used if the users priority is equal to or higher than the value set here. User priority is set through the <b>Call Management &gt; Users &gt; Add/Edit Users &gt; User</b> form and by default is <b>5</b>. If the users priority is lower than this value, the <b>Alternate Route Wait Time</b> is applied. This field is grayed out and not used if an ARS form has not been selected in the <b>Alternate Route</b> field.</p> <p>If the caller's dialing matches a short code set to the <b>Barred</b> function, the call remains at that short code and is not escalated in any way.</p> |
| <b>Alternate Route Wait Time</b> | <p>Default = 30 seconds. Range = Off, 5 to 60 seconds.</p> <p>If the routes specified by this form are not available and an <b>Alternate Route</b> has been specified, users with insufficient priority to use the alternate route immediately must wait for the period defined by this value. During the wait the user hears camp on tone. If during that period a route becomes available it is used. This field is grayed out and not used if an ARS form has not been selected in the <b>Alternate Route</b> field.</p>                                                                                                                                                                                                                                                  |

| Field                  | Description                                                                                                                                                                                                                                          |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Alternate Route</b> | <p>Default = None.</p> <p>This field is used when the route or routes specified by the short codes are not available. The routes it specifies are checked in addition to those in this ARS form and the first route to become available is used.</p> |

### Cause Codes and ARS

ARS routing to digital trunks can be affected by signalling from the trunk.

The following cause codes cause ARS to no longer target the line group (unless it is specified by an alternate ARS route). The response to cause codes received from the line is as follows.

| Code | Cause Code                                                           |
|------|----------------------------------------------------------------------|
| 1    | Unallocated Number.                                                  |
| 2    | No route to specific transit network/(5ESS) Calling party off hold.  |
| 3    | No route to destination./(5ESS) Calling party dropped while on hold. |
| 4    | Send special information tone/(NI-2) Vacant Code.                    |
| 5    | Misdialed trunk prefix.                                              |
| 8    | Preemption/(NI-2) Prefix 0 dialed in error.                          |
| 9    | Preemption, cct reserved/ (NI-2) Prefix 1 dialed in error.           |
| 10   | (NI-2) Prefix 1 not dialed.                                          |
| 11   | (NI-2) Excessive digits received call proceeding.                    |
| 22   | Number Changed.                                                      |
| 28   | Invalid Format Number.                                               |
| 29   | Facility Rejected.                                                   |
| 50   | Requested Facility Not Subscribed.                                   |
| 52   | Outgoing calls barred.                                               |
| 57   | Bearer Capability Not Authorized.                                    |
| 63   | Service or Option Unavailable.                                       |

# Chapter 22: Authorization Code

## System Settings > Authorization Code

Each authorization code is associated with a particular user. That code allows the user to temporarily override the settings of another users phone and make a call from it using their own settings.

Click **Add/Edit Authorization Code** to open the Authorization Codes page where you can provision an authorization code. When you click **Add/Edit Authorization Code**, you are prompted to specify the server where the authorization code will be applied.

### Related links

[Add Authorization Code](#) on page 283

---

## Add Authorization Code

Navigation: **System Settings > Authorization Code > Add/Edit Authorization Code**

When a user dials an external number that matches a short code set to **Force Authorization Code**, the IP Office system will prompt the user to enter their associated **Authorization Code** before allowing the call to continue.

Valid/invalid authorization code entry is recorded in the SMDR output. The code used is not recorded.

These settings are mergeable. Changes to these settings do not require a reboot of the system.

### **Note:**

For Release 9.1 and higher, you can no longer associate **Authorization Code** entries with **User Rights**. **Authorization Code** configured in that way are removed during the upgrade.

| Field                     | Description                                                                                                                                                        |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Authorization Code</b> | Range = Up to 12 digits.<br><br>The digits used for the authorization code. Each code must be unique. Wildcards are not usable with authorization codes.           |
| <b>User</b>               | This field is used to select a user with which the authorization code is associated. The authorization code can then be used to authorize calls made by that user. |

# Chapter 23: Firewall Profile

## System Settings > Firewall Profile

Configure firewall profiles which can then be applied to IP connections.

Click **Add/Edit Firewall Profile** to open the Add Firewall page where you can provision a firewall. When you click **Add/Edit Firewall Profile**, you are prompted to specify the server where the firewall will be applied.

### Additional configuration information

This type of configuration record can be saved as a template and new records created from a template. See [Working with Templates](#) on page 810.

### Configuration settings

The IP Office system can act as a firewall, allowing only specified data traffic to start a session across the firewall and controlling in which direction such sessions can be started.

You can select a firewall profiles for the following areas of IP Office operation:

- You can apply a firewall profile to traffic between LAN1 and LAN2.
- You can select a firewall for users who are the destination of incoming RAS calls.
- You can select a firewall when you configure a service.

### Note:

- The IP Office firewall profiles can include Static network address translation (NAT) records. If the firewall profile contains any Static NAT records, the IP Office blocks traffic that does not match one of those static NAT records.
- If Network Address Translation (NAT) is used with the firewall, you must configure the **Primary Trans. IP Address** setting on incoming services (**System Settings > Services > Add/Edit Service > Normal / WAN / Internet**).

- On Linux-based systems, to ensure that the firewall starts after a reboot, you must enable the **Solution > ≡ > Platform View > Settings > System > Firewall Settings > Activate** option.

By default, any protocol not listed in the standard firewall list is dropped unless a custom firewall entry is configured for that protocol.

These settings are mergeable. Changes to these settings do not require a reboot of the system.

| Field                   | Description                                                                                                                                                                                                                                                                                                |                |                                     |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-------------------------------------|
| <b>Name</b>             | Range = Up to 15 characters. Enter the name to identify this profile.                                                                                                                                                                                                                                      |                |                                     |
| <b>Protocol Control</b> | For each of the listed protocols, the options <b>Drop</b> , <b>In</b> (Incoming traffic can start a session), <b>Out</b> (Outgoing traffic can start a session) and <b>Both Directions</b> can be selected. Once a session is started, return traffic for that session is also able to cross the firewall. |                |                                     |

# Chapter 24: Incoming Call Route

## System Settings > Incoming Call Route

Incoming call routes records are used to control the routing of incoming calls. Various aspects of the incoming call (for example the line it is on and the caller ID) are compared for matches to the available ICR records. The destination settings in the ICR record that is the best match are then used to route the call.

- Click **Add/Edit Incoming Call Route** to add an incoming call route. When you click **Add/Edit Incoming Call Route**, you are prompted to specify a server where the route will be configured.
- Click **MSN Configuration** to populate the incoming call route table with MSN or DID numbers. When you click **MSN Configuration**, you are prompted to specify a server.

## Add Incoming Call Route

Navigation: **System Settings > Incoming Call Route > Add/Edit Incoming Call Route**

Incoming call routes are used to determine the destination of voice and data calls received by the system. On systems where a large number incoming call routes need to be setup for DID numbers, the MSN/DID Configuration tool can be used.

Calls received on IP, S0 and QSIG trunks do not use incoming call routes. Routing for these is based on incoming number received as if dialed on-switch. Line short codes on those trunks can be used to modify the incoming digits.

For a Server Edition network, these settings can be configured at the network level and are then automatically replicated in the configuration of all systems in the network. They can only be seen and edited at the individual system configuration level if record consolidation is switched off.

Determining which incoming call route is used is based on the call matching a number of possible criteria. In order of highest priority first, the criteria, which if set must be matched by the call in order for the call to use that route are:

1. The **Bearer Capability** indicated, if any, with the call. For example whether the call is a voice, data or video call.
2. The **Incoming Group ID** of the trunk or trunk channel on which the call was received.
3. The **Incoming Number** received with the call.

4. The **Incoming Sub Address** received with the call.
5. The **Incoming CLI** of the caller.

### Multiple Matches

If there is a match between more than one incoming call route record, the one added to the configuration first is used.

### Incoming Call Route Destinations

Each incoming route can include a fallback destination for when the primary destination is busy. It can also include a time profile which control when the primary destination is used. Outside the time profile calls are redirected to a night service destination. Multiple time profiles can be associated with an incoming call route. Each time profile used has its own destination and fallback destination specified.

### Incoming Call Routing Examples

#### Example 1

For this example, the customer has subscribes to receive two 2-digit DID numbers. They want calls on one routed to a Sales hunt group and calls on the other to a Services hunt group. Other calls should use the normal default route to hunt group Main. The following incoming call routes were added to the configuration to achieve this:

| Line Group | Incoming Number | Destination |
|------------|-----------------|-------------|
| 0          | 77              | Sales       |
| 0          | 88              | Services    |
| 0          | blank           | Main        |

Note that the incoming numbers could have been entered as the full dialed number, for example 7325551177 and 7325551188 respectively. The result would still remain the same as incoming number matching is done from right-to-left.

| Line Group | Incoming Number | Destination |
|------------|-----------------|-------------|
| 0          | 7325551177      | Sales       |
| 0          | 7325551188      | Services    |
| 0          | blank           | Main        |

#### Example 2

In the example below the incoming number digits 77 are received. The incoming call route records 677 and 77 have the same number of matching digit place and no non-matching places so both a potential matches. In this scenario the system will use the incoming call route with the Incoming Number specified for matching.

| Line Group | Incoming Number | Destination |
|------------|-----------------|-------------|
| 0          | 677             | Support     |
| 0          | 77              | Sales       |
| 0          | 7               | Services    |
| 0          | blank           | Main        |

**Example 3**

In the following example, the 677 record is used as the match for 77 as it has more matching digits than the 7 record and no non-matching digits.

| Line Group | Incoming Number | Destination |
|------------|-----------------|-------------|
| 0          | 677             | Support     |
| 0          | 7               | Services    |
| 0          | blank           | Main        |

**Example 4**

In this example the digits 777 are received. The 677 record had a non-matching digit, so it is not a match. The 7 record is used as it has one matching digit and no non-matching digits.

| Line Group | Incoming Number | Destination |
|------------|-----------------|-------------|
| 0          | 677             | Support     |
| 0          | 7               | Services    |
| 0          | blank           | Main        |

**Example 5**

In this example the digits 77 are received. Both the additional incoming call routes are potential matches. In this case the route with the shorter Incoming Number specified for matching is used and the call is routed to **Services**.

| Line Group | Incoming Number | Destination |
|------------|-----------------|-------------|
| 0          | 98XXX           | Support     |
| 0          | 8XXX            | Services    |
| 0          | blank           | Main        |

**Example 6**

In this example two incoming call routes have been added, one for incoming number 6XXX and one for incoming number 8XXX. In this case, any three digit incoming numbers will potential match both routes. When this occurs, potential match that was added to the system configuration first is used. If 4 or more digits were received then an exact matching or non-matching would occur.

| Line Group | Incoming Number | Destination |
|------------|-----------------|-------------|
| 0          | 6XXX            | Support     |
| 0          | 8XXX            | Services    |
| 0          | blank           | Main        |

## Incoming Call Route General Settings

Navigation: **System Settings > Incoming Call Route > Add/Edit Incoming Call Route**

### Additional configuration information

For additional information on the **Tag** setting, see [Call Tagging](#) on page 841.

Incoming call routes are used to match call received with destinations. Routes can be based on the incoming line group, the type of call, incoming digits or the caller's ICLID. If a range of MSN/DID numbers has been issued, this form can be populated using the MSN Configuration tool. In Manager, see **Tools > MSN Configuration**.

### Default Blank Call Routes

By default the configuration contains two incoming calls routes; one set for **Any Voice** calls (including analog modem) and one for **Any Data** calls. While the destination of these default routes can be changed, it is strongly recommended that the default routes are not deleted.

- Deleting the default call routes, may cause busy tone to be returned to any incoming external call that does not match any incoming call route.
- Setting any route to a blank destination field, may cause the incoming number to be checked against system short codes for a match. This may lead to the call being rerouted off-switch.

Calls received on IP, S0 and QSIG trunks do not use incoming call routes. Routing for these is based on incoming number received as if dialed on-switch. Line short codes on those trunks can be used to modify the incoming digits.

If there is no matching incoming call route for a call, matching is attempted against system short codes and finally against voicemail nodes before the call is dropped.

### SIP Calls

For SIP calls, the following fields are used for call matching:

- **Line Group ID** This field is matched against the **Incoming Group** settings of the SIP URI (Line | SIP URI). This must be an exact match.
- **Incoming Number** This field can be used to match the called details (TO) in the SIP header of incoming calls. It can contain a number, SIP URI or Tel URI. For SIP URI's the domain part of the URI is removed before matching by incoming call routing occurs. For example, for the SIP URI mysip@example.com , only the user part of the URI, ie. mysip, is used for matching.

The Call Routing Method setting of the SIP line can be used to select whether the value used for incoming number matching is taken from the **To Header** or the **Request URI** information provided with incoming calls on that line.

**Incoming CLI** This field can be used to match the calling details (FROM) in the SDP header of incoming SIP calls. It can contain a number, SIP URI, Tel URI or IP address received with SIP calls. For all types of incoming CLI except IP addresses a partial record can be used to achieve the match, records being read from left to right. For IP addresses only full record matching is supported.

### Configuration Settings

These settings can be edited online. Changes to these settings do not require a reboot of the system.

For a Server Edition network, these settings can be configured at the network level and are then automatically replicated in the configuration of all systems in the network. They can only be seen and edited at the individual system configuration level if record consolidation is switched off.

### Incoming Call Matching Fields:

The following fields are used to determine if the Incoming Call Route is a potential match for the incoming call. By default the fields are used for matching in the order shown starting with **Bearer Capability**.

| Field                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Line Group ID</b>   | <p>Default = 0. Range = 0 to 99999.</p> <p>Matches against the Incoming Line Group to which the trunk receiving the call belongs.</p> <p>For Server Edition systems, the default value <b>0</b> is not allowed. You must change the default value and enter the unique <b>Line Group ID</b> for the line.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Incoming Number</b> | <p>Default = Blank (Match any unspecified)</p> <p>Matches to the digits presented by the line provider. A blank record matches all calls that do not match other records. By default this is a right-to-left matching. The options are:</p> <ul style="list-style-type: none"> <li>• <b>* = Incoming CLI Matching Takes Precedence</b></li> <li>• <b>- = Left-to-Right Exact Length Matching</b> Using a - in front of the number causes a left-to-right match. When left-to-right matching is used, the number match must be the same length. For example -96XXX will match a DID of 96000 but not 9600 or 960000.</li> <li>• <b>X = Single Digit Wildcard</b> Use X's to enter a single digit wild card character. For example <b>91XXXXXXXXX</b> will only match DID numbers of at least 10 digits and starting with 91, <b>-91XXXXXXXXX</b> would only match numbers of exactly 10 digits starting with 91. Other wildcard such as <b>N</b>, <b>n</b> and <b>?</b> cannot be used.</li> </ul> <p>Where the incoming number potentially matches two incoming call routes with X wildcards and the number of incoming number digits is shorter than the number of wildcards, the one with the shorter overall <b>Incoming Number</b> specified for matching is used.</p> <ul style="list-style-type: none"> <li>• <b>i = ISDN Calling Party Number 'National'</b> The i character does not affect the incoming number matching. It is used for Outgoing Caller ID Matching, see notes below.</li> </ul> |

| <b>Incoming CLI</b> | <p>Default = Blank (Match all)</p> <p>Enter a number to match the caller's number (ICLID) provided with the call. This field is matched left-to-right. The number options are:</p> <ul style="list-style-type: none"> <li>• Full telephone number.</li> <li>• Partial telephone number, for example just the area code.</li> <li>• ! : Matches calls where the ICLID was withheld.</li> <li>• ? : for number unavailable.</li> <li>• For SIP call on a line using calling number verification, the characters P, F and Q can be used to match calls that have passed authentication, failed authentication or were unauthenticated respectively.</li> </ul> <p>See <a href="#">SIP Calling Number Verification (STIR/SHAKEN)</a> on page 967.</p> <ul style="list-style-type: none"> <li>• Blank for all.</li> </ul> |

### Call Setting Fields:

For calls routed using this Incoming Call Route, the settings of the following fields are applied to the call regardless of the destination.

| Field           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Locale</b>   | <p>Default = Blank (Use system setting)</p> <p>This option specifies the language prompts, if available, that voicemail should use for the call if it is directed to voicemail.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Priority</b> | <p>Default = 1-Low. Range = 1-Low to 3-High.</p> <p>This setting allows incoming calls to be assigned a priority. Other calls such as internal calls are assigned priority <b>1-Low</b></p> <p>In situations where calls are queued, high priority calls are placed before calls of a lower priority. This has a number of effects:</p> <ul style="list-style-type: none"> <li>• Mixing calls of different priority is not recommended for destinations where Voicemail Pro is being used to provide queue ETA and queue position messages to callers since those values will no longer be accurate when a higher priority call is placed into the queue. Note also that Voicemail Pro will not allow a value already announced to an existing caller to increase.</li> <li>• If the addition of a higher priority call causes the queue length to exceed the hunt group's Queue Length Limit, the limit is temporarily raised by 1. This means that calls already queued are not rerouted by the addition of a higher priority call into the queue.</li> </ul> <p>A timer can be used to increase the priority of queued calls, see the setting <b>System   Telephony   Telephony   Call Priority Promotion Time</b> <b>System Settings &gt; System &gt; Telephony &gt; Call Priority Promotion Time</b>.</p> <p>The current priority of a call can be changed through the use of the <b>p</b> short code character in a short code used to transfer the call.</p> |

| Field                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Tag</b>                | Default = Blank (No tag).<br><br>Allows a text tag to be associated with calls routed by this incoming call route. This tag is displayed with the call within applications and on phone displays.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Hold Music Source</b>  | Default = System source.<br><br>The system can support several music on hold sources. See <b>System Settings &gt; System &gt; Telephony &gt; Tones and Music</b> .<br><br>If the system has several hold music sources available, this field allows selection of the source to associate with calls routed by this incoming call route. The new source selection will then apply even if the call is forwarded or transferred away from the Incoming Call Route destination. If the call is routed to another system in a multi-site network, the matching source on that system is used if available. The hold music source associated with a call can also be changed by a hunt group's Hold Music Source setting. |
| <b>Ring Tone Override</b> | Default = Blank<br><br>If ring tones have been configured in <b>System Settings &gt; System &gt; Telephony &gt; Ring Tones</b> , they are available in this list. Setting a ring tone override applies a unique ring tone for the incoming call route. Ring tone override features are only supported on 1400, 9400, 9500, and J100 Series (except J129) phones.                                                                                                                                                                                                                                                                                                                                                     |

## Outgoing Caller ID Matching

In cases where a particular Incoming Number is routed to a specific individual user, the system will attempt to use that Incoming Number as the user's caller ID when they make outgoing calls if no other number is specified. This requires that the Incoming Number is a full number suitable for user as outgoing caller ID and acceptable to the line provider.

When this is the case, the character i can also be added to the Incoming Number field. This character does not affect the incoming call routing. However when the same Incoming Number is used for an outgoing caller ID, the calling party number plan is set to ISDN and the type is set to National. This option may be required by some network providers.

For internal calls being forwarded or twinned, if multiple incoming call route entries match the extension number used as caller ID, the first entry created is used. This entry should start with a "-" character (meaning fixed length) and provide the full national number. These entries do not support wildcards. If additional entries are required for incoming call routing, they should be created after the entry required for reverse lookup.

## Incoming Call Route Voice Recording

Navigation: **System Settings > Incoming Call Route > Add/Edit Incoming Call Route**

These settings are used to activate the automatic recording of incoming calls that match the incoming call route.

- Call recording requires Voicemail Pro to be installed and running. Call recording also requires available conference resources similar to a 3-way conference.

- Call recording starts when the call is answered.
- Call recording is paused when the call is parked or held. It restarts when the call is unparked or taken off hold. This does not apply to SIP terminals.
- Calls to and from IP devices, including those using Direct media, can be recorded.
- Recording continues for the duration of the call or up to the maximum recording time configured on the voicemail server.
- Recording is stopped when the call ends or if:
  - User call recording stops if the call is transferred to another user.
  - Account code call recording stops if the call is transferred to another user.
  - Hunt group call recording stops if the call is transferred to another user who is not a member of the hunt group.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Record Inbound</b>      | Default = None<br>Select whether automatic recording of incoming calls is enabled. The options are: <ul style="list-style-type: none"> <li>• <b>None:</b> Do not automatically record calls.</li> <li>• <b>On:</b> Record the call if possible. Otherwise, allow the call to continue without recording.</li> <li>• <b>Mandatory:</b> Record the call if possible. Otherwise, block the call and return busy tone.</li> <li>• <b>Percentages of calls:</b> Record a selected percentages of the calls.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Record Time Profile</b> | Default = <None> (Any time)<br>Used to select a time profile during which automatic call recording of incoming calls is applied. If no profile is selected, automatic recording is always active.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Recording (Auto)</b>    | Default = Mailbox<br>Sets the destination for automatically triggered recordings. The options are: <ul style="list-style-type: none"> <li>• <b>Mailbox</b> This option sets the destination for the recording to be a selected user or hunt group mailbox. The adjacent drop down list is used to select the mailbox.</li> <li>• <b>Voice Recording Library:</b> This option set the destination for the recording to be a VRL folder on the voicemail server. The VRL application polls that folder and collects waiting recordings which it then places in its archive. Recording is still done by Voicemail Pro.</li> <li>• <b>Voice Recording Library Authenticated:</b> This option is similar to the above but instructs the voicemail server to create an authenticated recording. If the file contents are changed, the file is invalidated though it can still be played.               <ul style="list-style-type: none"> <li>- For systems recording to .opus format (the default), both settings create authenticated recordings.</li> </ul> </li> </ul> |

## Incoming Call Route Destinations

Navigation: **System Settings > Incoming Call Route > Add/Edit Incoming Call Route**

The system allows you to associate multiple time profiles with an incoming call route. For each time profile, you can specify separate Destination and Fallback Extension settings.

When you add multiple records, the IP Office looks for the first time profile match starting from the bottom up. If the IP Office does not find a match, it uses the Default Value destinations. Once the IP Office makes a match, it does not use any other destinations.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

- For a Server Edition network, these settings can be configured at the network level and are then automatically replicated in the configuration of all systems in the network. They can only be seen and edited at the individual system configuration level if record consolidation is switched off.

| Field               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Time Profile</b> | <p>This column is used to specify the time profiles used by the incoming call route. The drop-down list display existing time profiles from you can make a selection. To remove an existing entry, select it by clicking on the button on the left of the row, then right-click on the row and select <b>Delete</b>.</p> <ul style="list-style-type: none"> <li>• The <b>Default Value</b> entry is used if no match to a time profile occurs.</li> </ul> |

*Table continues...*

| Field                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Destination</b>        | <p>Default = Blank</p> <p>Either enter the destination manually or select the destination from the drop-down list.</p> <p>The following options appear in the drop-down list:</p> <ul style="list-style-type: none"> <li>• <b>Voicemail</b> allows remote mailbox access with voicemail. Callers are asked to enter the extension ID of the mailbox required and then the mailbox access code.</li> <li>• Local user names.</li> <li>• Local hunt groups names.</li> <li>• <b>AA: Name</b> directs calls to an Embedded Voicemail auto-attendant services.</li> </ul> <p>In addition to short codes, extension and external numbers, you can manually enter the following options:</p> <ul style="list-style-type: none"> <li>• <b>VM:Name</b> Directs calls to the matching start point in Voicemail Pro.</li> <li>• A . matches the Incoming Number field. This can be used even when X wildcards are being used in the Incoming Number field.</li> <li>• A # matches all X wildcards in the <b>Incoming Number</b> field. For example, if the Incoming Number was -91XXXXXXXXXX, the <b>Destination</b> of # would match XXXXXXXXXXXX.</li> <li>• Text and number strings entered here are passed through to system short codes, for example to direct calls into a conference. Note that not all short code features are supported.</li> <li>• You must use quote marks where necessary to stop characters in the destination string being interpreted as special characters.</li> </ul> |
| <b>Fallback Extension</b> | <p>Default = Blank (No fallback)</p> <p>Defines an alternate destination which the IP Office should use when the <b>Destination</b> cannot accept new calls and has no coverage settings to redirect calls. For example:</p> <ul style="list-style-type: none"> <li>• For an extension as the destination:, use the fallback if: <ul style="list-style-type: none"> <li>- The target extension has no more call appearance buttons available and does not have voicemail on.</li> <li>- The target extension is logged out.</li> <li>- The target extension is set to 'do not disturb' and does not have voicemail on.</li> <li>- The target extension has been unplugged and has no voicemail. <ul style="list-style-type: none"> <li>• Not supported for analog extensions.</li> </ul> </li> <li>• For IP extensions, there is a 3-minute delay before the extension is unregistered from the IP Office during which the IP Office still attempts to present new calls to the extension.</li> </ul> </li> <li>• For a hunt group as the destination:, use the fallback if: <ul style="list-style-type: none"> <li>- The hunt group members are all busy and the group does not have queuing and voicemail enabled.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                  |

## Incoming Call Route MSN Configuration

Navigation: **System Settings > Incoming Call Route > MSN Configuration**

Used to populate the **Incoming Call Route** table with a range of MSN or DID numbers.

| Setting                    | Description                                                                                                                                                                                                                                                                                                                       |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MSN/DID</b>             | The first number in the set of MSN numbers for which you have subscribed.<br><br> <b>Note:</b><br>If you require to find an exact match between the MSN numbers and the destination numbers, enter a minus (-) sign before the first MSN number. |
| <b>Destination</b>         | Where incoming calls with matching digits should be routed. The drop-down list contains the extensions and groups on the system.                                                                                                                                                                                                  |
| <b>Line Group ID</b>       | Specifies the incoming line group ID of the trunks to which the DID routing is applied.                                                                                                                                                                                                                                           |
| <b>Presentation Digits</b> | Set to match the number of digits from the MSN/DID number that the central office exchange will actually present to the system.                                                                                                                                                                                                   |
| <b>Range</b>               | How many MSN or DID number routes to create in sequence using the selected MSN/DID and Destination as start points. Only routing to user extensions is supported when creating a range of records.                                                                                                                                |

# Chapter 25: IP Route

## System Settings > IP Route

This menu is used to configure static IP routes to control the routing of matching IP addresses and address ranges.

For additional configuration information, see [Configuring IP Routes](#) on page 748.

### Main content pane

The **IP Route** main content pane lists provisioned IP routes. The contents of the list depends on the filter options selected. Click the icons beside a route to edit or delete.

**Bulk delete:** You can delete multiple records. Select the check box to the right of each record you want to delete and click **Delete**. You receive a prompt to confirm the deletion.

Click **Add/Edit IP Route** to open the Add IP Route window where you can provision a location. When you click **Add/Edit IP Route**, you are prompted to specify a server.

## Add IP Route

Navigation: **System Settings > IP Route > Add/Edit IP Route**

### Additional configuration information

For additional configuration information, see [Configuring IP Routes](#) on page 748.

This type of configuration record can be saved as a template and new records created from a template. See [Working with Templates](#) on page 810.

### Configuration settings

You can use these settings to setup static IPv4 routes for the IP Office system. The IP Office supports up to 100 static, dynamic, and internal routes.

#### **Warning:**

- The 'on-boarding' process (see the *Deploying Avaya IP Office™ Platform SSL VPN Services* manual) can automatically add a static route to an SSL VPN service when the on-boarding file is uploaded to the IP Office system. Do not delete or amend that route except when advised to by Avaya.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Field                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IP Address</b>         | <p>The IP address to match for ongoing routing. The IP Office routes any packets matching the <b>IP Address</b> and <b>IP Mask</b> settings to the configured <b>Destination</b>.</p> <ul style="list-style-type: none"> <li>When left blank, the address 255.255.255.255 (all) is used.</li> </ul>                                                                                                                                                             |
| <b>IP Mask</b>            | <p>The subnet mask used to mask the <b>IP Address</b> for ongoing route matching.</p> <ul style="list-style-type: none"> <li>If blank, the mask used is 255.255.255.255 (all).</li> <li>A <b>0.0.0.0</b> entry in the <b>IP Address</b> and <b>IP Mask</b> fields routes all packets for which there is no other specific <b>IP Route</b> available. The Default Route option with Services can be used to do this if a blank IP route is not added.</li> </ul> |
| <b>Gateway IP Address</b> | <p>Default = Blank</p> <p>The address of the gateway to which the IP Office sends packets that match the route.</p> <ul style="list-style-type: none"> <li>If left blank or set to <b>0.0.0.0</b>, then all packets are sent to the <b>Destination</b> specified. This is normally only used to forward packets to another router on the local LAN.</li> </ul>                                                                                                  |
| <b>Destination</b>        | Select <b>LAN1</b> , <b>LAN2</b> , any configured <b>Service</b> , or any <b>Tunnel (L2TP only)</b> .                                                                                                                                                                                                                                                                                                                                                           |
| <b>Metric:</b>            | <p>Default = 0</p> <p>The number of "hops" this route counts as.</p>                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Proxy ARP</b>          | <p>Default = Off</p> <p>This allows the IP Office system to respond on behalf of this IP address when receiving an ARP request.</p>                                                                                                                                                                                                                                                                                                                             |

# Chapter 26: Licenses

## System Settings > Licenses

This menu is used to configure the license source settings on non-subscription systems.

### **Note:**

This section is not applicable to systems running in subscription mode.

For additional configuration information, see the following.

- [Applying Licenses](#) on page 794.
- [Converting from Nodal Licensing to Centralized Licensing](#) on page 807
- [Migrating ADI Licenses to PLDS](#) on page 808
- “Licenses” in *Avaya IP Office™ Platform Solution Description*.

## Main content pane

Clicking **System Settings > Licenses** opens the Systems page with a list of all IP Office systems. Click on the three bar menu icon to the right of a system to view the licensing information for that system.

## License

Navigation: **System Settings > Licenses > Server Menu > Manage Licenses**

These settings can be edited online. Changes to these settings do not require a reboot of the system.

| Name             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                     |                  |                                            |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|------------------|--------------------------------------------|
| License Mode     | Identifies the status of the system licenses. The two license configuration types are nodal and WebLM. Nodal licenses are licenses that are present on the system. WebLM licenses means licenses obtained from the WebLM server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                     |                  |                                            |
|                  | The possible states are:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                     |                  |                                            |
|                  | <ul style="list-style-type: none"><li>• <b>Normal Mode</b> Normal nodal licensing mode. In this mode, WebLM is not configured and only nodal licensing is allowed.</li><li>• <b>Server Error</b> This mode occurs when transitioning to WebLM licensing. WebLM has been configured but the server is not available.</li><li>• <b>Configuration Error</b> This mode occurs when transitioning to WebLM licensing. WebLM has been configured and the server is available, but there are not enough licenses available to license all of the configured features. Only nodal licenses are valid on Standard mode IP500 V2 systems.</li><li>• <b>WebLM Normal Mode</b> The system is fully licensed. WebLM has been configured and there are enough licenses available to license all of the configured features.</li><li>• <b>WebLM Error Mode</b> Action is required to correct the License Mode. Refer to the License Status column and the Error List section at the bottom of the screen to determine why the system is in License Error Mode. A 30-day grace period provides access to the capacities and features of the installed license when the system is in License Error Mode.</li><li>• <b>WebLM Restricted Mode</b> When the system is in License Error Mode, if the problem is not resolved with the 30-day grace period, the system will enter License Restricted Mode. When in this mode, configuration changes are blocked, except for fixing the licensing errors. If a feature license cannot be acquired from the WebLM server, the feature will not function.</li></ul> |                     |                  |                                            |

| <b>Key</b>         | <p>This is the license key string supplied. It is a unique value based on the feature being licensed and the either the system's <b>Dongle Serial Number</b> or <b>System Identification</b> depending on the type of system.</p> <p>Not applicable when using PLDS or WebLM licensing. This field is not displayed if there are no ADI licenses.</p>                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Instance</b>    | For information only. Some licenses enable a number of port, channels or users. When that is the case, the number of such is indicated here. Multiple licenses for the same feature are usually cumulative.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Status</b>      | <p>For information only. This field indicates the current validation status of the license key.</p> <ul style="list-style-type: none"> <li>• <b>Unknown</b> This status is shown for licenses that have just been added to the configuration shown in Manager. Once the configuration has been sent back to the system and then reloaded, the status will change to one of those below.</li> <li>• <b>Valid</b>: The license is valid.</li> <li>• <b>Invalid</b>: The license was not recognized. It did not match the PLDS host ID.</li> <li>• <b>Dormant</b>: The license is valid but is conditional on some other pre-requisite licenses.</li> <li>• <b>Obsolete</b>: The license is valid but is one no longer used by the level of software running on the system.</li> </ul> |
| <b>Expiry Date</b> | For information only. Trial licenses can be set to expire within a set period from their issue. The expiry date is shown here.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Source</b>      | <p>The source of the license file. The options are:</p> <ul style="list-style-type: none"> <li>• <b>ADI Nodal</b>: ADI licenses added locally to the system. This may appear on upgraded systems.</li> <li>• <b>PLDS Nodal</b>: PLDS licenses added locally to the system.</li> <li>• <b>WebLM</b>: Licenses obtained from the WebLM server.</li> <li>• <b>Virtual</b>: Licenses created by the system. This may appear on upgraded systems.</li> <li>• <b>Virtual Grace</b>: Licenses created by the system while in WebLM error mode.</li> </ul>                                                                                                                                                                                                                                  |

### Additional Configuration Information

Click **PLDS License > Send To IP Office > OK** to open the **Select PLDS License File** dialog from where you can upload a PLDS license to IP Office. You can browse to a location on your system and select a file to upload.

Select an existing license and click **PLDS License > Delete From IP Office > OK** to delete the selected license.

## Remote Server

Navigation: **System Settings > Licenses > Server Menu > Remote Server**

This tab is used for:

- For licensing of IP500 V2 systems in Enterprise Branch deployments.
- To specify the method of centralized licensing used for PLDS licensed IP Office Server Edition and Select systems

### Offline Editing

The **Reserved Licenses** setting can be edited online. The remaining settings must be edited offline. Changes to these settings require a reboot of the system.

To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

The following fields control which source the IP Office system uses for its licenses. The fields shown depends on the type of IP Office system:

| Field                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Licence Source</b>       | <p>Default = WebLM.</p> <p>This field is available on Server Edition systems. All IP Office systems in the network must use the same source for licensing. The options are:</p> <ul style="list-style-type: none"> <li>• <b>WebLM</b><br/>Use licenses obtained from the PLDS license file uploaded to the WebLM service. All IP Office servers in the network request license reservations from the WebLM service. <ul style="list-style-type: none"> <li>- On Server Edition systems, a <b>Deploy</b> button appears when you select <b>WebLM</b> as <b>License Source</b>. Click the <b>Deploy</b> button to browse and select a license file to deploy.</li> </ul> </li> <li>• <b>Local / Primary Server</b><br/>PLDS license files are uploaded to the IP Office service of each IP Office server. Depending on the particular licenses: <ul style="list-style-type: none"> <li>- Some licenses are obtained by reservation requests to the primary IP Office server</li> <li>- Others licenses are obtained from the IP Office server's own license file.</li> </ul> </li> </ul> |
| <b>Enable Remote Server</b> | <p>Default = Off.</p> <p>This field is available on non-Server Edition IP500 V2 systems. The options are:</p> <ul style="list-style-type: none"> <li>• If disabled, the IP Office system is licensed locally by uploading a license file to the system.</li> <li>• If enabled, the system uses licenses requested from a remote WebLM server. This option is only supported for systems in a branch enterprise supported via Avaya Aura<sup>®</sup> System Manager.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

The additional fields displayed depend on the license source selection above:

## Local/Primary Server Licensed Server Settings

| Field                            | Description                                                                                                                                                                                                                                                                                     |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>License Server IP Address</b> | <p>Default = 127.0.0.1 on Primary. On Secondary and expansion systems, the default is the Primary IP address.</p> <p>This field is available when the <b>Licence Source</b> is set to <b>Local Primary Server</b>. This field contains the IP address of the Server Edition Primary server.</p> |

## WebLM Licensed Primary Server Settings

| Field                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Domain Name (URL)</b> | <p>Default = Blank for IP500 V2 systems and for Server Edition Primary hosted deployments. For Server Edition, the IP address of the Primary Server.</p> <ul style="list-style-type: none"> <li>For Enterprise Branch deployments, the domain name or IP address of the WebLM server or the domain name of System Manager if the system is under System Manager control.</li> <li>For Server Edition deployments, the domain name or IP address of the Primary Server.</li> <li>For Server Edition hosted deployments, the domain name of the WebLM server.</li> </ul> <p>The format can be the FQDN or the IP address prefixed with https://.</p> |
| <b>Path</b>              | <p>Default = WebLM/LicenseServer.</p> <p>The path on the web server of the WebLM resource.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Port Number</b>       | <p>Default = 52233.</p> <p>The port number of the WebLM server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>WebLM Client ID</b>   | <p>Default = An ID based on MAC address and hostname of the system.</p> <p>This field is editable but must only be changed on Avaya Partner Hosted systems.</p> <p> <b>Important:</b></p> <ul style="list-style-type: none"> <li>For all other deployment scenarios, you must ensure the value matches the <b>WebLM Node ID</b> below. Changing the value will cause license issues for users and phones, including non-IP phones.</li> </ul>                                                                                                                   |
| <b>WebLM Node ID</b>     | <p>Default = An ID based on MAC address and hostname of the system. Read-only.</p> <p>Used by the WebLM service to identify the IP Office system requesting licenses.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### WebLM Licensed Server (non-Primary) Settings

| Field                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Primary IP Address</b>                      | <p>Default = The IP address of the Server Edition Primary server.</p> <p>Available on Server Edition Secondary and Expansion systems when <b>Enable proxy via Primary IP Office line</b> is enabled</p>                                                                                                                                                                                                                                                                                                         |
| <b>WebLM Client ID</b>                         | Default = An ID based on MAC address and hostname of the system. Read-only.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>WebLM Node ID</b>                           | Used by the WebLM service to identify the IP Office system requesting licenses.                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### Reserved Licenses

These fields are used to reserve licenses from the license server, WebLM or, if using nodal licensing, the Primary server. There are two types of reservation field; manual and automatic.

- Manual fields can be used to set the number of licenses that the server should request from those available on the primary/WebLM server.
- Automatic fields are set to match other aspects of the server configuration, for example the number of configured power users. Note that these values may not change until after the configuration is saved and then reloaded.

# Chapter 27: Line

## System Settings > Line

Lines are used for external calls, both incoming and outgoing.

Click **Add/Edit Trunk Line** to select a line type to add and to specify the system where the line will be added.

## Add Trunk Line

Navigation: **System Settings > Line > Add/Edit Trunk Line**

The line settings shown in the system configuration will change according to the types of trunk cards installed in the control unit or added using external expansion modules.

### **Warning:**

**Changing Trunk Cards** - Changing the trunk card installed in a control unit will result in line settings for both the previous trunk card and the installed trunk card. To change the type of

trunk card installed in a particular card slot, the configuration must be defaulted. This does not apply if replacing an existing card with one of a higher capacity or fitting a trunk card into an unused slot.

## Trunk Incoming Call Routing

Trunks are categorized as external or trunk. The trunk type affects how the system routes calls received on that trunk and the routing of calls to the trunk.

| Trunk Types                                                                                                                                                                                                                       | Incoming Calls Routed by                                                                                                                                                                                                                                                                                                                                   |

## Line Groups

Each system trunk (or in some cases individual trunk channels) can be configured with an **Incoming Group ID** and an **Outgoing Group ID**. These group IDs are used as follows:

- **Incoming Call Routes** - For incoming calls on external trunks, the Incoming Group ID of the trunk is one of the factors used to match the call to one of the configured incoming call routes.
- **Short Codes** - For dialing which matches a short code set to a **Dial** feature, the short codes **Line Group ID** can indicate either an ARS form or to use a trunk from set to the same **Outgoing Group ID**. If the call is routed to an ARS form, the short codes in the ARS form will specify the trunks to use by matching **Outgoing Group ID**.

## Removing Unused Trunks

In cases where a trunk card is installed but the trunk is not physically connected, it is important to ensure that the trunk is disabled in the configuration. This can be done on most trunks using by setting the line's **Admin** setting to **Out of Service**.

This is especially important with analog trunks. Failure to do this may cause the system to attempt to present outgoing calls to that trunk. Similarly, where the number of channels subscribed is less than those supportable by the trunk type, the unsubscribed channels should be disabled.

### Clock Quality

Calls between systems using digital trunks (for example E1, E1R2, T1 PRI and BRI) require an common clock signal. The system will try to obtain this clock signal from a PSTN exchange through one of its digital trunks. This is done by setting the **Clock Quality** setting of that line to **Network**. If there are multiple trunks to public exchanges, another trunk can be set as **Fallback** should the primary clock signal fail. Other trunks should be set as **Unsuitable**.

## ACO Line | ACO

Navigation: **System Settings > Line > Add/Edit Trunk Line > ACO Line > ACO**

### Configuration Settings

These settings are mergeable with the exception of the **Line Number** setting. Changing the **Line Number** setting requires a “merge with service disruption”. When the configuration file is sent to the system, the SIP trunk is restarted and all calls on the line are dropped.

Offline editing is not required.

| Field                  | Description                                                                                                                                                                                                   |

## ACO Line | T38 FAX

Navigation: **System Settings > Line > Add/Edit Trunk Line > ACO Line > T38 FAX**

The settings are available only on IP500 V2 since it can terminate T38 fax. On the **VoIP** settings for the line type, **Fax Transport Support** must be set to **T38** or **T38 Fallback**.

These settings are mergeable.

## Analog Line

Navigation: **System Settings > Line > Add/Edit Trunk Line > Analog Line**

Analog trunks can be provided within the systems in the following ways. In all cases the physical ports are labeled as Analog. For full details of installation refer to the IP Office Installation manual.

**Using ICLID:** The system can route incoming calls using the ICLID received with the call. However ICLID is not sent instantaneously. On analog trunks set to Loop Start ICLID, there will be a short delay while the system waits for any ICLID digits before it can determine where to present the call.

**Line Status:** Analog line do not indicate call status other than whether the line is free or in use. Some system features, for example retrieving unanswered forwards and making twinned calls make use of the call status indicated by digital lines. This is not possible with analog lines. Once an analog line has been seized, the system has to assume that the call is connected and treats it as having been answered.

**Dialing Complete:** The majority of North-American telephony services use en-bloc dialing. Therefore the use of a ; is recommended at the end of all dialing short codes that use an N. This is also recommended for all dialing where secondary dial tone short codes are being used.

**Ground Start:** This type of analog trunk is only supported through the Analog Trunk external expansion module.

## Line Settings

Navigation: **System Settings > Line > Add/Edit Trunk Line > Analog Line > Line Settings**

### Configuration Settings

These settings are mergeable with the exception of the **Network Type** setting. Changes to this setting will require a reboot of the system.

| Field              | Description                                                                                                                                                                                                                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Line Number</b> | This parameter is not configurable, it is allocated by the system.                                                                                                                                                                                                                                                          |
| <b>Card/Module</b> | Indicates the card slot or expansion module being used for the trunk device providing the line. For IP500 V2 control units: 1 to 4 match the slots on the front of the control unit from left to right. Expansion modules are numbered from 5 upwards, for example trunks on the module in Expansion Port 1 are shown as 5. |
| <b>Port</b>        | Indicates the port on the Card/Module above to which the configuration settings relate.                                                                                                                                                                                                                                     |

|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Line Appearance ID</b> | Default = Auto-assigned. Range = 2 to 9 digits. Allows a number to be assigned to the line to identify it. On phones that support call appearance buttons, a Line Appearance button with the same number will show the status of the line and can be used to answer calls on the line. The line appearance ID must be unique and not match any extension number. |
| <b>Admin</b>              | Default = In Service.<br><br>This field allows a trunk to be taken out of service if required for maintenance or if the trunk is not connected.                                                                                                                                                                                                                  |

## Line Options

Navigation: **System Settings > Line > Add/Edit Trunk Line > Analog Line > Analog Options**

Covers analog line specific settings. The system wide setting **System Settings > System > Telephony > Tones and Music > CLI Type** is used for to set the incoming CLI detection method for all analogue trunks.

These settings must be edited offline. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

| Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Await Dial Tone</b>           | Default = 0. Range = 0 to 25500ms.<br>Sets how long the system should wait before dialing out.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Echo Cancellation</b>         | Default = 16ms.<br><br>The echo cancellation should only be adjusted as high as required to remove echo problems. Setting it to a higher value than necessary can cause other distortions. Not used with external expansion module trunks. The options are (milliseconds): <b>Off, 8, 16, 32, 64, 128.</b>                                                                                                                                                                                                                                |
| <b>Echo Reduction</b>            | Default = On. (ATM4Uv2 card only)<br><br>Used when impedance matching is not required but echo reduction is.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Mains Hum Filter</b>          | Default = Off.<br><br>If mains hum interference on the lines is detected or suspected, this settings can be used to attempt to remove that interference. Useable with ATM16 trunks and IP500 ATM4U trunks. The options are: <b>Off, 50Hz, 60Hz.</b>                                                                                                                                                                                                                                                                                       |
| <b>Impedance</b>                 | Set the impedance used for the line. This field is only available for system locales where the default value can be changed.<br><br>The value used for <b>Default</b> is set by the setting <b>System Settings &gt; System &gt; System &gt; Locale</b> . For information, see <i>Avaya IP Office Locale Settings</i> .<br><br>The following values are used for <b>Automatic Impedance Matching</b> : 600+2150nF, 600, 900+2150nF, 900, 220+820  115nF, 370+620  310nF, 270+750  150nF, 320+1050  230nF, 350+1000  210nF, 800+100  210nF. |
| <b>Quiet Line</b>                | This field is only available for certain system locales (see above). The setting may be required to compensate for signal loss on long lines.                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Digits to break dial tone</b> | Default = 2. Range = Up to 3 digits.<br><br>During automatic impedance testing (see below), once the system has seized a line, it dials this digit or digits to the line. In some cases it may be necessary to use a different digit or digits. For example, if analog trunk go via another PBX system or Centrex, it will be necessary to use the external trunk dialing prefix of the remote system plus another digit, for example 92.                                                                                                 |

| <b>Automatic Balance Impedance Match</b>   | <p>These controls can be used to test the impedance of a line and to then display the best match resulting from the test. Testing should be performed with the line connected but the system otherwise idle. To start testing click <b>Start</b>. The system will then send a series of signals to the line and monitor the response, repeating this at each possible impedance setting. Testing can be stopped at any time by clicking <b>Stop</b>. When testing is complete, Manager will display the best match and ask whether that match should be used for the line. If <b>Yes</b> is selected, Manager will also ask whether the match should be applied to all other analog lines provided by the same analog trunk card or module.</p> <p>Note that on the Analog Trunk Module (ATM16), there are four control devices, each supporting four channels. The impedance is set by the control device for all four channels under its control. Consequently, the impedance match tool only functions on lines 1, 5, 9, and 13.</p> <p>Before testing, ensure that the following system settings are correctly set:</p> <ul style="list-style-type: none"> <li>• <b>System Settings &gt; System &gt; System &gt; Locale</b></li> <li>• <b>System Settings &gt; System &gt; Telephony &gt; Companding Law</b></li> </ul> <p>If either needs to be changed, make the required change and save the setting to the system before proceeding with impedance matching.</p> <p>Due to hardware differences, the impedance matching result will vary slightly depending on which type of trunk card or expansion module is being used.</p> <p><b>Automatic Balance Impedance Matching, Quiet Line and Digits to break dial tone</b> are available for the Bahrain, Egypt, French Canadian, India, Kuwait, Morocco, Oman, Pakistan, Qatar, Saudi Arabia, South Africa, Turkey, United Arab Emirates, United States and Customize locales.</p> |
| <b>Allow Analog Trunk to Trunk Connect</b> | <p>Default = Not selected (Off). When not enabled, users cannot transfer or forward external calls back off-switch using an analog trunk if the call was originally made or received on another analog trunk. This prevents transfers to trunks that do not support disconnect clear.</p> <p>If the setting <b>System Settings &gt; System &gt; Telephony &gt; Unsupervised Analog Trunk Disconnect Handling</b> is enabled, this setting is greyed out and trunk to trunk connections to any analog trunks are not allowed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>BCC</b>                                 | <p>Default = Not selected [Brazil locale only]</p> <p>A collect call is a call at the receiver's expense and by his permission. If supported by the line provider, BCC (Block Collect Call) can be used to bar collect calls.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Long CLI Line</b>                       | <p>Default = Off</p> <p>The CLI signal on some analog lines can become degraded and is not then correctly detected. If you are sure that CLI is being provided but not detected, selecting this option may resolve the problem.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Field                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Modem Enabled</b>         | <p>Default = Off</p> <p>The first analog trunk in a control unit can be set to modem operation (V32 with V42 error correction). This allows the trunk to answer incoming modem calls and be used for system maintenance. When on, the trunk can only be used for analog modem calls. The default system short code *9000* can be used to toggle this setting.</p> <p>For the IP500 ATM4U-V2 Trunk Card Modem, it is not required to switch the card's modem port on/off. The trunk card's V32 modem function can be accessed simply by routing a modem call to the RAS service's extension number. The modem call does not have to use the first analog trunk, instead the port remains available for voice calls.</p> |
| <b>MWI Standard</b>          | <p>Default = None.</p> <p>This setting is only displayed for ATM4U-V2 cards. When <b>System Settings &gt; System &gt; Voicemail</b> is set to <b>Analogue MWI</b>, change this setting to <b>Bellcore FSK</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>BCC Flash Pulse Width</b> | <p>Default = 100 (1000ms). Range = 0 to 255.</p> <p>Brazil locale only. Sets the BCC (Block collect call) flash pulse width.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Pulse Dialing

These settings are used for pulse dialing.

| Field                    | Description                                                                                                                   |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>Mark</b>              | <p>Default = 40ms. Range = 0 to 255.</p> <p>Interval when DTMF signal is kept active during transmission of DTMF signals.</p> |
| <b>Space</b>             | <p>Default = 60ms. Range = 0 to 255.</p> <p>Interval of silence between DTMF signal transmissions.</p>                        |
| <b>Inter-Digit Pause</b> | <p>Default = 500ms. Range = 0 to 2550ms.</p> <p>Sets the pause between digits transmitted to the line.</p>                    |

## Ring Detection

These settings are used for ring detection.

| Field                   | Description                                                                                                                            |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ring Persistency</b> | <p>Default = Set according to system locale. Range = 0 to 2550ms.</p> <p>The minimum duration of signal required to be recognized.</p> |
| <b>Ring Off Maximum</b> | <p>Default = Set according to system locale. Range = 0 to 25500ms.</p> <p>The time required before signaling is regarded as ended.</p> |

## Disconnect Clear

Disconnect clear (also known as 'Line Break' or 'Reliable Disconnect') is a method used to signal from the line provider that the call has cleared. The system also uses 'Tone Disconnect', which

clears an analog call after 6 seconds of continuous tone, configured through the Busy Tone Detection (**System | Telephony | Tones & Music**) settings.

| Field                   | Description                                                                                                                                                                                                                                               |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Disconnect Clear</b> | Default = On<br><br>Enables the use of disconnect clear.<br><br>If the setting <b>System Settings &gt; System &gt; Telephony &gt; Unsupervised Analog Trunk Disconnect Handling</b> is enabled, this setting is greyed out and disconnect clear disabled. |
| <b>Units</b>            | Default = 500ms. Range = 0 to 2550ms.<br><br>This time must be less than the actual disconnect time period used by the line provider by at least 150ms.                                                                                                   |

## Secondary Dial Tone

Configures the use of secondary dial tone on analog lines. This is a different mechanism from secondary dial tone using short codes. This method is used mainly within the Russian locale. When selected, the options are:

| Field                      | Description                                                                                                                          |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Secondary Dial Tone</b> | Default = Off                                                                                                                        |
| <b>Await time:</b>         | Default = 3000ms. Range = 0 to 25500ms.<br><br>Used when secondary dial tone (above) is selected. Sets the delay.                    |
| <b>After n Digits</b>      | Default = 1. Range = 0 to 10.<br><br>Sets where in the dialing string, the delay for secondary dial tone, should occur.              |
| <b>Matching Digit</b>      | Default = 8. Range = 0 to 9.<br><br>The digit which, when first matched in the dialing string, will cause secondary dial tone delay. |

## DTMF

These settings are used for DTMF dialing.

| Field      | Description                                                                                           |
|------------|-------------------------------------------------------------------------------------------------------|
| <b>On</b>  | Default = 80ms. Range = 0 to 255ms.<br><br>The width of the on pulses generated during DTMF dialing.  |
| <b>Off</b> | Default = 80ms. Range = 0 to 255ms.<br><br>The width of the off pulses generated during DTMF dialing. |

## Gains

These settings are used to adjust the perceived volume on all calls.

| Field                  | Description                                                                                                                                                                                                                                                                                                                       |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>A   D</b>           | Default = 0dB. Range = -10.0dB to +6.0dB in 0.5dB steps.<br><br>Sets the analog to digital gain applied to the signal received from the trunk by the system. To conform with the Receive Objective Loudness Rating at distances greater than 2.7km from the central office, on analog trunks a receive gain of 1.5dB must be set. |
| <b>D   A</b>           | Default = 0dB. Range = -10.0dB to +6.0dB in 0.5dB steps.<br><br>Sets the digital to analog gain applied to the signal from the system to the trunk.                                                                                                                                                                               |
| <b>Voice Recording</b> | Default = Low<br><br>Used to adjust the volume level of calls recorded by voicemail. The options are <b>Low</b> , <b>Medium</b> or <b>High</b> .                                                                                                                                                                                  |

## BRI Line

Navigation: **System Settings > Line > Add/Edit Trunk Line > BRI Line**

BRI trunks are provided by the installation of a BRI trunk card into the control unit. The cards are available in different variants with either 2 or 4 physical ports. Each port supports 2 B-channels for calls. For full details of installation refer to the IP Office Installation manual.

### Point-to-Point or Multipoint

BRI lines can be used in either Point-to-Point or Point-to-Multipoint mode. Point-to-Point lines are used when only one device terminates a line in a customer's office. Point-to-Multipoint lines are used when more than one device may be used on the line at the customer's premises. There are major benefits in using Point-to-Point lines:-

- The exchange knows when the line/terminal equipment is down/dead, thus it will not offer calls down that line. If the lines are Point-to-Multipoint, calls are always offered down the line and fail if there is no response from the terminal equipment. So if you have two Point-to-Multipoint lines and one is faulty 50% of incoming calls fail.
- You get a green LED on the Control Unit when the line is connected. With Point-to-Multipoint lines some exchanges will drop layer 1/2 signals when the line is idle for a period.
- The timing clock is locked to the exchange. If layer 1/2 signals disappear on a line then the Control Unit will switch to another line, however this may result in some audible click when the switchover occurs.

The system's default Terminal Equipment Identifier (TEI) will normally allow it to work on Point-to-Point or Point-to-Multipoint lines. However if you intend to connect multiple devices simultaneously to an BRI line, then the TEI should be set to 127. With a TEI of 127, the control unit will ask the exchange to allocate a TEI for operation.

 **Note:**

When connected to some manufactures equipment, which provides an S0 interface (BRI), a defaulted Control Unit will not bring up the ISDN line. Configuring the Control Unit to a TEI of 127 for that line will usually resolve this.

## Line Settings

Navigation: **System Settings > Line > Add/Edit Trunk Line > BRI Line > Line Settings**

The following settings must be edited offline. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

- **Line Sub Type, Network Type, TEI, Add 'Not-end-to-end ISDN' Information Element, Progress Replacement, Clock Quality, Force Number Plan to ISDN, Number of Channels.**

The remaining settings can be edited online.

| Field                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>National Prefix</b>      | <p>Default = 0</p> <p>This indicates the digits to be prefixed to a incoming national call. When a number is presented from ISDN as a "national number" this prefix is added. For example 1923000000 is converted to 01923000000.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>International Prefix</b> | <p>Default = 00</p> <p>This indicates the digits to be prefixed to an incoming international call. When a number is presented from ISDN as an "international number" this prefix is added. For example 441923000000 is converted to 00441923000000.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>TEI</b>                  | <p>Default = 0 The Terminal Equipment Identifier. Used to identify each device connected to a particular ISDN line. For Point-to-Point lines this is 0. It can also be 0 on a Point to Multipoint line, however if multiple devices are sharing a Point-to-Multipoint line it should be set to 127 which results in the exchange allocating the TEI's to be used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Number of Channels</b>   | <p>Default = 2. Range = 0 to 2.</p> <p>Defines the number of operational channels that are available on this line.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Outgoing Channels</b>    | <p>Default = 2. Range = 0 to 2.</p> <p>This defines the number of channels available, on this line, for outgoing calls. This should normally be the same as Number of Channels field, but can be reduced to ensure incoming calls cannot be blocked by outgoing calls.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Voice Channels</b>       | <p>Default = 2. Range = 0 to 2.</p> <p>The number of channels available for voice use.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Data Channels</b>        | <p>Default = 2. Range = 0 to 2.</p> <p>The number of channels available for data use. If left blank, the value is 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Clock Quality</b>        | <p>Default = Network</p> <p>Refer to the IP Office Installation Manual for full details. This option sets whether the system should try to take its clock source for call synchronization and signalling from this line. Preference should always be given to using the clock source from a central office exchange if available by setting at least one exchange line to <b>Network</b>.</p> <ul style="list-style-type: none"> <li>• If multiple lines are set as <b>Network</b>, the order in which those lines are used is described in the IP Office Installation Manual. If additional lines are available, <b>Fallback</b> can be used to specify a clock source to use should the <b>Network</b> source not be available.</li> <li>• Lines from which the clock source should not be taken should be set as <b>Unsuitable</b>.</li> <li>• If no clock source is available, the system uses its own internal 8KHz clock source.</li> <li>• In scenarios where several systems are network via digital trunk lines, care must be taken to ensure that all the systems use the same clock source. The current source being used by a system is reported within the System Status Application.</li> </ul> |

| Field                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Add 'Not-end-to-end ISDN' Information Element</b> | Default = Never*. Sets whether the optional 'Not end-to-end ISDN' information element should be added to outgoing calls on the line. The options are <b>Never</b> , <b>Always</b> or <b>POTS</b> (only if the call was originated by an analog extension). *The default is <b>Never</b> except for the following locales; for Italy the default is <b>POTS</b> , for New Zealand the default is <b>Always</b> .                                                                                                                                                                                                                                                                                                                                                      |
| <b>Progress Replacement</b>                          | <p>Default = None.</p> <p>Progress messages are defined in the Q.931 ISDN connection control signaling protocol. Generally, if a progress message is sent, the caller does not get connected and so typically does not accrue call costs.</p> <p>Not all ISDN lines support Q.931 Progress messages. Use this setting to configure alternative signaling to the ISDN line for internally generated Progress messages. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Alerting</b>: Map to Q.931 Alerting. The call is not connected. The caller does not hear the message and typically does not accrue call costs.</li> <li>• <b>Connect</b>: Map to Q.931 Connect. The caller hears the message and typically will accrue call costs.</li> </ul> |
| <b>Supports Partial Rerouting</b>                    | <p>Default = Off.</p> <p>Partial rerouting (PR) is an ISDN feature. It is supported on external (non-network and QSIG) ISDN exchange calls. When an external call is transferred to another external number, the transfer is performed by the ISDN exchange and the channels to the system are freed. Use of this service may need to be requested from the line provider and may incur a charge.</p>                                                                                                                                                                                                                                                                                                                                                                |
| <b>Force Number Plan to ISDN</b>                     | <p>Default = Off.</p> <p>This option is only configurable when <b>Support Partial Rerouting</b> is also enabled. When selected, the plan/type parameter for Partial Rerouting is changed from <b>Unknown/Unknown</b> to <b>ISDN/Unknown</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Send Redirecting Number</b>                       | <p>Default = Off.</p> <p>This option can be used on ISDN trunks where the redirecting service is supported by the trunk provider. Where supported, on twinned calls the caller ID of the original call is passed through to the twinning destination. This option is only used for twinned calls.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Support Call Tracing</b>                          | <p>Default = Off. The system supports the triggering of malicious caller ID (MCID) tracing at the ISDN exchange. Use of this feature requires liaison with the ISDN service provider and the appropriate legal authorities to whom the call trace will be passed. The user will also need to be enabled for call tracing and be provider with either a short code or programmable button to activate MCID call trace. Refer to Malicious Call Tracing in the Telephone Features section for full details.</p>                                                                                                                                                                                                                                                        |
| <b>Active CCBS Support</b>                           | <p>Default = Off.</p> <p>Call completion to a busy subscriber (CCBS). It allows automatic callback to be used on outgoing ISDN calls when the destination is busy. This feature can only be used on point-to-point trunks. Use of this service may need to be requested from the line provider and may incur a charge.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Channels

Navigation: **System Settings > Line > Add/Edit Trunk Line > BRI Line > Channels**

This tab allows settings for individual channels within the trunk to be adjusted. To edit a channel either double-click on it or click the channel and then select **Edit**.

To edit multiple channels at the same time, select the required channels using Ctrl or Shift and then click **Edit**. When editing multiple channels, fields that must be unique such as **Line Appearance ID** are not shown.

These settings can be edited online.

| Field                     | Description                                                                                                                                                                                                                                                                                                      |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Line Appearance ID</b> | Default = Auto-assigned. Range = 2 to 9 digits.<br>Used for configuring Line Appearances with button programming. The line appearance ID must be unique and not match any extension number. Line appearance is not supported for trunks set to QSIG operation and is not recommended for trunks be used for DID. |

## H.323 Line

Navigation: **System Settings > Line > Add/Edit Trunk Line > H323 Line**

These lines are added manually. They allow voice calls to be routed over data links within the system. They are therefore dependent on the IP data routing between the system and the destination having being configured and tested.

Calls received on IP, S0 and QSIG trunks do not use incoming call routes. Routing for these is based on incoming number received as if dialed on-switch. Line short codes on those trunks can be used to modify the incoming digits.

### Network Assessments

Not all data connections are suitable for voice traffic. A network assessment is required for internal network connections. For external network connections a service level agreement is required from the service provider. Avaya cannot control or be held accountable for the suitability of a data connection for carrying voice traffic.

QSIG trunks are not supported on IP500 V2 systems without IP500 Voice Networking licenses.

This type of configuration record can be saved as a template and new records created from a template. See [Working with Templates](#) on page 810.

## H.323 Line Short Codes

Navigation: **System Settings > Line > Add/Edit Trunk Line > H323 Line > Short Codes**

For some types of line, Line short codes can be applied to any digits received with incoming calls.

The line Short Code tab is shown for the following trunk types which are treated as internal or private trunks: **QSIG** (T1, E1, H.323), **BRI S0**, **H.323**, **SCN**, **IP Office**. Incoming calls on those

types of trunk are not routed using **Incoming Call Route** settings. Instead the digits received with incoming calls are checked for a match as follows:

Extension number (including remote numbers in a multi-site network).

- Line short codes (excluding ? short code).
- System short codes (excluding ? short code).
- Line ? short code.
- System ? short code.

Short codes can be added and edited using the **Add**, **Remove** and **Edit** buttons. Alternatively you can right-click on the list of existing short code to add and edit short codes.

These settings can be edited online.

| Field                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Codec Selection</b>                          | <p>Default = System Default</p> <p>Set the supported codecs. Where possible, Avaya recommend that you use the same set of codecs for all IP Office systems, lines, and extensions.</p> <p>The options are:</p> <ul style="list-style-type: none"> <li>• <b>System Default</b> - Use the codec list set in the system settings.</li> <li>• <b>Custom</b> - Configure a list of codec preferences for the line. <ul style="list-style-type: none"> <li>- You can move codecs between the <b>Unused</b> and <b>Selected</b> sets and change the order of the codecs.</li> <li>- The codecs available are set by <b>System Settings &gt; System &gt; VoIP</b>. The possible codecs are: <ul style="list-style-type: none"> <li>• <b>OPUS</b> - Supported on Linux-based IP Office systems only.</li> <li>• <b>G.711 ALAW/G.711 ULAW</b></li> <li>• <b>G.729</b></li> <li>• <b>G.723.1</b> - Supported on IP500 V2 systems only.</li> <li>• <b>G.722 64K</b> - Supported by Linux-based IP Office systems and on IP500 V2 systems with IP500 VCM, IP500 VCM V2 or IP500 Combo cards.</li> </ul> </li> </ul> </li> </ul> |
| <b>Supplementary Services</b>                   | <p>Default = H450.</p> <p>Selects the supplementary service signaling method for use across the H.323 trunk. The remote end of the trunk must support the same option. The options are:</p> <ul style="list-style-type: none"> <li>• <b>None</b>: No supplementary services are supported.</li> <li>• <b>H450</b>: Use for H.323 lines connected to another PBX or device that uses H450.</li> <li>• <b>QSIG</b>: Use for H.323 lines connected to another PBX or device that uses QSIG.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Call Initiation Timeout</b>                  | <p>Default = 4 seconds. Range = 1 to 99 seconds.</p> <p>This option sets how long the system should wait for a response to its attempt to initiate a call before following the alternate routes set in an ARS form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>VoIP Silence Suppression</b>                 | <p>Default = Off.</p> <p>When selected, this option will detect periods of silence on any call over the line and will not send any data during those silent periods. This feature is not used on IP lines using <b>G.711</b> between systems. On trunk's between networked systems, the same setting should be set at both ends.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Enable FastStart for non-Avaya IP Phones</b> | <p>Default = Off</p> <p>A fast connection procedure. Reduces the number of messages that need to be exchanged before an audio channel is created.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Field                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Fax Transport Support</b>        | <p>Default = Off</p> <p>This option is only supported on trunks with their <b>Supplementary Services</b> set to <b>IP Office SCN</b> or <b>IP Office Small Community Network - Fallback</b>. Fax relay is supported across H.323 multi-site network lines with <b>Fax Transport Support</b> selected. This will use 2 VCM channels in each of the systems. Fax relay is only supported on IP500 V2 systems with IP500 VCM, IP500 VCM V2 and or IP500 Combo cards. Fax relay is not supported on Server Edition Linux servers.</p>                                                                                                                                                                                                                                                                                                                            |
| <b>Local Tones</b>                  | <p>Default = Off</p> <p>When selected, the tones are generated by the local system to which the phone is registered. This option should not be used with lines being used for a multi-site network.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>DTMF Support</b>                 | <p>Default = Out of Band</p> <p>DTMF tones can be sent to the remote end either as DTMF tones within the calls audio path (<b>In Band</b>) or a separate signals (<b>Out of Band</b>). Out of Band is recommended for compression modes such as G.729 and G.723 compression modes where DTMF in the voice stream could become distorted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Allow Direct Media Path</b>      | <p>Default = On</p> <p>This settings controls whether calls between IP endpoints and/or lines must go through the IP Office.</p> <ul style="list-style-type: none"> <li>• If disabled, calls go through the IP Office and use its resources. RTP relay allows calls between devices using the same audio codec to not require a voice compression channel.</li> <li>• If enabled, calls can take routes other than through the IP Office system. Both ends must support direct media and have matching VoIP settings. For example, both ends must use the same protocol (SIP or H.323), same addressing (IPv4 or IPv6), and so on. Otherwise, the call goes through the IP Office system.</li> </ul> <p>- For extensions, disabling <b>Requires DTMF</b> allows the extension to attempt direct media even if the other end has differing DTMF settings.</p> |
| <b>Progress Ends Overlap Send</b>   | <p>Default = Off.</p> <p>Some telephony equipment, primarily AT&amp;T switches, over IP trunks send a H.323 Progress rather than H.323 Proceeding message to signal that they have recognized the digits sent in overlap state. By default the system expects an H.323 Proceeding message. This option is not available by default. If required, the value <b>ProgressEndsOverlapSend</b> must be entered into the Source Numbers tab of the NoUser user.</p>                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Default Name From Display IE</b> | <p>Default = Off.</p> <p>When set, the Display IE is used as the default source for the name.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## IP DECT

Navigation: **System Settings > Line > Add/Edit Trunk Line > IP DECT Line**

You can add this type of line manually. The line is then used to route voice calls over IP to an Avaya Wireless DECT system. Only one IP DECT line is supported. See the *Deploying Avaya Wireless DECT with IP Office* manual.

This type of configuration record can be saved as a template and new records created from a template. See [Working with Templates](#) on page 810.

## IP DECT Line

Navigation: **System Settings > Line > Add/Edit Trunk Line > IP DECT Line > Line**

When creating an IP DECT line, these settings are mergeable. You can also remove an IP DECT line without rebooting. Changing an IP DECT line that has been imported into the configuration is not mergeable.

| Field                                  | Description                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Line Number</b>                     | This number is allocated by the system and is not adjustable.                                                                                                                                                                                                                                                                                                                              |
| <b>Associated Extensions</b>           | Lists all the DECT extensions associated with the IP DECT line by the extension's <b>DECT Line ID</b> setting.                                                                                                                                                                                                                                                                             |
| <b>Call based Location Information</b> | If enabled, the DECT extension location can be overridden on a call-by-call basis using the location specified in the base station configuration. Supported with R11.1 FP2 SP2 and higher. Requires each base station to be configured with a location ID that matches a location in the IP Office configuration. Refer to the <i>Deploying Avaya Wireless DECT with IP Office</i> manual. |
| <b>Description</b>                     | Default = Blank. Maximum 31 characters.<br><br>You can use this field to enter a description for the configuration entry. The description is not used elsewhere.                                                                                                                                                                                                                           |

## VoIP

Navigation: **System Settings > Line > Add/Edit Trunk Line > IP DECT Line > VoIP**

Used to configure the VoIP setting applied to calls on the IP DECT line.

When creating an IP DECT line, these settings are mergeable. You can also remove an IP DECT line without rebooting. Changing an IP DECT line that has been imported into the configuration is not mergeable.

| Field                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## IP Office Line

Navigation: **System Settings > Line > Add/Edit Trunk Line > IP Office Line**

This line type is used to connect two IP Office systems.

In previous releases, connecting two IP Office systems was achieved using H.323 Lines configured with **Supplementary Services** set to **IP Office SCN**. In the current release, the IP Office line type is used to connect IP Office systems. Separating out the IP Office line type from the H.323 line type allows for the logical grouping of features and functions available when connecting two IP Office systems, including IP Office systems connected through the cloud.

#### **Note:**

Setting an IP Office line with **Transport Type = Proprietary** and **Networking Level = SCN** will interwork with a previous release system configured with an H.323 SCN line.

| Field                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Password</b><br><b>Confirm Password</b> | <p>Default = Blank.</p> <p>The <b>Password</b> field is enabled when <b>Transport Type</b> is set to <b>WebSocket Server</b> or <b>WebSocket Client</b>.</p> <p>WebSockets are bi-directional HTTP or HTTPS communication pipes initiated from a client to a server. They permit clients behind local a firewall to traverse the internet to a server by using well known ports and protocols. A matching password must be set at each end of the line.</p> |
| <b>Port</b>                                | <p>When <b>Transport Type</b> is set to <b>Proprietary</b>, the default port is 1720 and cannot be changed.</p> <p>When <b>Transport Type</b> is set to <b>WebSocket Client</b>, the default port is 80.</p> <p>The <b>Port</b> field is not available when <b>Transport Type</b> is set to <b>WebSocket Server</b>. The HTTP and HTTPS receive ports are defined at the system level in the security settings <b>System Details</b> tab.</p>               |

## SCN Resiliency Options

These options are only available when the **Networking Level** option is set to **SCN**. The intention of this feature is to attempt to maintain a minimal level of operation while problems with the local system are resolved.

For information on the **SCN Resiliency Options**, refer to *IP Office Resilience Overview*.

| Field                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Supports Resiliency</b>   | <p>Default = Off.</p> <p>These fields are available when <b>Networking Level</b> is set to <b>SCN</b>. When selected, all the available options are defaulted to <b>On</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Backs up my IP Phones</b> | <p>Default = Off.</p> <p>When selected, the local system shares information about the registered phones and users on those phones with the backup system. If the local system is no longer visible to the phones, the phones will reregister with the backup system. When phones have registered with the backup system, they show an <b>R</b> on their display.</p> <p>Note that while IP Office line settings are mergeable, changed to this setting require the IP phones to be restarted in order to become aware of the change in their failover destination.</p> <p>If the setting <b>System Settings &gt; System &gt; Telephony &gt; Phone Failback</b> is set to <b>Automatic</b>, and the phone's primary server has been up for more than 10 minutes, the backup system causes idle phones to perform a failback recovery to the original system.</p> <p>If using resilience backup to support Avaya IP phones, <b>Auto-create Extn</b> and <b>Auto-create User</b> should not be left enabled after initial configuration or any subsequent addition of new extensions and users. Leaving auto-create options enabled on a system that is a failover target may cause duplicate extension/user records on the multi-site network under multiple failure scenarios.</p> |

| Field                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Backs up my Hunt Groups</b>    | <p>Default = Off.</p> <p>This option is available only on the IP Office Line connecting the Server Edition Primary server to the Server Edition Secondary server.</p> <p>When selected, any hunt groups the local system is advertising to the network are advertised from the backup system when fallback is required. The trigger for this occurring is phones registered with the local system registering with the backup system, ie. <b>Backs up my IP Phones</b> above must also be enabled.</p> <p>When used, the only hunt group members that will be available are as follows:</p> <ul style="list-style-type: none"> <li>• If the group was a distributed hunt group, those members who were remote members on other systems are still visible within the network.</li> <li>• Any local members who have hot desked to another system still visible within the network.</li> </ul> <p>When the local system becomes visible to the backup system again, the groups will return to be advertised from the local system.</p> |
| <b>Backs up my Voicemail</b>      | <p>Default = Off.</p> <p>This option can be used if the local system is hosting the Voicemail Pro server being used by the network. If selected, when the local system is no longer visible to the voicemail server, the backup system acts as host for the voicemail server. In a Server Edition network, this option is only available on the H.323 trunk from the Primary Server to the Secondary Server. It is assumed to be on and is automatically set by the Resilience Administration tool.</p> <p>The option requires the backup system to have licenses for the Voicemail Pro features that are required to operate during any fallback period.</p>                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Backs up my IP DECT Phones</b> | <p>Default = Off.</p> <p>This option is used for Avaya IP DECT phones registered with the system. When selected, it will share information about the registered phones and users on those phones with the backup system.</p> <p>If the local system is no longer visible to the phones, the phones will reregister with the backup system. The users who were currently on those phones will appear on the backup system as if they had hot desked. Note that when the local system is restored to the network, the phones will not automatically re-register with it. A phone reset via either a phone power cycle or using the System Status Application is required. When phones have registered with the backup system, they will show an <b>R</b> on their display.</p> <p> <b>Note:</b></p> <p>Only one IP Office Line can have this configuration parameter set to On.</p>                                                                 |

## IP Office Line Short Codes

Navigation: **System Settings > Line > Add/Edit Trunk Line > IP Office Line > Short Codes**

Incoming calls on IP Office Lines are not routed using Incoming Call Route settings.

Short codes can be added and edited using the **Add**, **Remove** and **Edit** buttons. Alternatively you can right-click on the list of existing short code to add and edit short codes.

These settings can only be edited offline. Changes to these settings require a reboot of the system. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

## T38 Fax

Navigation: **System Settings > Line > Add/Edit Trunk Line > IP Office Line > T38 Fax**

The settings are available only on IP500 V2 since it can terminate T38 fax. On the **VoIP** settings for the line type, **Fax Transport Support** must be set to **T38** or **T38 Fallback**.

These settings are mergeable.

## SIP DECT Base

Navigation: **System Settings > Line > Add/Edit Trunk Line > Legacy SIP DECT Line > SIP DECT Base**

The IP Office can support up to four D100 Base Stations. Each connects to the IP Office using a **Legacy SIP DECT Line**.

These settings are not mergeable. Changes to these settings requires a reboot of the system.

| Field                        | Description                                                                                                                                                                                                                                             |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Line Number</b>           | Default = Blank. A unique line number associated with the SIP DECT Base Station.                                                                                                                                                                        |
| <b>Associated Extensions</b> | Lists the SIP DECT extensions associated with the line through the extension's <b>SIP DECT Line</b> setting.                                                                                                                                            |
| <b>Base Name</b>             | Default = Blank. Maximum 16 characters.<br><br>A name assigned to the base station. Each base station provisioned on the IP Office must have a unique name. The field cannot be blank. The format is an alphanumeric string with no special characters. |
| <b>Base MAC Address</b>      | Default = Blank.<br><br>The MAC Address of the base station. If only one base station is provisioned, the field can remain at the default value. If multiple base stations are provisioned, the MAC address for each base station must be entered.      |
| <b>Configure Base IP</b>     |                                                                                                                                                                                                                                                         |
| <b>Configure Base IP</b>     | Default = Off.<br><br>Set to <b>On</b> to configure IP address attributes for the base station. When enabled, the Configure Base IP settings are displayed.                                                                                             |
| <b>DHCP Client</b>           | Default = On.<br><br>When enabled, specifies that the base station operates as a DHCP client. When enabled, not other IP address attributes can be configured.                                                                                          |
| <b>IP Address</b>            | Default = Blank.<br><br>The IP address of the base station. The IP address must be on the same subnet as one of the LAN interfaces.                                                                                                                     |
| <b>IP Mask</b>               | Default = Blank.<br><br>IP address mask.                                                                                                                                                                                                                |
| <b>IP Gateway</b>            | Default = Blank.<br><br>The default gateway address                                                                                                                                                                                                     |
| <b>Provisioning Server</b>   | Default = IP Office interface address.<br><br>The server address from where the Base Station configuration files can be retrieved.                                                                                                                      |

## MS Teams Line

IP Office can be configured as the telephony service for calls made to and from Microsoft Teams. The MS Teams Line settings uses a private SIP trunk connection with Session Border Controller (SBC).

Only one MS Teams line is supported, including for networked IP Office systems. For IP Office Server Edition and Select, the line should be configured on the primary server.

For details, see the *Deploying MS Teams Direct Routing with IP Office* manual.

## Additional configuration information

For additional information regarding the **Media Connection Preservation** setting, see [Media Connection Preservation](#) on page 747.

## Configuration settings

These settings cannot be edited online. Changes to these settings require a reboot of the system.

Changing the **In Service** setting to **Disabled** (out of service) requires a system reboot. However, changing the **In Service** setting to **Enabled** is mergeable. Configuration changes made while the line is out of service are also mergeable.

|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Local Domain Name</b>             | <p>Default = Blank.</p> <p>An IP address or SIP domain name as required by the service provider.</p> <p>When configured, the <b>Local Domain Name</b> value is used in the following:</p> <ul style="list-style-type: none"> <li>• <b>From</b> and <b>Contact</b> headers</li> <li>• <b>PAI header</b>, when the setting <b>SIP Line &gt; SIP Advanced &gt; Use Domain for PAI</b> is checked</li> <li>• <b>Diversion</b> header</li> </ul> <p>If both the <b>ITSP Domain Name</b> and the <b>Local Domain Name</b> are configured, then <b>Local Domain</b> takes precedence.</p> <p><b>Local Domain Name</b> is not used in the <b>Remote Party ID</b> header.</p> |
| <b>Proxy Address</b>                 | <p>Default- Blank</p> <p>Enter the proxy address to send the packet.</p> <p>Example: ms-teams.com</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Outgoing Group ID</b>             | <p>Default = 97777</p> <p>This value is not changeable. It can be used by short codes to route calls to the line.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Prefix</b>                        | <p>Default = Blank</p> <p>This prefix is added to any source number received with incoming calls.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Max Calls</b>                     | <p>Default = 10</p> <p>Sets the number of simultaneous calls allowed using this line.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>URI Type</b>                      | <p>Default = SIP.</p> <p>When <b>SIP</b> or <b>SIP URI</b> is selected, the SIP URI format is used (for example, name@example.com). This affects the <b>From</b> field of outgoing calls. The <b>To</b> field for outgoing calls always uses the format specified by the short codes used for outgoing call routing.</p> <p>Recommendation: When SIP Secured URI is required, the <b>URI Type</b> should be set to <b>SIP URI</b>.</p> <p><b>SIP URI</b> can be used only when <b>Layer 4 Protocol</b> is set to <b>TLS</b>.</p>                                                                                                                                     |
| <b>Media Connection Preservation</b> | <p>Default = Enabled.</p> <p>When enabled, the system attempts to maintain established calls despite brief network failures. Call handling features are not available when a call is in a preserved state. When the <b>Media Connection Preservation</b> setting is enabled, it applies to Avaya H.323 phones that support connection preservation.</p>                                                                                                                                                                                                                                                                                                              |
| <b>Location</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Engineering

Navigation: **Line | MS Teams Line | Engineering**

You can use this tab to enter commands that apply special features to the SIP line. The commands are called SIP Line Custom (SLIC) strings.

These settings can be edited online. Changes to these settings do not require a reboot of the system.

### reINVITE Codec Renegotiation

For R11.0 and higher, the IP Office supports codec renegotiation when a `reINVITE` is received. See [Codec selection](#) on page 954.

You can use the following command to retain the pre-R11.0 behavior of no renegotiation. Note: On existing IP Office systems upgraded to R11.0 or higher, this command is automatically added to all existing SIP lines.

- `SLIC_PREFER_EXISTING_CODEC`

### Calling Number Validation

You can use the following commands to control calling number validation. See [SIP Calling Number Verification \(STIR/SHAKEN\)](#) on page 963.

- `SLIC_STIR_REJECT_CODE=<n>` where `<n>` is the response code sent for calls rejected by the IP Office.
- `SLIC_STIR_REJECT_STRING=<y>` where `<y>` is the response string sent for calls rejected by the IP Office.
- `SLIC_STIR_ATTEST="<w>"` where `<w>` is the name of the header the IP Office checks for a call's authorization level.
- `SLIC_STIR_CUSTOM=<z>` where `<z>` value enables or disables various call features.

### Server Name Identification (SNI)

The following SLIC codes can be used for SIP trunks using TLS. When used:

- On outgoing connections, the IP Office adds Server Name Indication (SNI) information to the SAN field it sends.

- If the IP Office system's **Received certificate checks (Telephony endpoints)** settings is set to **Medium + Remote Checks** or **High + Remote Checks**, then the SLIC value is also used to validate the received certificates SAN.

The SLIC codes are:

- `SLI_ADD_SIP_SAN=<X>`

Use a SNI set to `sip:<SNI>` where the `<SNI>` value is taken from the existing IP Office SIP line configuration based on the following values of `<X>` as below:

- **D** = Use the value of the SIP line's **ITSP Domain Name** setting (**Line > SIP Line**). For example, for a SIP line with the **ITSP Domain Name** set to `ipo.example.com`, adding `SLI_ADD_SIP_SAN=D` sets the SNI added to `sip:ipo.example.com`.
- **P** = Use the value of the SIP line's configured **ITSP Proxy Address** setting (**Line > Transport >** ). This option is only supported for a **ITSP Proxy Address** set to a single address. For example: `SLI_ADD_SIP_SAN=P`

## Keepalives

Supported with IP Office R11.1.3.1 and higher.

You can add `SLIC_HNT_EMPTY_PACKET` to have the SIP line send RTP packets with payload 20 (unassigned payload) and no data as keepalives. This overrides the default of send STUN packets for keepalives.

# PRI Trunks

PRI trunks are provided by the installation of a PRI trunk card into the control unit. avThe IP500 PRI-U trunk card can be configured (see below) to one of those line types. The cards are also available with either 1 or 2 physical ports. The number of B-channels supported by each physical port depends on the line type of the card.

- **E1**: 30 B-channels and 1 D-channel per port.
- **T1**: 24 B-channels per port.
- **US PRI**: 23 B-channels and 1 D-channel per port.
- **E1-R2**: 30 B-channels and 1 D-channel per port.

## IP500 PRI-U Trunk Card Line Type

The IP500 PRI-U card can be configured to support either E1, T1 or E1-R2 PRI line types. To select the line type required, right-click on the line in the group or navigation pane and select **Change Universal PRI Card Line Type**.

The control unit supports 8 B-channels on each IP500 PRI-U card fitted. Additional B-channels up to the full capacity of IP500 PRI-U ports installed require licenses added to the configuration. D-channels are not affected by licensing.

- For ETSI and QSIG trunks, license instances are consumed by the number of calls in progress on B-channels.
- For T1, E1R2 and ETSI CHI trunks, license instances are consumed by the channels set as in service.

| <b>Card/Module</b>        | <p>Indicates the card slot or expansion module being used for the trunk device providing the line.</p> <p>For IP500 V2 control units: 1 to 4 match the slots on the front of the control unit from left to right. Expansion modules are numbered from 5 upwards, for example trunks on the module in Expansion Port 1 are shown as 5.</p>                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Port</b>               | Indicates the port on the Card/Module above to which the configuration settings relate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Network Type</b>       | <p>Default = Public.</p> <p>This option is available when <b>System   Telephony   Telephony   Restrict Network Interconnect</b> is enabled. It allows you to configure trunks as either <b>Public</b> or <b>Private</b>.</p> <ul style="list-style-type: none"> <li>• The IP Office will return number busy indication to any attempt to connect a call on a <b>Private</b> trunk to a <b>Public</b> trunk or the opposite.</li> <li>• The call restriction includes transfers, forwarding and conference calls.</li> <li>• Avaya does not recommended use of this feature on IP Office systems using any of the following features: multi-site networks, VPNremote, application telecommuter mode.</li> </ul> |
| <b>Telephone Number</b>   | Used to remember the external telephone number of this line to assist with loop-back testing. For information only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Channel Allocation</b> | <p>Default = 30 1.</p> <p>For lines set to <b>ETSI CHI</b>, this option allows the system to select the default order in which channels should be used for outgoing calls. Typically this is set as the opposite of the default order in which the central office exchange uses channels for incoming calls.</p> <p>For lines set to the <b>Line Sub Type</b> of <b>ETSI CHI</b>, the <b>Incoming Group ID</b> is set as part of the individual channel settings.</p>                                                                                                                                                                                                                                          |
| <b>Incoming Group ID</b>  | <p>Default = 0, Range 0 to 99999.</p> <p>The Incoming Group ID to which a line belongs is used to match it to incoming call routes in the system configuration. The matching incoming call route is then used to route incoming calls. The same ID can be used for multiple lines.</p>                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Field                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Outgoing Group ID</b>    | <p>Default = 1. Range 0 to 99999.</p> <p>When a short code specifies a number to dial, the IP Office will seize an available line from those available with a matching <b>Outgoing Group ID</b>.</p> <p>In a Server Edition/Select network, the <b>Outgoing Group ID</b> used for lines to a system must be unique within the network.</p> <p><b>Reserved Group ID Numbers:</b></p> <ul style="list-style-type: none"> <li>• <b>0</b> - In a Server Edition/Select network, the ID 0 cannot be used.</li> <li>• <b>90000 - 99999</b> - Reserved for system use (not enforced). <ul style="list-style-type: none"> <li>- <b>96666</b> - Use for ACO lines.</li> <li>- <b>98888</b> - For IP Office deployed in an Enterprise Branch environment, reserved for the SM line.</li> <li>- <b>99001 - 99148</b> - In a Server Edition/Select network, reserved for the IP Office lines from the primary and secondary servers to each expansion system in the network.</li> <li>- <b>99998</b> - In a Server Edition/Select network, reserved for the IP Office lines to the secondary server.</li> <li>- <b>99999</b> - In a Server Edition/Select network, reserved for the IP Office lines to the primary server.</li> </ul> </li> </ul> |
| <b>Prefix</b>               | <p>Default = Blank.</p> <p>The prefix is used in the following ways:</p> <ul style="list-style-type: none"> <li>• <b>For incoming calls</b> The ISDN messaging tags indicates the call type (National, International or Unknown). If the call type is unknown, then the number in the Prefix field is added to the ICLID.</li> <li>• <b>For outgoing calls</b> The prefix is not stripped, therefore any prefixes not suitable for external line presentation should be stripped using short codes.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>National Prefix</b>      | <p>Default = 0</p> <p>This indicates the digits to be prefixed to a incoming national call. When a number is presented from ISDN as a "national number" this prefix is added. For example 1923000000 is converted to 01923000000.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>International Prefix</b> | <p>Default = 00</p> <p>This indicates the digits to be prefixed to an incoming international call. When a number is presented from ISDN as an "international number" this prefix is added. For example 441923000000 is converted to 00441923000000.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>TEI</b>                  | <p>Default = 0 The</p> <p>Terminal Equipment Identifier. Used to identify each Control Unit connected to a particular ISDN line. For Point to Point lines this is typically (always) 0. It can also be 0 on a Point to Multi-Point line, however if multiple devices are sharing a Point to Multi-Point line it should be set to 127 which results in the exchange deciding on the TEI's to be used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Number of Channels</b> | Defines the number of operational channels that are available on this line. Up to 30 for E1 PRI, 23 for T1 PRI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Outgoing Channels</b>  | This defines the number of channels available, on this line, for outgoing calls. This should normally be the same as <b>Number of Channels</b> field, but can be reduced to ensure incoming calls cannot be blocked by outgoing calls. Only available when the <b>Line Sub Type</b> is set to <b>ETSI</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Voice Channels</b>     | The number of channels available for voice use. Only available when the <b>Line Sub Type</b> is set to <b>ETSI</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Data Channels</b>      | The number of channels available for data use. Only available when the <b>Line Sub Type</b> is set to <b>ETSI</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>CRC Checking</b>       | Default = On<br>Switches CRC on or off.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Line Signalling</b>    | <p>Default = CPE This option is not used for lines where the <b>Line SubType</b> is set to <b>QSIG</b>. Select either <b>CPE</b> (customer premises equipment) or <b>CO</b> (central office). The <b>CO</b> feature is intended to be used primarily as a testing aid. It allows PRI lines to be tested in a back-to-back configuration, using crossover cables.</p> <p>The CO feature operates on this line type by modifying the way in which incoming calls are disconnected for system configuration in Brazil and Argentina. In these locales, the CO setting uses Forced-Release instead of Clear-Back to disconnect incoming calls. The Brazilian Double-Seizure mechanism, used to police Collect calls, is also disabled in CO mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Clock Quality</b>      | <p>Default = Network</p> <p>Refer to the IP Office Installation Manual for full details. This option sets whether the system should try to take its clock source for call synchronization and signalling from this line. Preference should always be given to using the clock source from a central office exchange if available by setting at least one exchange line to <b>Network</b>.</p> <ul style="list-style-type: none"> <li>• If multiple lines are set as <b>Network</b>, the order in which those lines are used is described in the IP Office Installation Manual. If additional lines are available, <b>Fallback</b> can be used to specify a clock source to use should the <b>Network</b> source not be available.</li> <li>• Lines from which the clock source should not be taken should be set as <b>Unsuitable</b>.</li> <li>• If no clock source is available, the system uses its own internal 8KHz clock source.</li> <li>• In scenarios where several systems are network via digital trunk lines, care must be taken to ensure that all the systems use the same clock source. The current source being used by a system is reported within the System Status Application.</li> </ul> |

| Field                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Add 'Not-end-to-end ISDN' Information Element</b> | <p>Default = Never</p> <p>Sets whether the optional 'Not end-to-end ISDN' information element should be added to outgoing calls on the line. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Never</b></li> <li>• <b>Always</b></li> <li>• <b>POTS</b>(only if the call was originated by an analog extension).</li> </ul> <p>The default is <b>Never</b> except for the following locales:</p> <ul style="list-style-type: none"> <li>• for Italy the default is <b>POTS</b>.</li> <li>• for New Zealand the default is <b>Always</b>.</li> </ul>                                                                                                                                                                                                  |
| <b>Progress Replacement</b>                          | <p>Default = None.</p> <p>Progress messages are defined in the Q.931 ISDN connection control signaling protocol. Generally, if a progress message is sent, the caller does not get connected and so typically does not accrue call costs.</p> <p>Not all ISDN lines support Q.931 Progress messages. Use this setting to configure alternative signaling to the ISDN line for internally generated Progress messages. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Alerting</b>: Map to Q.931 Alerting. The call is not connected. The caller does not hear the message and typically does not accrue call costs.</li> <li>• <b>Connect</b>: Map to Q.931 Connect. The caller hears the message and typically will accrue call costs.</li> </ul> |
| <b>Supports Partial Rerouting</b>                    | <p>Default = Off.</p> <p>Partial rerouting (PR) is an ISDN feature. It is supported on external (non-network and QSIG) ISDN exchange calls. When an external call is transferred to another external number, the transfer is performed by the ISDN exchange and the channels to the system are freed. Use of this service may need to be requested from the line provider and may incur a charge.</p>                                                                                                                                                                                                                                                                                                                                                                |
| <b>Force Number Plan to ISDN</b>                     | <p>Default = Off.</p> <p>This option is only configurable when <b>Support Partial Rerouting</b> is also enabled. When selected, the plan/type parameter for Partial Rerouting is changed from <b>Unknown/Unknown</b> to <b>ISDN/Unknown</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Send Redirecting Number</b>                       | <p>Default = Off.</p> <p>This option can be used on ISDN trunks where the redirecting service is supported by the trunk provider. Where supported, on twinned calls the caller ID of the original call is passed through to the twinning destination. This option is only used for twinned calls.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Field                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Support Call Tracing</b>                                         | <p>Default = Off.</p> <p>The system supports the triggering of malicious caller ID (MCID) tracing at the ISDN exchange. Use of this feature requires liaison with the ISDN service provider and the appropriate legal authorities to whom the call trace will be passed. The user will also need to be enabled for call tracing and be provider with either a short code or programmable button to activate MCID call trace. Refer to Malicious Call Tracing in the Telephone Features section for full details.</p> |
| <b>Active CCBS Support</b>                                          | <p>Default = Off.</p> <p>Call completion to a busy subscriber (CCBS). It allows automatic callback to be used on outgoing ISDN calls when the destination is busy. This feature can only be used on point-to-point trunks. Use of this service may need to be requested from the line provider and may incur a charge.</p>                                                                                                                                                                                           |
| <b>Passive CCBS</b>                                                 | <p>Default = Off.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Cost Per Charging Unit</b>                                       | <p>Advice of charge (AOC) information can be output in SMDR. The information is provided in the form of charge units. This setting is used to enter the call cost per charging unit set by the line provider. The values are 1/10,000th of a currency unit. For example if the call cost per unit is £1.07, a value of 10700 should be set on the line. See <a href="#">Advice of Charge</a> on page 742.</p>                                                                                                        |
| <b>Admin</b>                                                        | <p>Default = In Service.</p> <p>This field allows a trunk to be taken out of service if required for maintenance or if the trunk is not connected.</p>                                                                                                                                                                                                                                                                                                                                                               |
| <b>Send original calling party for forwarded and twinning calls</b> | <p>Default = Off.</p> <p>Use the original calling party ID when forwarding calls or routing twinned calls.</p> <p>This setting applies to the following ISDN lines:</p> <ul style="list-style-type: none"> <li>• PRI24 with subtypes: PRI, QSIGA, QSIGB, ETSI, ETSI CHI.</li> <li>• PRI30 with subtypes: QSIGA, QSIGB, ETSI, ETSI CHI.</li> </ul>                                                                                                                                                                    |
| <b>Originator number for forwarded and twinning calls</b>           | <p>Default = blank.</p> <p>The number used as the calling party ID when forwarding calls or routing twinned calls. This field is grayed out when the <b>Send original calling party for forwarded and twinning calls</b> setting is enabled.</p> <p>This setting applies to the following ISDN lines:</p> <ul style="list-style-type: none"> <li>• PRI24 with subtypes: PRI, QSIGA, QSIGB, ETSI, ETSI CHI.</li> <li>• PRI30 with subtypes: QSIGA, QSIGB, ETSI, ETSI CHI.</li> </ul>                                  |

The following fields are shown for a US T1 trunk card set to ETSI or QSIG operation. These cards have the same settings E1 PRI trunk cards set to ETSI or QSIG but only support 23 channels.

These settings are not mergeable. Changing these settings requires a system reboot.

| Field                | Description                                                                                                                                                                              |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CSU Operation</b> | Check this field to enable the T1 line to respond to loop-back requests from the line.                                                                                                   |
| <b>Haul Length</b>   | Default = 0-115 feet<br>Sets the line length to a specific distance.                                                                                                                     |
| <b>Channel Unit</b>  | Default = Foreign Exchange This field should be set to match the channel signaling equipment provided by the Central Office. The options are Foreign Exchange, Special Access or Normal. |

## E1 Short Codes

Navigation: **System Settings > Line > E1 Short Codes**

For some types of line, Line short codes can be applied to any digits received with incoming calls.

The line Short Code tab is shown for the following trunk types which are treated as internal or private trunks: **QSIG** (T1, E1, H.323), **BRI S0, H.323, SCN, IP Office**. Incoming calls on those types of trunk are not routed using **Incoming Call Route** settings. Instead the digits received with incoming calls are checked for a match as follows:

Extension number (including remote numbers in a multi-site network).

- Line short codes (excluding ? short code).
- System short codes (excluding ? short code).
- Line ? short code.
- System ? short code.

Short codes can be added and edited using the **Add**, **Remove** and **Edit** buttons. Alternatively you can right-click on the list of existing short code to add and edit short codes.

These settings can be edited online.

## E1 PRI Channels

Navigation: **System Settings > Line > E1 PRI Channels**

This tab allows settings for individual channels within the trunk to be adjusted. To edit a channel either double-click on it or click the channel and then select **Edit**.

To edit multiple channels at the same time, select the required channels using Ctrl or Shift and then click **Edit**. When editing multiple channels, fields that must be unique such as **Line Appearance ID** are not shown.

These settings must be edited offline. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

| Field                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Line Appearance ID</b> | <p>Default = Auto-assigned. Range = 2 to 9 digits.</p> <p>Used for configuring Line Appearances with button programming. The line appearance ID must be unique and not match any extension number. Line appearance is not supported for trunks set to QSIG operation and is not recommended for trunks be used for DID.</p> <p>If the trunk <b>Line Sub Type</b> is set to <b>ETSI CHI</b>, outgoing line appearance calls must use the corresponding channel.</p> |

The following additional fields are shown for lines where the **Line Sub Type** is set to **ETSI CHI**.

| Field                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Incoming Group ID</b> | Default = 0, Range 0 to 99999. The Incoming Group ID to which a line belongs is used to match it to incoming call routes in the system configuration. The matching incoming call route is then used to route incoming calls. The same ID can be used for multiple lines.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Outgoing Group ID</b> | <p>Default = 1. Range 0 to 99999.</p> <p>When a short code specifies a number to dial, the IP Office will seize an available line from those available with a matching <b>Outgoing Group ID</b>.</p> <p>In a Server Edition/Select network, the <b>Outgoing Group ID</b> used for lines to a system must be unique within the network.</p> <p><b>Reserved Group ID Numbers:</b></p> <ul style="list-style-type: none"> <li>• <b>0</b> - In a Server Edition/Select network, the ID 0 cannot be used.</li> <li>• <b>90000 - 99999</b> - Reserved for system use (not enforced). <ul style="list-style-type: none"> <li>- <b>96666</b> - Use for ACO lines.</li> <li>- <b>98888</b> - For IP Office deployed in an Enterprise Branch environment, reserved for the SM line.</li> <li>- <b>99001 - 99148</b> - In a Server Edition/Select network, reserved for the IP Office lines from the primary and secondary servers to each expansion system in the network.</li> <li>- <b>99998</b> - In a Server Edition/Select network, reserved for the IP Office lines to the secondary server.</li> <li>- <b>99999</b> - In a Server Edition/Select network, reserved for the IP Office lines to the primary server.</li> </ul> </li> </ul> |
| <b>Direction</b>         | <p>Default = Bothways</p> <p>The direction of calls on the channel. The options are: <b>Incoming, Outgoing, Bothways</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Bearer</b>            | <p>Default = Any</p> <p>The type of traffic carried by the channel. The options are: <b>Voice, Data, Any</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## E1-R2 Channels

Navigation: **System Settings > Line > E1–R2 Channels**

The channel settings are split into two sub-tabs, **E1R2 Edit Channel** and **Timers**.

The **Timers** tab displays the various timers provided for E1-R2 channels. These should only be adjusted when required to match the line provider's settings.

This tab allows settings for individual channels within the trunk to be adjusted. To edit a channel, select the required channel or channels and click **Edit**.

The following settings are mergeable: **Incoming Group ID**, **Outgoing Group ID**, **Admin**.

The remaining settings are not mergeable. Changes to these settings require a system reboot.

| Field                    | Descriptions                                                                                                                                                                                                                                                                           |

## E1–R2 MFC Group

Navigation: **System Settings > Line > E1–R2 MFC Group**

These settings must be edited offline. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

These tabs show the parameter assigned to each signal in an MFC group. The defaults are set according to the Country (Locale) on the Line tab. All the values can be returned to default by the **Default All** button on the **Advanced** tab.

These settings are not mergeable. Changes to these settings will require a reboot of the system.

To change a setting either double-click on it or right-click and select **Edit**.

## T1 Channels

Navigation: **System Settings > Line > T1 Channels**

The settings for each channel can be edited. Users have the option of editing individual channels by double-clicking on the channel or selecting and editing multiple channels at the same time. Note that the Line Appearance ID cannot be updated when editing multiple channels.

When editing a channel or channels, the settings available are displayed on two sub-tabs; T1 Edit Channel and Timers.

These settings must be edited offline. To enter offline editing, select **Menu Bar Current User Icon > Offline Mode**.

| Field                    | Description                                                                                                                                                                                                                                                                     |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Channel</b>           | Allocated by the system.                                                                                                                                                                                                                                                        |
| <b>Incoming Group ID</b> | Default = 0, Range 0 to 99999.<br><br>The Incoming Group ID to which a line belongs is used to match it to incoming call routes in the system configuration. The matching incoming call route is then used to route incoming calls. The same ID can be used for multiple lines. |

## Timer Settings

This sub-tab allows various timers relating to operation of an individual channel to be adjusted. These should only be adjusted to match the requirements of the line provider. The following is a list of the default values. To reset a value, click on the current value and then right click and select from the default, minimize and maximize options displayed.

**Incoming Automatic Delay:** 410.  
**Incoming Wink Delay:** 100.  
**Wink Signal:** 200.  
**Incoming Dial Guard:** 50.  
**First Incoming Digit:** 15000.  
**Incoming Inter Digit:** 5000.  
**Maximum Inter Digit:** 300.  
**Flash Hook Detect:** 240.  
**Incoming Disconnect:** 300.  
**Incoming Disconnect Guard:** 800.  
**Disconnected Signal Error:** 240000.  
**Outgoing Disconnect:** 300.  
**Outgoing Disconnect Guard:** 800.  
**Ring Verify Duration:** 220.  
**Ring Abandon:** 6300.  
**Ping Verify:** 600.  
**Long Ring Time:** 1100.

**Silent Interval:** 1100.  
**Outgoing Seizure:** 10.  
**Wink Start:** 5000.  
**Wink Validated:** 80.  
**Wink End:** 350.  
**Delay End:** 5000.  
**Outgoing Dial Guard:** 590.  
**Outgoing IMM Dial Guard:** 1500.  
**Outgoing Pulse Dial Break:** 60.  
**Outgoing Pulse Dial Make:** 40.  
**Outgoing Pulse Dial Inter Digit:** 720.  
**Outgoing Pulse Dial Pause:** 1500.  
**Flash Hook Generation:** 500.  
**Outgoing End of Dial:** 1000.  
**Answer Supervision:** 300.  
**Incoming Confirm:** 20.

## SIP Line

Navigation: **System Settings > Line > Add/Edit Trunk Line > SIP Line**

IP Office supports SIP voice calls through the addition of SIP lines to the system configuration. This approach allows users with non-SIP phones to make and receive SIP calls.

Deleting a SIP line requires a “merge with service disruption”. When the configuration file is sent to the system, the SIP trunk is restarted and all calls on the line are dropped.

This type of configuration record can be saved as a template and new records created from a template. See [Working with Templates](#) on page 810.

## SIP Line

Navigation: **System Settings > Line > Add/Edit Trunk Line > SIP Line > SIP Line**

### Configuration Settings

These settings are mergeable with the exception of the **Line Number** setting. Changing the **Line Number** setting requires a “merge with service disruption”. When the configuration file is sent to the system, the SIP trunk is restarted and all calls on the line are dropped.

Offline editing is not required.

| Field                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Name Priority</b> | <p>Default = System Default.</p> <p>For SIP trunks, the caller name displayed on an extension can either be that supplied by the trunk or one obtained by checking for a number match in the extension user's personal directory and the system directory. This setting determines which method is used by the line. The options are:</p> <ul style="list-style-type: none"> <li>• <b>System Default:</b> Use the system setting <b>System   Telephony   Telephony   Default Name Priority</b>.</li> <li>• <b>Favor Trunk:</b> Display the name provided by the trunk. For example, the trunk may be configured to provide the calling number or the name of the caller. The system should display the caller information as it is provided by the trunk. If the trunk does not provide a name, the system uses the <b>Favor Directory</b> method.</li> <li>• <b>Favor Directory:</b> Search for a number match in the extension user's personal directory and then in the system directory. The first match is used and overrides the name provided by the SIP line. If no match is found, the name provided by the line, if any, is used.</li> </ul> |
| <b>Description</b>   | <p>Default = Blank. Maximum 31 characters.</p> <p>You can use this field to enter a description for the configuration entry. The description is not used elsewhere.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Network Type</b>  | <p>Default = Public.</p> <p>This option is available when <b>System   Telephony   Telephony   Restrict Network Interconnect</b> is enabled. It allows you to configure trunks as either <b>Public</b> or <b>Private</b>.</p> <ul style="list-style-type: none"> <li>• The IP Office will return number busy indication to any attempt to connect a call on a <b>Private</b> trunk to a <b>Public</b> trunk or the opposite.</li> <li>• The call restriction includes transfers, forwarding and conference calls.</li> <li>• Avaya does not recommended use of this feature on IP Office systems using any of the following features: multi-site networks, VPNremote, application telecommuter mode.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>In Service</b>    | <p>Default = On.</p> <p>When this field is not selected, the SIP trunk is unregistered and not available to incoming and outgoing calls.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Check OOS</b>     | <p>Default = On.</p> <p>If enabled, the system will regularly check if the trunk is in service using the methods listed below. Checking that SIP trunks are in service ensures that outgoing call routing is not delayed waiting for response on a SIP trunk that is not currently usable.</p> <p>For UDP and TCP trunks, OPTIONS message are regularly sent. If no reply to an OPTIONS message is received the trunk is taken out of service.</p> <p>For trunks using DNS, if the IP address is not resolved or the DNS resolution has expired, the trunk is taken out of service.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Session Timers

| Field                  | Description                                                                                                                                                                                                                                                                                 |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Refresh Method</b>  | <p>Default = Auto.</p> <p>The options are: <b>Auto</b>, <b>Reinvite</b> or <b>Update</b>.</p> <p>When <b>Auto</b> is selected, if UPDATE is in the Allow: header from the far SIP endpoint, then it is used. Otherwise INVITE is used.</p>                                                  |
| <b>Timer (seconds)</b> | <p>Default = On Demand. Range = 90 to 64800</p> <p>This field specifies the session expiry time. At the half way point of the expiry time, a session refresh message is sent. When set to <b>On Demand</b>, IP Office will not send a session refresh message but will respond to them.</p> |

## Redirect and Transfer

Redirection and blind transfer are configured separately. By default, they are disabled.

A supervised transfer occurs when a consultation call is made and the REFER contains a Replaces: header indicating the CallID of another call leg which the REFERING agent has already initiated with the REFER target.

 **Note:**

- Do not change these settings unless directed to by the SIP service provider.

| Field                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Incoming Supervised REFER</b>  | <p>Default = Auto.</p> <p>Determines if IP Office will accept a REFER being sent by the far end. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Always:</b> Always accepted.</li> <li>• <b>Auto:</b> If the far end does not advertise REFER support in the Allow: header of the OPTIONS responses, then IP Office will reject a REFER from that endpoint.</li> <li>• <b>Never:</b> Never accepted.</li> </ul>                                                                  |
| <b>Outgoing Supervised REFER</b>  | <p>Default = Auto.</p> <p>Determines if IP Office will attempt to use the REFER mechanism to transfer a party to a call leg which IP Office has already initiated so that it can include the CallID in a Replaces: header. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Always:</b> Always use REFER.</li> <li>• <b>Auto:</b> Use the Allow: header of the OPTIONS response to determine if the endpoint supports REFER.</li> <li>• <b>Never:</b> Never use REFER.</li> </ul> |
| <b>Send 302 Moved Temporarily</b> | <p>Default = Off.</p> <p>A SIP response code used for redirecting an unanswered incoming call. It is a response to the INVITE, and cannot be used after the 200 OK has been sent as a response to the INVITE.</p>                                                                                                                                                                                                                                                                                 |

|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Outgoing Blind REFER</b> | <p>Default = Off.</p> <p>When enabled, a user, voicemail system or IVR can transfer a call by sending a REFER to an endpoint that has not set up a second call. In this case, there is no Replaces: header because there is no CallID to replace the current one. This directs the far end to perform the transfer by initiating the new call and release the current call with IP Office.</p> |

### Behavior during Service unavailable

A proxy server is considered Active once the system has received a response to an INVITE, REGISTER or OPTIONS.

In the case of the proxy server responding with 503 - Service Unavailable, it should be considered Active - In Maintenance. In this case, the following should occur:

- If the response 503 - Service Unavailable was in response to an INVITE request:
  - If calls are tied to registrations (**Calls Route via Registrar** enabled) and there are other proxies available, the tied registrations should issue an Un-REGISTER and try to REGISTER with a different proxy. The call should fail with cause = Temporary Fail.
  - If calls are not tied, the INVITE should be immediately tried to a different proxy.
- If the response 503 - Service Unavailable was in response to a REGISTER request:
  - If there are other proxies available, this registration only should issue an Un-REGISTER and try to REGISTER with a different proxy.
  - If **Explicit DNS Server(s)** are configured, a DNS request should be sent out to see whether the proxy server has disappeared from those being offered.

An Active-InMaintenance proxy server should not be used for a new transactions (INVITE or REGISTER) until:

- There is a change in DNS responses indicating the proxy has become active.
- The configuration does not leave any better option available. In this case, there should be a throttle so that no more than 5 failures (without successes) in 1 minute should be allowed.
- A configuration merge has occurred where the ITSP Proxy Address has been changed.
- 10 minutes has expired.

### Behavior during Not Responding

A proxy server that is not-responding (UDP) is indicated when 3 requests are sent and no replies are received. This would normally occur during a single INVITE transaction.

Consideration should be given whether this is caused by a local network fault or is caused by the Proxy being out of service. Since it is likely to be local, no action should be taken unless traffic is

received from an alternative proxy while this proxy is actually not responding. The state should be "Possibly non responding".

If explicit DNS servers are configured, a DNS request should be sent out to see whether this Proxy server has disappeared from those being offered.

If possible, an alternative proxy should be stimulated simultaneously with stimulating the suspect server.

The server should be considered non-responding if it is persistently non-responding while other proxies are responding or if it is non-responding and has disappeared from the DNS advertisement.

While in the "possibly not responding" state, it would be better to send an INVITE to an alternative proxy while simultaneously sending any appropriate message to this proxy. This will help to resolve whether it is really not responding rather than there being local network problems. However, there is no requirement to blacklist the proxy.

Once in the "definitely not responding" state:

- If there are other proxies available: this registration only issues an Un-REGISTER, and try to REGISTER with a different proxy. Calls do not automatically clear.
- If a SIP message is received from it, the state should immediately go "Active".
- This proxy should be blacklisted unless there are no better options available. While blacklisted, only one transaction per 10 minutes is allowed.
- Even if not blacklisted, there should be a throttle so that no more than 5 failures (without successes) in 1 minute should be allowed.

## Configuration settings

The **ITSP Proxy Address** and **Calls Route via Registrar** settings are mergeable. Changing the remaining settings requires a "merge with service disruption". When the configuration file is sent to the system, the SIP trunk is restarted and all calls on the line are dropped.

Offline editing is not required.

| Field                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ITSP Proxy Address</b>    | <p>Default = Blank</p> <p>This is the SIP Proxy address used for outgoing SIP calls. The address can be specified in the following ways:</p> <ul style="list-style-type: none"> <li>• If left blank, the ITSP Domain Name is used and is resolved by DNS resolution in the same way as if a DNS address had been specified as below.</li> <li>• An IP address.</li> <li>• A list of up to 4 IP addresses, with each address separated by a comma or space. <ul style="list-style-type: none"> <li>- The addresses can include an indication of the relative call weighting of each address compared to the others. This is done by adding a <b>w N</b> suffix to the address where <b>N</b> is the weighting value. For example, in the list 213.74.81.102w3 213.74.81.100w2, the weighting values assigns 1.5 times the weight of calls to the first address. The default weight if not specified is 1. A weight of 0 can be used to disable an address. Weight is only applied to outgoing calls.</li> </ul> </li> </ul> <p>If there is more than one proxy defined, and no weight indication, then calls are only sent to the first in the list until there is a failure at which point the next proxy is used.</p> <ul style="list-style-type: none"> <li>- If the <b>Calls Route via Registrar</b> setting below is enabled, the weighting is applied to registrations rather than calls.</li> <li>• A DNS address, for example sbc.example.com. <ul style="list-style-type: none"> <li>- The DNS response may return multiple proxy addresses (RFC 3263). If that is the case, the system will resolve the address to use based on priority, TTL and weighting information included with each address.</li> <li>- A load balancing suffix can be added to specify that multiple proxy results should be returned if possible, for example sbc.example.com(N). where <b>N</b> is the required number of addresses from 1 to 4.</li> </ul> </li> </ul> <p>This field is mergeable. However, no more than 4 IP Addresses should be in use at any time. So, if the combined new and old address settings exceed 4, the new addresses are only phased into use as transactions in progress on the previous addresses are completed.</p> |
| <b>Network Configuration</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
